LECTURES ON CONVERSATION

VOLUME II

Harvey Sacks, c.1967

Harvey Sacks, c. 1968

Contents

Part III   Spring 1966

Part VII Spring 1968

Contents

Introduction

The publication of these lectures makes publicly available virtually all of the
lectures by Harvey Sacks on conversation and related topics in social science.
Most of the lectures in this larger corpus were originally delivered to classes at
the University of California – first to sociology classes at the UCLA campus,
and then (beginning in Fall 1968) to classes in the School of Social Science at
the Irvine campus of the University.

Although Sacks produced copious analytic notes, many of which served as
materials for his lectures, what is presented here are the lectures themselves,
transcribed from tape recordings. Almost all of Sacks' lectures were initially
transcribed by Gail Jefferson, although most of the material for Fall
1964–Spring 1965, in that it antedates either her contact with Sacks and this
work, or her undertaking to transcribe the lectures, was intially transcribed by
others. With one exception (Sacks, 1987 [1973]), it is also Jefferson who has
edited those lectures which have previously been published, as well as the
lectures published here.[1] As noted in her introductory notes to the several

---

[1] Of the lectures published here, the set for 1964–5 were published in a special
issue of the journal *Human Studies*, 12, 3–4 (1989), and of those, the following had
been previously published elsewhere, edited by Gail Jefferson:

Fall 1964–5, lecture 5 has been published under the title 'You want to find out
if anybody really does care' in Button and Lee (1987: 217–25).

Winter 1964–5, lecture 14 has been published under the title 'The inference
making machine: notes on observability' in van Dijk (1985: 13–22).

Other than the 1964–5 lectures, the following lectures have been previously
published, also edited by Jefferson:

Spring 1966, lecture 18 (and related material in Fall 1965, lecture 7), under the
title 'Hotrodder: a revolutionary category,' in Psathas (1979).

Spring 1966, lecture 13, under the title 'Button-button who's got the button,' in
Zimmerman and West (1980: 318–27).

Spring 1966, lecture 24 (with excerpts from Fall 1967, lecture 14; Winter 1970,
lecture 2; and Spring 1970, lecture 3), under the title 'On members' measurement
systems,' (Sacks, 1988/89).

'lectures' and in Appendix II in her editor's notes to the previous publication
of the 1964–5 lectures in the journal *Human Studies*, those lecture-texts have
been pieced together from several sets of lectures which Sacks gave during the
1964–5 academic year, to make a more coherent and readable document.
These early 'sets' of lectures are full of gaps, and it is not always clear just
when some lecture was given. Accordingly, the reader should bear in mind
that this presentation of Sacks' early lectures cannot be used to track the
development of themes over time, to trace what topics or themes appear to
have been related in Sacks' thinking, etc.

Otherwise, it needs to be said at the outset with respect to the present
edition that the editorial undertaking has been monumental and its execution
heroic. This the reader can only partially see, for what has not been included
is, for that reason, not apparent, nor is the work of sorting and collating what
is made available in these volumes. This work has, as a matter of course,
involved divergences of several kinds from the texts of these lectures which
have circulated in various forms of reproduction over the years. These are
largely stylistic in nature, and are clearly designed to render the text more
accessible, more readable, and more consistent in stance, point of view, diction,
etc.[2] On occasion, however, these textual adjustments could be misread as
taking a stand on an analytic matter which Sacks otherwise addresses, could be
given a 'political' reading, or could appear to have a 'political' upshot, and it
would be well for the reader to be alerted to such possibilities.

By 'taking a stand on an analytic matter which Sacks otherwise addresses'
I mean to call attention to such adjustments in diction as one in which Sacks
follows an excerpt from a group therapy session by referring to one of the
speakers as "this fellow Dan" (in the originally circulated transcript of the
lecture), a reference which is in the present edition rendered as 'the therapist.'
Sacks takes up the issue of the description of persons, and category-ascriptions
such as 'therapist/patient,' on several different occasions in these lectures and
in several papers. Because of the options available for formulating persons,
particular choices of descriptors or identification terms served, in Sacks' view,
to pose problems for analysis, and could not properly be invoked or employed
in an unexamined way. Accordingly, no particular claims should be under-

---

Winter 1970, lectures 1 and 2, under the title 'Some considerations of a story told
in ordinary conversations,' (Sacks, 1986).

Spring 1970, lecture 1 (with excerpts from Winter 1970, lecture 2; Spring 1970,
lecture 4; and Spring 1971, lecture 1), under the title 'On doing being ordinary,' in
Atkinson and Heritage (1984).

Fall 1971, lectures 9–12, under the title 'Some technical considerations of a dirty
joke,' in Schenkein (1978).

In addition, extracts from a number of lectures have been assembled by Jefferson
as 'Notes on methodology,' in Atkinson and Heritage (1984: 21–7).

[2] Cf. the editor's notes by Gail Jefferson (Jefferson, 1989), and, in the present
edition, footnotes at Fall 1964–Spring 1965, lecture 2, p. 18; Spring 1966, lecture
04.a, p. 281; Winter 1969, lecture 7, p. 120; as well as Appendix A to lectures for
Fall 1964–Spring 1965, and Appendix B to lectures for Spring 1966.

stood as implied by occasional references to participants by such category terms in the current text (cf. the editor's Appendix A, Spring 1966).

By 'political' I mean, in this context, a relative positioning by Sacks of himself, his undertaking, his colleagues, his students, other contemporary intellectual undertakings, the established contours of the disciplines (sociology, linguistics, anthropology, etc.) and their groupings (e.g., the social sciences), the physically present class to which he was ostensibly addressing himself [3] and the like. Deployment of the pronouns 'we,' 'you,' 'they' and the like can serve to express varying sorts of solidarity and differentiation, and different ways of 'partitioning the population' (as he used to put it).[4] This was a matter to which Sacks was sensitive, having written a paper in graduate school only a few years earlier on Durkheim's use of 'we' in *The Elementary Forms of the Religious Life*, an echo of which appears in lecture 33 of the Spring 1966 lectures. Where the text suggests such alignments, readers should exercise caution.

It must also be recalled that the omission of some lecture sets in the present edition, and the transposition of some lectures from one set to another, requires that caution be used in basing an analysis of the appearance and development of themes, ideas and discussions of data fragments on this edition alone. The full texts of prior versions of all the lectures will be available through the Sacks Archive at the Department of Special Collections of the UCLA Library.

These cautions aside, it should be said that one cannot really retrieve Sacks' 'voice' from the text as presented here. In the interest of readability and of the accessibility of the content, what was sometimes a real challenge to discursive parsing – even to his closest friends and colleagues – has been smoothed out. Gone are the often convoluted phrasing, the syntax that might or might not come together at the end, the often apparently pointillistic movement from observation to observation – sometimes dovetailing at the end into a coherent argument or picture, sometimes not. The very long silences, of course, were lost in the transcribing process.

But Sacks himself treated his habits and manners, his attitudes and convictions, as 'private' (as he puts it in response to a question as to whether he is 'convinced' that single events are studyable after the general introductory lecture, Fall 1967, "That's such a private question"), and not really relevant

[3] Cf. the lecture of April 2 in the Spring 1971 lectures, on Sacks' notion that he was really talking to colleagues, friends and 'students' wherever they might be who were interested in his current work and not necessarily to the class actually in the room.

[4] For example, in lecture 6 of the 1964–5 lectures an alignment may seem to be implied in which Sacks identifies himself with the physically present students in criticism of "all the sociology *we* read," whereas the text of the lecture as previously circulated had read "all the sociology *you* read . . ." (emphases supplied).

See Appendix A to the Fall 1964–Spring 1965 lectures for the editor's account of Sacks' use of personal pronouns such as 'you,' 'I' and 'we' in the lectures, and of her editorial practices for changing some of these references in preparing this edition.

to what he felt merited the attention of others in what he had to say. It is that which these volumes present. As quickly becomes apparent from the texts of the lectures, we have yet to take the full measure of the man.

These series of lectures present a most remarkable, inventive and productive account of a strikingly new vision of how to study human sociality. With but a few exceptions, the students who sat in the rooms in which the lectures were delivered can hardly have known what they were hearing. The lectures were addressed to non-present students, to those who might come to know what to make of them. That audience continues to grow.

Under what circumstances were these lectures delivered and recorded? What is their intellectual and scientific context? What is most notable in them? These matters cannot be dealt with comprehensively here, but a brief treatment, in a mixed genre which might be termed an 'introduction/ memoir,' can help provide an overview and some setting for what is increasingly recognized as a startlingly original and important address to the social organization of mind, culture and interaction.

I

Sacks received his AB degree in 1955 after three years at Columbia College. In later years, Sacks would reminisce with partly feigned and partly genuine awe about the faculty at Columbia – Jacques Barzun, Meyer Schapiro, Lionel Trilling, various students and former students of Franz Neumann such as Julian Franklin and Peter Gay (and Neumann himself, who, however, may well have not been teaching undergraduates when Sacks was there), although it was never entirely clear with which of these 'eminences' Sacks had himself studied.[5]

Although he did not officially 'major' in sociology, Sacks' education was influenced in an important way by C. Wright Mills. The influence was not channeled primarily through course work; most important to Sacks was that Mills secured for him a faculty-authorized access to the stacks of Butler Library and turned him loose on his own. But Sacks would later say that from Mills he had learned 'audacity.'

In spite of the predominantly socio-cultural cast of the faculty who figured most centrally in Sacks' later reminiscences, the two closest college friends with whom Sacks kept in touch later on were both biologists.

Upon graduation from Columbia, Sacks was awarded a scholarship at Yale Law School where he earned his LLB in 1959. While at Yale, he participated in the group around Harold Lasswell, and became more interested in understanding how the law as an institution worked, how it *could* work, than

---

[5] I recall an account of how students would celebrate if they achieved grades of 'A' from Trilling or Schapiro, but it was unclear, at least to me, whether Sacks himself had been one of those students.

in making it work as an attorney himself.[6] He went looking for intellectual resources with which to pursue this interest and turned first to Cambridge, and to the work of Talcott Parsons in particular (although formally he was enrolled as a graduate student in Political Science at MIT, and was employed as a research assistant in the Department of Economics and Social Sciences there). But what he found in Cambridge that was most consequential for the subsequent development of his thinking was not Parsons (and not Chomsky, some of whose lectures at MIT he attended), but rather Harold Garfinkel.

Garfinkel was spending a sabbatical leave from UCLA at Harvard, where he had himself earned his Ph D a number of years earlier. Sacks and Garfinkel met at Parsons' seminar in Cambridge, and were immediately attracted by each other's seriousness. Their intellectual relationship was sustained until the early 1970s. However, in 1959–60, when it became clear to Sacks that the solutions to the problems he had set himself were not to be found in Cambridge, he followed his law school teacher Lasswell's advice, and decided to pursue graduate work in sociology at Berkeley.

Berkeley appealed on several grounds. Laswell had suggested that Sacks pursue his interests through the continuing study of labor law and industrial relations. An attractive locale was furnished by the Institute of Industrial

---

[6] Sacks once recounted a story which provides some insight into the appeal which Garfinkel's work must have had for him when he later encountered it.

He was engaged in a discussion with several other law school students arguing through some problem in case law which they had been set – a problem in torts, if I remember correctly. The issue was whether or not a person on the ground was entitled to recover damages incurred from the overflight of his property by an airplane. At one point, in a kind of mimicry of the 'how many hairs make a bald man' paradox, the students coped with the argument that no damages could be collected if the plane was being piloted in a proper and accepted manner by seeing how far they could press the definition of what was 'proper.' What if it were flying at 2,000 feet? At 1,000 feet? At 250 feet? At 5 feet? Sacks reported that when the last of these proposals was offered, it was dismissed as 'unreasonable,' as frivolous, as violating the canons of 'common sense.' But, he pointed out, that could as well have been said about the penultimate one, but wasn't. What struck him, then, and puzzled him, was that the 'legal reasoning' which was the much heralded instrument in whose use they (students of the law) were being trained rested on, and was constrained by, an infrastructure of so-called 'common sense' which was entirely tacit and beyond the reach of argument, while controlling it. And, in that legal reasoning was something on which the entire legal structure rested (and not just particular areas, such as torts, contracts, crimes, etc.), how the law as an institution actually worked, what made it work the way it did, what restrained its reasoning from pressing the law in other directions, was shrouded in mystery. Undoubtedly, this was only one of the puzzles about how the law could work which engaged Sacks' interest, but it is one for the solution of which Garfinkel's work on methods of commonsense reasoning and practical theorizing, then in progress, would have been an attractive resource.

The issue prompted by this law school incident gets articulated explicitly for its bearing on working with recorded conversational materials at the beginning of lecture 1 for Fall 1971; cf. volume 2 of the present edition.

Relations at Berkeley, and in particular by Philip Selznick whose interest in organizations and bureaucracy was complemented by a developing interest in legal institutions. (Indeed, several years later Selznick was to establish the Center for the Study of Law and Society at Berkeley, and Sacks was to be among its first graduate fellows.) But Berkeley was attractive on other counts as well. Aside from its having developed one of the strongest sociology departments in the country, Sacks was attracted by the presence of Herbert Blumer, whose SSRC monographic critique (1939) of Thomas and Znaniecki's *Polish Peasant in Europe and America* Sacks had found penetrating. (Sacks lost interest in Blumer soon after arriving in Berkeley, and did not study with him at all.)

It is worth pausing a moment to recall where some of the relevant American social sciences stood during these formative years of the late 1950s and early 1960s, at least as they appeared to graduate students, to *some* graduate students, to *the* graduate students who figure in this account.

There had not yet been the rise to professional visibility of a radical sociology. C. Wright Mills' *Sociological Imagination* was still a daring manifesto, his *Power Elite* still a model inquiry. Theory was predominantly (as it was then called) 'structural-functionalist' and especially Parsonian. 'Empirical' sociology was still predominantly 'Columbia-oriented' rather than 'Chicago-oriented;' data analysis was multivariate, not regression-based. Blau and Duncan's *The American Occupational Structure* was still half a decade to a decade away. And social psychology was in large measure a choice between 'small groups' of the Bales variety or of the Michigan group dynamics variety, a substantial dollop of 'public opinion' or 'attitudes' research, with a minority voice somehow identified – often wrongly – with symbolic interactionism: Blumer at Berkeley being the most visible – or vocal – representative, Goffman (*The Presentation of Self in Everyday Life*, published in the United States in 1959) just beginning to be recognized, Becker still largely unknown.

In anthropology, the Gumperz/Hymes special issue of the *American Anthropologist* was not to appear until 1964, ethnoscience and componential analysis were just coming into their own, the ethnography of communication was just beginning to recruit its hoped-for army to canvas the world.

In linguistics, Chomsky's *Aspects of the Theory of Syntax* was not published until 1964, outsiders were just registering the import and impact of his review of Skinner's *Verbal Behavior* and his *Syntactic Structures* (1957). Linguistics was just beginning to establish a track record for its significance to other disciplines.

Throughout his stay in Berkeley, Sacks remained in touch with Harold Garfinkel (now returned to his home base at UCLA) whose program of ethnomethodological studies was being developed in a series of writings which were privately circulated for the most part in mimeographed form. (It should be recalled that it was not until 1959 that Garfinkel's 'Aspects of the problem of commonsense knowledge of social structure' was published – and not in a broadly accessible outlet at that; not until 1960 for 'The rational properties of scientific and commonsense activities,' also not in a source generally read by

sociologists; not until 1964 that 'Studies of the routine grounds of everyday activities' appeared in *Social Problems*; and not until 1967 that *Studies in Ethnomethodology* was published.) It was largely through Sacks that these manuscripts came to be circulated in Berkeley, largely among graduate students in sociology. Of course, Sacks did not only circulate Garfinkel's manuscripts; in discussions among the students he added the special directions of his own thinking, in some respects converging with Garfinkel's, in other respects quite distinctive.

At the time, Garfinkel was co-principal investigator with Edward Rose of the University of Colorado on a research grant which supported a series of conferences in Los Angeles in which Sacks took part. So Sacks' engagement with Garfinkel's manuscripts in northern California was complemented by more direct, personal engagement in the south. At the same time, other developments were in progress in both north and south; in the north, for example, Selznick had brought into his new Center for the Study of Law and Society a number of graduate students in the social sciences, and especially sociology. During the 1962–3 academic year, this group included Sacks, David Sudnow and the present writer, whose activities separately and together were to contribute to future developments, but are not directly in point here.

In 1963, Garfinkel arranged for Sacks to move to Los Angeles. He was to have an appointment as Acting Assistant Professor of Sociology at UCLA, with the first year off. During that year, 1963–4, Garfinkel and Sacks[7] were to serve as Fellows at the Center for the Scientific Study of Suicide in Los Angeles, under the sponsorship of its director, Edwin Schneidemann. As it happens, my own work prompted a move from Berkeley to Los Angeles during the summer of 1963, and Sacks and I continued both a work and a personal relationship during that year. I can therefore describe, at least in brief compass, his primary intellectual preoccupations during the year. A great many of them had his involvement with the Suicide Prevention Center as a point of departure, thereafter taking the often surprising directions which his distinctive mind imparted to them. In diverse ways, these interests show up in his first ventures in teaching, the 1964–5 lectures which provided the point of departure for the further development of the work, presented in the subsequent lecture series published here.

One line of these concerns focussed on an examination of psychiatric, and especially psychodynamic, theorizing, which furnished one primary theoretical handle on the phenomenon of suicide at the SPC, and which, more particularly, was key to the so-called 'psychological autopsies' which were conducted following suicides and which were of very great interest to both Sacks and Garfinkel. Thinking about psychodynamic theorizing led Sacks (as it had led me; cf. *Berkeley Journal of Sociology*, 1963) to a concern with dialogue, and in particular with Platonic dialogue as a form of discourse designed to control conduct. That, in turn, led him to a more general interest

---

[7] And Erving Goffman, visiting on an occasional basis from Berkeley.

in Greek philosophy, and particularly in Greek logic (on which he was reading, among other sources, Kneale and Kneale's *The Development of Logic*, 1962).

From the Freudian theorizing, from a prior interest in 'children's cultures' set off by the work of the Opies (1959), and from a persistent attention to the problems posed by the apparent facts and achievements of socialization, there developed an interest in the behavior of children. This interest Sacks pursued largely through examination of source books on children's games (an interest prompted as well by the work of O. K. Moore on games as 'autotelic folk models;' cf. Anderson and Moore, 1960), of the studies and protocols of Barker and Wright (1951, 1954), in observational studies Sacks acquired from Roger Brown, and other sources.

And Sacks pursued a number of other scholarly interests, in biblical studies and interpretation, in translation, in archaeology, etc. In a very different vein, Sacks came across stenographic transcripts, and then the tapes, of the telephone calls to the Suicide Prevention Center of, or about, suicidal persons. All of these themes may be found in the 1964–5 lectures, but it was the last of them which provided the proximate source for the focussed attention on talk itself – perhaps the most critical step toward the development of conversation analysis.

Throughout the 1963–4 academic year, Sacks and I continued the discussions and explorations entered into in Berkeley during the preceding year and a half. This is not the place for a substantial account of those activities (on-site explorations of the possibilities of field observation at the Los Angeles International Airport, in the reference room of the UCLA library, at neighborhood 'Okie' bars in Venice, and elsewhere; long discussions on the UCLA campus where I was a visiting scholar, at the beach in Venice where he lived, or at the apartment at the fringe of Beverly Hills where my wife and I lived). But it may be of interest to describe what seemed to me at the time something quite new, and seems to me now in retrospect the first appearance of what would eventually become, after a number of major transformations, what is now called 'conversation analysis.'

It was during a long talking walk in the late winter of 1964 that Sacks mentioned to me a 'wild' possibility that had occurred to him. He had previously told me about a recurrent and much discussed practical problem faced by those who answered phone calls to the Suicide Prevention Center by suicidal persons or about them – the problem of getting the callers to give their names. Now he told me about one call he had seen/heard which began something like this:

> *A*: This is Mr Smith, may I help you.
> *B*: I can't hear you.
> *A*: This is Mr <u>Smith</u>.
> *B*: Sm<u>i</u>th.

After which Mr Smith goes on, without getting the caller's name. And later,

when Mr Smith asks for the caller's name, the caller resists giving it. On the one hand, Sacks noted, it appears that if the name is not forthcoming at the start it may prove problematic to get. On the other hand, overt requests for it may be resisted. Then he remarked: Is it possible that the caller's declared problem in hearing is a methodical way of avoiding giving one's name in response to the other's having done so? Could talk be organized at that level of detail? And in so designed a manner?

A month or two later, I arrived home at our apartment in the late afternoon, to find Sacks waiting for me there. A transient difficulty with Garfinkel had led him to realize that, if not on the present occasion then at some future time, he might have to fend for himself in the academic marketplace and had better have some written work to show. So he had drafted the sketches of two papers. I left him talking to my wife in the living room and retreated to my study and read the sketches. One of them was about a methodical way of avoiding giving one's name. As the reader who turns to the 1964–5 lectures will soon discover, this is where Sacks' lectures began (not only in the composite version assembled for this publication, but in the original as well).

Why might this episode, and these observations, be treated as the beginning of what would come to be called 'conversation analysis'?[8] Because

[8] In the 'General Introduction' lecture for Fall 1967, (p. 621), Sacks introduces the work to be presented by describing "When I started to do research in sociology . . ." It is unclear what Sacks means to refer to: when he went to Cambridge? to Berkeley? sometime during graduate school? in Los Angeles? are these the right terms to locate the reference?

In a way, the 1963 paper 'Sociological description' is not incompatible with the account offered in this Fall 1967 lecture, except for the description (p. 622) of starting "to play around with tape recorded conversations," which surely did not happen until the year at the Suicide Prevention Center. Until then, friends of Sacks will remember occasions of sitting 'with him' in some public place and suddenly realizing that Sacks was no longer in the same interaction, but was overhearing a nearby conversation, and often taking out the omnipresent little multi-ring notebook and jotting down a fragment of the talk and some observations about it. The virtues of "replay[ing] them . . . type[ing] them out somewhat, and study[ing] them extendedly" (Fall 1967, ibid.) were realized against a long experience of such overhearing and notetaking. (One shared experience which may have alerted Sacks to the payoffs of taking materials like the SPC tapes seriously was my experience during 1962–3 in Berkeley at the Law and Society Center of tape recording psychiatric competency and criminal insanity examinations for subsequent analysis.)

But it is worth noting that Sacks did not set out to study conversation or language in particular. His concern was with how ordinary activities get done methodically and reproducibly, and the organization of commonsense theorizing and conduct which was relevant to those enterprises. Clearly, he found talk, or what was being done through talk, of interest before coming upon taped materials – else he would not have been jotting overheard bits in notebooks. But the taped material had clear attractions when it became available as a resource, and the talk invited being dealt with as an activity in its own right. But that was something that turned out from experience, not something that had been aimed at, or 'theoretically projected.'

there is the distinctive and utterly critical recognition here that the talk can be examined as an object in its own right, and not merely as a screen on which are projected other processes, whether Balesian system problems or Schutzian interpretive strategies, or Garfinkelian commonsense methods. The talk itself was the action, and previously unsuspected details were critical resources in what was getting done in and by the talk; and all this in naturally occurring events, in no way manipulated to allow the study of them. And it seemed possible to give quite well-defined, quite precise accounts of how what was getting done was getting done – methodical accounts of action.

   This was just the start of a long train of quite new things that Sacks was to provide. It was only a little over a year later that the eventually published version of 'An initial investigation . . .' (1972a) was completed. It is hard now to appreciate how startlingly new and unprecedented that paper was at the time. If one recalls the publication history of Garfinkel's work (and that Goffman's *Behavior in Public Places* was published in 1963, and *Relations in Public* was not to be published until 1971), a sense of its uniqueness when it was published in 1972 might be somewhat more accessible. Its utter originality in 1964–5 when it was being written, and the originality of the materials in the first of these lectures which were delivered around the same time, may be better grasped by reference to this other work. With the current wisdom of hindsight, of course, our sense of this early work of Sacks' is readily assimilated to the direction we now know such studies took. But the originality was not only startling in 1964 and 1965; it had the additional headiness – and vertigo – of indeterminateness: How might one proceed? What sort of discipline was this or might it be? Once a previous sense of plausibility about the depth and detail of organization in conduct and apperception of the world were set aside, what constraints on inquiry were defensible? To what level of detail was it sensible to press?

   During the summer of 1964, I left Los Angeles for the mid-west, wondering what ever Sacks would do about lecturing to UCLA undergraduates, and wondering as well how our contact could be sustained. The latter problem was solved in part by a variety of resources that allowed me recurrent trips to California during the 1964–5 year (though less so in ensuing years), and in part by a practice which also satisfied my curiosity in the first respect. Sacks would tape record his lectures and send them to me, and (if I remember correctly) to David Sudnow who was spending the year in St. Louis, doing the field work for his dissertation, later to appear as the book *Passing On* (1967). At irregular intervals I would receive in the mail a little orange box with a yellow label, containing a three-inch reel of tape, enough for the 50-minute lectures (more or less) which Sacks was delivering. The lectures were for me, then, a rather special form of monologic telephone call interspersed with our dialogic ones (which were not recorded), and then, after Gail Jefferson started transcribing the lectures, they were a sort of long letter series.[9] It turns out that

   [9] At the time they were being delivered, I encountered the lectures term by term, like long analytical letters from Sacks. I had little overall view of them and of their

they became Sacks' most successful and prolific form of scientific communication.

When he wrote papers, Sacks imposed standards of formality and precision that were extremely hard for him to meet to his own satisfaction. Most of the papers he published under his own name alone were work-ups of lectures.[10] Most of the papers he drafted on his own as papers he was never sufficiently satisfied with to publish. The exceptions, 'An initial investigation . . . ' or 'On some puns, with some intimations' give some idea of what Sacks thought a finished piece of work might look like.

Aside, then, from his collaborative publications, the lectures are the vehicle by which most of his work was made available. Perhaps it was the explicitly and necessarily informal and limited character of the occasion that could allow him to get 'the stuff' out the best he could, with no pretense to finally getting it 'just right.' Those who have seen some of his successive versions of the 'same pieces' will know how great a change could overtake some piece of work under the guise of getting it just right.[11] But the quality of what was delivered in those lectures, and in those which followed, and the

---

overall development, of long term changes in the work reflected in them, etc. This was largely because such changes would have come up in, or (without necessarily being explicitly discussed) informed, our conversations with each other in the interim between shipments, or could not be recognized for the changes they represented until later developments. Largely, then, my reading was marked by my being struck, charmed, and often amazed at what Sacks' sleight of hand could materialize out of a bit of data, the twist he could impart – no, discover – in it, the tacit understandings he could, by a flash of insight, show we ('casual' readers or onlookers) had furnished it. Sometimes the 'twist' assumed the proportions of a whole analytic topical area – e.g., storytelling structure. I came to the reading of each new 'package' with a kind of avid curiosity about what sorts of new things – whether unexpected observations about a moment or whole new analytic issues – were tucked into those pages, and the reading proceeded from flash to flash. It was like watching one's athletic friend show what he could do.

Preparation of this publication and this introduction has afforded me the occasion for a larger overview, or series of overviews – of each set of lectures and of the set of sets. In them I am brought to recall or to discover in retrospect larger scale movements and changes, emerging and waning themes. Of course, this is refracted through my own experience and intellectual colleagueship with Sacks. I have tried to strike a balance between that kind of perspectival account and a less personalized overview and setting-into-context.

[10] Cf. for example, the paper on story-telling (1974). The paper on puns (1973) is an exception here, having never been fully worked up as a lecture before being prepared for the Georgetown Round Table, in whose proceedings it was published. 'Everyone has to lie' (1975) was adapted from a lecture, but the materials for the lecture were initially drafted as a paper, under the title 'The diagnosis of depression,' which was never published in its original 'paper' format.

[11] See the initial two lectures of the Spring 1966 term presented in this edition with Sacks' first effort at revision, at pp. 236–46 below, for a sample. In this case, a virtually identical version of the same material was eventually published as 'On the analyzability of stories by children' (Sacks, 1972b).

special vision that underlies it, did not require getting it 'just right' to be apparent.[12]

Although he continued to tape a variety of research and teaching activities, Sacks stopped recording his lectures in 1972 for a number of reasons. Some of his lectures at the Linguistic Institute of 1973 at the University of Michigan were recorded, as were some of the sessions of the joint seminar we taught, but these were not recorded by Sacks, and were not reviewed for transcription by him.

Harvey Sacks was killed in an automobile accident in November 1975 while on his way to the campus of the University of California, Irvine where we were to meet to formulate a program which we were discussing establishing at the Santa Barbara campus of the University. One can hardly imagine what the next years of Sacks' intellectual life would have produced, especially in an academic environment fully supportive of the enterprise which had already developed.

II

The 'first installment' of these lectures – the ones delivered during the 1964–5 academic year – can be furnished with two sorts of intellectual reference points – ones in Sacks' own intellectual development and ones in the intellectual context around him.

In his own thinking, these lectures come after his paper 'Sociological description' (1963), written in 1962–3 in Berkeley[13] and during the same period as 'An initial investigation . . .' (1972a) which was finished in June 1965.[14]

Several features of these early papers which serve as landmarks in Sacks' intellectual terrain, and of the early lectures, display some of the most potent influences on his thinking at that time. There is first of all a wide-ranging responsiveness to Garfinkel's thematics, broadly acknowledged in a footnote to 'Sociological description' (1963: 1), and in recurrent notes in the early writings and lectures. A thorough treatment of the influences here, I daresay the reciprocal influences at work here, remains to be written. At a different level, there is the transparent allusion to the later Wittgenstein embodied in

---

[12] Still, readers should bear in mind the in-progress status which this work had for Sacks. While still alive, he expressed a willingness to have the lectures published, if the publication could be done without much editing, not only because he did not want to spend the time, but also to avoid masking the work-in-progress nature and status of the effort. It should be a way of getting 'a lot of stuff' noticed, without suggesting what should in the end be fashioned from it. The lectures were not meant to look finished.

[13] See the discussion below of the Spring 1966 lectures, and of 'possible description' in particular.

[14] Cf. the initial footnote to the version published in Sudnow (1972b).

the invention (ibid.) of the 'commentator machine' as a grand metaphor for (variously) the relationship of social science discourse to the social world which is its object, of commonsense or lay talk about the world to ordinary enactments of it, etc.

Perhaps less expectable in the contemporary academic setting, in which studies of discourse and conversation are often set in contrast to transformational grammar, is the echo of generativist studies in the form of some of this early work, and especially in the form of its problem development. Take as a case in point 'On the analyzability of stories by children' (1972b, revised from the first two lectures for Spring 1966, but first worked up as lectures 1 and 2 for Fall 1965).

The data for that set of lectures and publication, it will be recalled, were taken not from ordinary conversation, but from the response of a young child to a request by an adult for a story. Most relevantly for the present discussion, this had the consequence that there was no ensuing talk by a co-participant which could be examined to reveal an understanding of the 'story' which was 'indigenous' to the interaction, along the lines exploited in later conversation-analytic work. In its place, Sacks relied on his understanding of the text being examined ("The baby cried. The mommy picked it up"), and the understanding which he attributed to his audience – understandings not overtly provided for by the text itself (for example, that 'the mommy' is the mommy of that baby, although the story as told by the child was expressed as '*the* mommy picked it up').

The problem, as Sacks developed it, was to build 'an apparatus' that would provide for such hearings or understandings, and would serve both as a constraint on them and as a research product to which they could lead. This form of problematics, of course, echoes the commitment to build a syntactic apparatus which would provide for the alternative parsings of a claimedly ambiguous sentence such as 'Flying planes can be dangerous' (Chomsky, 1957). The reader is first asked to recognize that alternative 'structural interpretations' can be assigned to this sentence, and then to be concerned with the construction of a syntax that produces such an ambiguity and provides for its disambiguation. To be sure, this form of problem development and statement is invoked by Sacks on behalf of a quite different intellectual and scientific enterprise, but the formal similarities in the problematics seem clear enough.[15] (And connections appear in other guises as well, for example, in the

[15] See the comments on the Fall 1965 lectures for further discussion of the relationship to generative grammar studies.

In this regard as well, John Heritage has called to my attention an exchange involving Sacks and others at the Purdue Symposium on Ethnomethodology, in which he remarks in response to several inquiries (Hill and Crittendon, 1968: 41–2),

One of the things that is obvious from the kind of analysis I have given you is that there can be a set of rules which can reproduce the problems in the data with which you started ... [Query: How do you become satisfied with a solution?] ... I have a set of rules which give me back my data.

extensive paragraph numbering system which is used to organize 'An initial investigation . . .' as well as the 'Introduction' of 1965 printed in this volume), a format hardly familiar to sociologists at all, but in common practice in linguistics at the time, though Sacks may well have come to it initially through his study of the law).

I think it characteristic of Sacks' relationship to work which he respected that it would enter into the warp and woof of his own thinking and would shape the way he did his work. And this is so not only in this formative stage of his work. Later on (in the work published in Schenkein (1978) but delivered as lectures 9–12 in Fall 1971), for example, his argument that the obscenity in a dirty joke is not its point, but is rather a form of 'circulation control' on knowledge which is packed or tucked in elsewhere, not overtly labelled or featured as the point of the joke, brings to bear a form of analysis developed by scholars of classical Greece such as Milman Parry (1971) and Eric Havelock (1963) in work on the role of the Homeric epics in an oral culture and its transformation in the passage from an oral to a literate culture.

Another case in point is furnished by Cressey's work on embezzlement (1953), which served Sacks (in 'An initial investigation . . . ,' 1972a) not to constitute the problem or suggest the shape of a solution, but as a way-station in the substantive analysis. Cressey had proposed as a key to understanding embezzlement that its perpetrators all had 'a nonsharable problem.' In Sacks' effort to come to terms with the assertion by some avowedly suicidal persons that they had 'no one to turn to,' he proposed as a proximate solution that these persons found that what troubled them would, if recounted to the ones they would properly turn to (e.g., spouse), undermine the very relationship that made them 'turnable-to;' that is, precisely, they had a 'nonsharable problem.' But for Sacks this merely served to pose a problem: how to formulate the terms of the 'search for help' that yielded these persons as the candidates to be turned to, and therefore yielded the result that a problem not sharable with them left the searcher with 'no one to turn to.' And that recasting of the problem led to the central contribution of that analytic undertaking – the formulation of 'membership categorization devices' and their features.[16]

Sometimes Sacks would cite such sources. More often, the shape of the problem formation or solution, or the analytic resource, had simply entered into the currency of his thinking, and its source was lost sight of, especially in the context of lectures to undergraduate courses. The lecture format is, in this regard, 'informal.' Although published work which is, taken as a whole, remote from his concerns is often quoted directly and/or cited by name (e.g., Freud, Gluckman, Von Senden), more intimately related work is often not,

[16] In the paper presenting this work (Sacks, 1972a), the analytic ordering given in the text here is reversed. The paper begins with the most formal and general posing of the issues of categorization, and only eventually arrives at the more proximate, situated problem, as a 'derivation,' i.e., the dilemma presented when what qualifies another as the proper person to turn to will be compromised by the very turning to them.

as for example (to cite an early instance in the text which follows) in the discussion of 'common knowledge' in lecture 3 of the 1964–5 lectures (as printed herein), for which Garfinkel clearly was relevant. In the preparation of these lectures for the present publication, that practice has not been addressed; it is a characteristic feature of the form in which Sacks' work was shaped for presentation.

As unexpected as may be the appearance in Sacks' early lectures of echoes of the analytic style of transformational grammar, even more striking is the apparent lack of specific influences from the work of Erving Goffman. This is especially surprising since, during the years at Berkeley, Sacks took Goffman more seriously than he did virtually any other member of the faculty.

At a very general level, of course, Goffman's analytic enterprise had undertaken to establish the study of face-to-face interaction as a domain of inquiry in its own right, and his work was very likely central in recruiting Sacks' attention to face-to-face interaction as a focus for the concern with practical theorizing and commonsense reasoning which animated the eth-nomethodological enterprise. Surely Sacks' work, and work which it inspired, have been important to whatever success and stability this area of inquiry has achieved. And Sacks could treat Goffman's work as setting a relevant domain for students for pedagogical purposes; in the first of the Fall 1967 lectures, Sacks recommends readings in Goffman's work as the most relevant sort of preparatory reading for the course, and the most indicative of the general stance of the course, while explicitly differentiating his own work from it.

Goffman's influence on Sacks was at its peak during Sacks' years as a graduate student. While at Berkeley, for example, Sacks satisfied a requirement in one of Goffman's courses not with an empirical study of interaction of the sort chracteristic of his later work, but by writing the so-called 'police paper' (later published as 'Notes on police assessment of moral character,' 1972c), concerned with methods of commonsense theorizing about appearances and moral character, and based on handbooks and manuals of police procedure. The subsequently published version of the paper begins with a handsome acknowledgement of debt to Goffman's writing and lectures, and though the style and 'address' of the work differ in various respects from those of Goffman, the topic plays off of several themes recurrent in Goffman's work at the time, and the exploitation of handbooks and manuals echoes Goffman's use of manuals of etiquette and advice. But after this, Sacks' work diverges increasingly from Goffman's.

To be sure, in later work Sacks addressed himself to more specific interactional topics mentioned in Goffman's work (see, for example, the discussion of 'rules of irrelevance' in Goffman's essay 'Fun in games,' (1961: 19ff.), or the passing mention of turn-taking (Goffman, 1964: 136), but the lines of influence are often not entirely clear. Goffman is reported to have responded to a question years later asking whether Sacks had been his student by saying, "What do you mean; I was *his* student!" Leaving aside the possible elements of generosity, irony and flipness in such a remark (and assuming

that the report is, generally speaking, correct), a serious treatment of the directions of influence and the interplay of ideas between them remains to be written.[17]

That important divergences between Goffman and Sacks began to develop early on can hardly be doubted. These came to a head, both symbolic and practical, over Sacks' PhD dissertation, an episode which cannot be recounted here.[18] For now the upshot must remain this: although in retrospect Sacks seems clearly to have labored in the same vineyard, and although he was not only formally Goffman's student but learned a great deal from him, the degree to which Goffman influenced more specifically the work for which Sacks is known remains an open question. Certainly, such specific influences are not as much in evidence as most readers are likely to expect, either with respect to Goffman's most characteristic substantive concerns – face, demeanor, structures of attention and information, etc., with respect to governing themes – dramaturgic, ethologic, frame-analytic, etc., or with respect to data and method.

III

In mentioning genres of work and particular people who constituted a relevant intellectual ambience for the early corpus of Sacks' work, one name which might be thought missing is that of John Searle. But it turns out that Searle's work constitutes a parallel stream, not a source. Indeed, although his *Speech Acts* was published in 1969, his paper 'What is a speech act?' appeared in 1965, the same year as the first of Sacks' lectures. It is striking to compare the quite different tacks taken in these two approaches to the accomplishment of social action through the use of language, even if only in the brief and superficial way that space limitations compel.

Searle begins not with a particular utterance – either actually spoken or invented. He addresses himself rather to a class of utterances that would satisfy whatever is required for them to effectively – felicitously – accomplish the speech act of 'promising.' It is the type 'promises' that provides Searle his object of inquiry. The solution takes the form of stating the "conditions . . .

---

[17] Some considerations on the relationship between Goffman's work and conversation analysis may be found in Schegloff (1988). Goffman's most explicit engagement with conversation–analytic work appeared in *Forms of Talk* (1981), the earliest of whose essays dates to 1974.

[18] The upshot was that Goffman found the argument of 'An initial investigation . . .' circular, and no amount of discussion could move him from this view. Nor would he, for quite a while, step aside from the committee to allow its other members to act favorably on the dissertation, as they wished to do. Eventually, however, he agreed to do so, largely at the urging of Aaron Cicourel who, in the end, signed the dissertation as Chair of its sponsoring committee, making possible the awarding of the PhD in 1966.

necessary and sufficient for the act of promising to have been performed in the utterance of a given sentence" (i.e., a general definition of 'promise'), with a later derivation of the rules for performing acts of this class.

Readers may recall the sort of result yielded by proceeding in this manner – the formulation of preparatory conditions, sincerity conditions, etc., followed by "rules for the function indicating device for promising." The focus, then, is on the class or type of act, and the term describing it – 'promising.' It is not on particular utterances or the contexts in which they occur. Indeed, Searle's paper begins by invoking the most general context possible, "In a typical speech situation involving a speaker, a hearer, and an utterance by the speaker . . ."

Sacks' first lecture starts in a significantly different way (and although the original transcripts show a much more uneven presentation than appears in the edited version, in the manner of their opening they do not differ). Sacks begins by offering particular utterances in a particular context. Our attention is focussed from the outset on particular exchanges, such as *A*: "Hello," *B*: "Hello;" or *A*: "This is Mr Smith, may I help you;" *B*: "Yes this is Mr Brown;" or *A*: "This is Mr Smith, can I help you;" *B*: "I can't hear you," which are

> . . . some first exchanges in telephone conversations collected at an emergency psychiatric hospital. They are occurring between persons who haven't talked to each other before. One of them, *A*, is a staff member of this psychiatric hospital . . .

Sacks goes on to offer a variety of detailed considerations about what these utterances, "This is Mr Smith," "can I help you" or "I can't hear you" might be observed to be doing, and how they might be doing it. Then he remarks (lecture 1, pp. 10–11):

> Clearly enough, things like "This is Mr Smith," "May I help you"? and "I can't hear you" are social objects. And if you begin to look at what they do, you can see that they, and things like them, provide the makings of activities. You assemble activities by using these things. And now when you, or I, or sociologists, watching people do things, engage in trying to find out what they do and how they do it, one fix which can be used is: Of the enormous range of activities that people do, all of them are done with something. Someone says "This is Mr Smith" and the other supplies his own name. Someone says "May I help you" and the other states his business. Someone says "Huh?" or "What did you say?" or "I can't hear you," and then the thing said before gets repeated. What we want then to find out is, can we first of all construct the objects that get used to make up ranges of activities, and then see how it is those objects do get used.
>
> Some of these objects [*recall that 'objects' here refers to the utterances which have been examined*] can be used for whole ranges of activities,

where for different ones a variety of the properties of those objects will get employed. And we begin to see alternative properties of those objects. That's one way we can go about beginning to collect the alternative methods that persons use in going about doing whatever they have to do. And we can see that these methods will be reproducible descriptions in the sense that any scientific description might be, such that the natural occurrences that we're describing can yield abstract or general phenomena which need not rely on statistical observability for their abstractness or generality.[19]

Nor (one might add) do they rely for their abstractness or generality on being stripped of all contextual particulars (in the manner of Searle's "In the typical speech situation . . .") or on the stipulation of general constitutive definitions of verbs for speaking.

The focus in Sacks' work here, and in much of the work of the ensuing years,[20] is not on general constitutive conditions, or even on rules in Searle's sense, but on practices and methods – on how Members, in particular contexts (or classes of context arrived at by examining particular contexts), methodically construct their talk so as to produce a possible instance of an action or activity of some sort, and to provide for the possible occurrence next of various sorts of actions by others.

Although the 1964–5 lectures exhibit some striking early explorations along these lines, a particularly exemplary instance of such an analysis is Sacks' discussion in lecture 4 of Spring 1966, of the utterance by a previously present participant, after a newcomer to a group therapy session of teenaged boys has been greeted, "We were in an automobile discussion," which Sacks undertakes to show to be "a possible invitation." (In later 'takes' of this analysis, the treatment is varied; for example, in Fall 1968, lecture 6, (volume II) he discusses it as 'orientational,' although all the analysis bearing on its 'invitational' aspect is included. This later discussion is rather fuller, more detailed and compelling.)

His undertaking – '. . . to build a method which will provide for some utterance as a recognizable invitation . . .'' – may sound like Searle's, but it turns out to be quite different. There are two component tasks. One of these tasks is

---

[19] The reference to "reproducible descriptions in the sense that any scientific description might be" is an appearance in this first lecture of a theme and argument which Sacks had been percolating for some time, and which was written up at the end of the 1964–5 academic year in a putative introduction to a publication which never materialized. (That introduction is included in this volume, and its argument is recounted below, at pp. xxx–xxxii.)

[20] When Sacks does introduce a shift to a rather more general form of undertaking, for example at lecture 3 of the Fall 1968 set, it still has quite a different character than Searle's.

... to construct ... "a partial definition of an invitation." What makes it partial is that while it's a way of doing invitations, it's not ... all the ways ... there are other ways and those would be other partial definitions.

The second task is to have this partial definition provide for the actual case which occasions the inquiry:

We want to do both: Construct a partial definition of 'invitation,' and one that provides for 'this is a case.'

It turns out that there are other things such an analysis should do, which need not preoccupy the present discussion.

The construction of the method that provides for the data under examination as a possible instance of 'invitation' has two parts. First, Sacks characterizes the 'slot' in which this utterance occurs, and characterizes it in various ways — as (1) just after introductions and greetings, (2) in the arrival of a newcomer to a conversation already in progress, (3) in a situation of a psychiatric neophyte coming to group therapy for the first time and joining more experienced patients, etc. Second, he characterizes one particular aspect of the utterance itself — its formulation of the topic preceding the newcomer's arrival as "an automobile discussion." He shows that that formulation makes relevant the common category membership of the newcomer and the others, but a category membership as "teenaged boys" or potential "hotrodders," rather than as "patients." And in formulating the topic as one for which the newcomer might be competent in common with them (rather than as one for which he is not, as is done by a next speaker who extends the utterance by saying ". . . discussing the psychological motives for . . ."), a possible invitation is done.

What this (here highly oversimplified) analysis provides, then, is not necessary and sufficient conditions for the felicitous performance of an invitation, or rules for its performance, but rather a partial method (Sacks refers to it as a "a partial definition") for doing an invitation in a particular interactional/sequential context.

IV

As noted, the earliest lectures, of 1964–5, include a variety of efforts to develop analyses along these lines. Certain themes recur, only some of which can be remarked on here, to highlight something of an abbreviated catalogue of concerns animating Sacks' work at the time.

Consider, for example, the following sort of issue to which Sacks addresses himself recurrently throughout the 1964–5 lectures (this is not an exhaustive listing):

How to get someone's name without asking for it (give yours), lecture 1.

How to avoid giving your name without refusing to give it (initiate repair), lecture 1.

How to avoid giving help without refusing it (treat the circumstance as a joke), lecture 2.

How to get an account without asking for it (offer some member of a class and get a correction), lecture 3.

How to get people to show they care about you, given few opportunities afforded by routine life, e.g., of the divorced (commit/attempt suicide), lecture 5.

How to introduce a piece of information and test its acceptability without saying it, lecture 6.

How to do a 'safe' compliment, i.e., without derogating others, lecture 8.

How to get help for suicidalness without requesting it (ask 'how does this organization work?'), lecture 10.

How to talk in a therapy session without revealing yourself (joke), lecture 12.

Sacks' analytic strategy here is not a search for recipes, or rules, or definitions of types of actions. He begins by taking note of an interactional effect actually achieved in a singular, real episode of interaction (in the listing above, this often includes an achieved absence – something which did not happen). And he asks, was this outcome accomplished methodically. Can we describe it as the product of a method of conduct, a *situated* method of conduct, such that we can find other exercises or enactments of that method or practice, in that situation or context or in others, which will yield the accomplishment, the recognizable accomplishment (recognizable both to co-participants and to professional analysts) of the same outcome – the same recognizable action or activity or effect.

So in the listing I have offered above, the 'solutions' mentioned in parentheses after some of the 'problems' are not 'general;' they are not practices which whenever or wherever enacted will yield those activities as systematic products. They are situated, contexted. How to describe the relevant contexts, the scope within which the proposed practice 'works'? That, of course, is one of the prime sets of problems in this analytic enterprise. How shall we as analysts describe the terms in which participants analyze and understand, from moment to moment, the contexted character of their lives, their current and prospective circumstances, the present moment – how to do this when the very terms of that understanding can be transformed by a next bit of conduct by one of the participants (for example, a next action can recast what has preceded as 'having been leading up to this'). Clearly enough, these questions are of a radically different character than those which are brought to prominence in an undertaking like that of Searle, or Austin (1962) before him.

The recurrent theme documented above will remind some readers of 'indirect speech acts.' In many items on that list the problem appears to be how to achieve some result without doing it 'directly' (as one says in the

vernacular – and it *is* a vernacular term). The proposed 'solutions' might then
be cast, in this vernacular and quasi-technical, idiom, as 'indirect' speech acts,
although this is, of course, an idiom not employed within the conversation-
analytic tradition. (cf. Levinson, 1983: 356–64 for one account).

One line of inquiry (ibid., 274; Brown and Levinson, 1978; Lakoff, 1973)
relates the use of indirect speech acts to considerations of politeness. But
Sacks' discussion focusses instead on what might be termed 'strategic/
sequential' considerations. He notes that the sorts of next turns made relevant
by what might be called direct requests are quite different from the ones made
relevant by the conduct whose methodic practices he is explicating. When
answerers of the telephone at a psychiatric emergency service ask "What is
your name?" they may get in return a request for an account – "Why?" – and
may end up not getting the name. When they give their own names, they do
not get asked "Why?," because they have not done an action which is
accountable in that way. The thrust of the analysis is, then, not considerations
of politeness, but contingent courses of action as progressively and differen-
tially realized in the set of turns that make up structured sequences based on
what would later come to be called 'adjacency pairs.'[21]

The divergence of these two paths of analysis seems quite clearly related to
the materials being addressed. On the one hand, we have single classes of
utterances, and eventually (Searle, 1976) not even particular ones necessarily,
but the categorical type of action which they are supposed to instantiate,
singly and across contexts. On the other hand, we have particular utterances
occurring in particular series of utterances, in particular organizational,
interactional and sequential contexts, with the source of the utterance in prior
talk and conduct accessible and demonstrably relevant to professional/
academic analysis as it was to the participants *in situ* and *in vivo*, and with the
ensuing interactional trajectory which was engendered by the utterance
inviting examination in the light of the set of possibilities from which it might
have been selected. One of these sets of materials is the natural setting for the
work of philosphy and 'academic' inquiry; the other is rather closer to the
natural setting for the workings of talk in the everyday world. Sacks' first
lectures make clear what course is being set.

The consequentiality of working with *particular* data, for example, with
particular utterances, is underscored elsewhere in these and subsequent
lectures, when Sacks directs the problematic of describing a 'method for the
production of . . .' to whatever action label one would assign to an utterance
such as "I'm nothing." Sacks asks (lecture 9, p. 67): how does someone
"properly and reproducibly" come to say such a thing, *this* thing? What is
someone doing by saying this thing, and how do they come to be doing it?

At the time that Sacks was launching inquiry along these lines, a common
reaction was that an utterance of this sort was 'just a manner of speaking.'

---

[21] Sacks deals with these themes from a different stance subsequently in Winter,
1967, cf. the lecture for March 9 in particular, and the discussion of the varying tacks
he takes below at pp. l–li of this introduction.

That the *particular* way of speaking, the phrasing, was almost accidental (a stance suitable to the view that an utterance is an enactment of a sentence which expresses a proposition, where it is the underlying proposition – perhaps accompanied by its 'function indicating device' – which finally matters, not the particulars which happen to give it expression on any given occasion). But Sacks saw it as the outcome of a procedure, as announcing 'a finding' by its speaker. He asked what that procedure was, and how it could arrive at such a finding, in a fashion that other participants would find understandable, and even 'correct.' He took seriously the particular form in which conduct appeared – the participants had said *this thing, in this way,* and not in some other way. He insisted on the possibility that that mattered – that every particular might matter. None could be dismissed *a priori* as *merely* (a word he particularly treated with suspicion) a way of talking.

Of course, the fullest version of this sort of analytic undertaking was Sacks' paper 'An initial investigation . . .' (1972a), where the utterance/action in question was 'I have no one to turn to." This utterance was also seen as reporting the result of a search, the description of which required developing the terms in which such a search might be understood to have been conducted, namely, 'membership categorization devices.' Early versions of parts of that paper (as well as other papers) can be found in the 1964–5 lectures, for example in lecture 6.

This way of working, then, mixed a kind of naturalism (in its insistence on noticing and crediting the potential seriousness of particulars of the natural occurrences of conduct) with the ethnomethodological concern for the Members' methods for the production of a mundane world and commonsense understandings of it. Sacks asked how the recognizably detailed ordinary world of activities gets produced, and produced recognizably. It was just this way of proceeding – describing procedurally the production of courses of action – that Sacks understood at the time to be the foundation of the sciences as 'science,' and therefore the grounds for optimism about the principled possibility of a natural observational discipline in sociology. A brief account of this view (argued in the 'Introduction' by Sacks, Appendix I in this volume) is in order.

V

Sacks had developed an argument[22] addressed to the question of whether

---

[22] The argument was written up, probably in the summer or autumn of 1965, after Sacks' first academic year of lectures, as a possible introduction to a contemplated volume entitled *The Search for Help*. This publication, which was never pursued, would have included two papers – 'The search for help: no one to turn to' (later published in Sudnow, 1972b), and 'The search for help: the diagnosis of depression,' never published. That the argument informed his thinking earlier, and entered into the first lectures, can be seen in the excerpt from lecture 1 cited at pp. xxv–xxvi above, and remarked on in n. 19.

sociology could be shown to be a possibly 'stable' natural observational discipline. By this question Sacks meant to address the possibility that social science provided merely stopgap accounts of human action, conduct, behavior, organization, etc., until such disciplines as biology and neurophysiology matured to the point at which they could deal with such problems. (This was a position that Sacks was trying out when I first met him in 1961–2, and could be seen as a kind of riposte to Chomsky's critique of Skinner. I always suspected that Sacks entertained the position as a provocation, in a law school pedagogical way, rather than as seriously tenable, but used it to force a consideration of the arguments necessary to set it aside. The position certainly shook me up when Sacks first confronted me with it in the winter and spring of 1962, for, in common with most sociology graduate students, I had treated such claims as long since undermined by Durkheim and other ancestors.) If sociology, or social science, were such a stopgap and thus 'unstable,' it hardly seemed worth investing much time and commitment in it. So before setting off on a serious research undertaking, it seemed in point to establish that a stable discipline was possible. Sacks believed that the argument he developed had a further pay-off; it showed something of the features the research enterprise and its results should have if it were to be, or contribute to, a stable science. The argument, briefly stated, was this.

Contributions to science, including to sciences such as biology and neurophysiology, are composed of two essential parts. One is the account of the findings. The other is the account of the scientists' actions by which the findings were obtained. What discriminates science from other epistemic undertakings is the claim that its findings are reproducible, and that reproducibility is itself grounded in the claim that the results were arrived at by courses of action reproducible by anyone in principle. Other investigators can, by engaging in the same actions, arrive at the same findings.

Sacks argued that both of these parts of contributions to science are 'science', and not just the findings. For it is the reproduction of the actions reproducing the results which make the findings 'scientific', and the descriptions of those courses of action which make their reproducibility possible. If the results are scientific, the descriptions of the actions for producing them must also be science.

But, he noted, the descriptions of courses of action in scientific papers are not couched in neurophysiological terms, but take the form of accounts of methods or procedures. This form of account of action is reproducible, both in action and in description.

So, Sacks concluded, from the fact of the existence of natural science there is evidence that it is possible to have (1) accounts of human courses of action, (2) which are not neurophysiological, biological, etc., (3) which are reproducible and hence scientifically adequate, (4) the latter two features amounting to the finding that they may be stable, and (5) a way (perhaps *the* way) to have such stable accounts of human behavior is by producing accounts of the methods and procedures for producing it. The grounding for the possibility of a stable social-scientific account of human behavior of a

non-reductionist sort was at least as deep as the grounding of the natural sciences. Perhaps that is deep enough.

This conclusion converges, of course, with the thrust of ethnomethodology as Garfinkel had been developing it, and was undoubtedly motivated, at least in part, by Sacks' engagement with Garfinkel (and informed, perhaps, by Felix Kaufmann (1944) as well). Still, the argument is novel and provides a grounding from a different direction than Garfinkel had provided. For the tenor at least of Garfinkel's arguments was anti-positivist and 'anti-scientific' in impulse, whereas Sacks sought to ground the undertaking in which he was engaging in the very fact of the existence of science. (And, indeed, in the earlier 'Sociological description' (Sacks, 1963) he had written, "I take it that at least some sociologists seek to make a science of the discipline; this is a concern I share, and it is only from the perspective of such a concern that the ensuing discussion seems appropriate.")

VI

I have remarked on two types of problems taken up in the 1964–5 lectures – the reproducible methods by which 'findings' such as "I'm nothing" or "I have no one to turn to" may be arrived at (note in this regard the special claim on Sacks' attention exerted by commonsense uses of 'quantifiers,' starting with the ones mentioned above, but extending to utterances such as 'Everyone has to lie', (Sacks, 1975)), and how to achieve some outcome without aiming for it 'directly'. Several other recurrent themes in these earliest lectures might be mentioned here.

One is an attention to certain 'generic forms' of statement or question, into which particular values can be plugged in particular circumstances. Sacks isolates, for example, the question form 'Why do you want to do X?' (lecture 5, p. 33), or the generic form of statement 'Because A did X, B did Y' (lecture 5, p. 36). Later he focusses on the form, 'X told me to call/do Y' (lecture 10, pp. 76–7). It was very likely the exposure almost exclusively to calls to the Suicide Prevention Center, and the sort of recurrencies which they provided, which led to a focus on regularities so literally formulated. But it was in this sort of problem that the concern with the formats of utterances, often rather more abstractly and formally described, initially appeared.

There is throughout these lectures the repeated use of 'the socialization problem' as a resource for focussing analysis. The question gets posed, 'How does a child learn that X?,' for example, that activities are observable; what properties of competence does socialization have to produce, and how are they produced; how does this learning take place (e.g., lecture 14, pp. 120–1). This form of problem or observation finds expression in Sacks' writing of this period as well as in the lectures (for example, in the remarks in 'An initial investigation. . . .' concerning what is involved in learning how adequate reference is to be done), although it recedes in prominence in the later years of the lectures.

These early lectures of 1964–5 touch on, or give a first formulation of, a variety of themes more fully developed in later work, either of Sacks' or by others.

For example, although many believe that the early lectures were taken up with membership categorization, and that sequential organization is only addressed in later years, we have already seen that the early lectures – including the very first – engage that issue from the very beginning. To cite but one other instance of this early engagement, lecture 9 includes observations on sequence organization (the asker of a question gets the right to do more talk), on what were later (Sacks et al., 1974) called contrasting speech exchange systems (remarks on press conferences and cross-examination), on how the turn-taking systems of different speech exchange systems can affect the forms of utterances (e.g., long questions when there is no right of follow up), and the like.

Or note how the earlier-mentioned recurrent theme concerned with 'how to do X without doing Y' finds later resonance not only in Sacks' work but in work such as that by Pomerantz (1980) on 'telling my side as a fishing device' (how to elicit information without asking for it), by Jefferson (1983) on 'embedded correction' (how to induce adoption of a correct form without correcting the wrong one), and others.

Or consider the material in lecture 11 concerned with glancing, looking, and seeing. The parts of this discussion which concerned the categories in terms of which one sees, anticipate the later discussion of 'viewer's maxims' in the lectures on "The baby cried" (lectures 1 and 2 for Spring, 1966, eventually published as 'On the analyzability of stories by children,' 1972b). They display as well Sacks' reflections on what such glance exchanges reveal about 'norms' in the more conventional sociological and anthropological sense, about 'social integration,' 'alienation,' and the like. And perhaps there is here as well a point of departure for Sudnow's later (1972a) work on glances, for example in Sacks' observation (p. 86) that "We start out with the fact that glances are actions."

It is worth noting that in some cases, discussions in these early lectures include points that are not found in later elaborations. Some of these seem to me to have been simply wrong – for example, the claim (lecture 5, p. 33) that 'opinion' is something you don't need a defense for. Others encountered problematic evidence within the conversation – analytic tradition of work. For example, Sacks had proposed that a method for doing greetings consisted in the use of one of the class of greeting terms in 'first position.' Schegloff (1967) disputes the generality of the claim by examining telephone conversation in which "Hello" in first turn is ordinarily *not* a greeting, and shows that claims in this domain of work can be addressed with data, investigated empirically and found to be the case or not.

Still other portions of these early lectures, however, appear to be strong points which simply dropped out of later reworkings of the topic. For example, lecture 6 is a version of (or draws on) 'An initial investigation . . . ,' 'On the analyzability . . .' 'Everyone has to lie,' and a paper which Sacks

never published, entitled 'A device basic to social interaction,' concerned with the character of the categories which compose membership categorization devices as organizing devices for commonsense knowledge about members. But Sacks makes a point in this lecture which I do not believe ever appears in any of the other accounts of these domains, concerning the relativity of category collections such as age and class to the categorizer; he notes that the recipient of some utterance which includes some such categories (such as 'young man') has to categorize the categorizer to know how they would categorize the one who had been categorized in the utterance.

These lectures, then, have more than merely historical interest as embryonic versions of later developed work. Some of the themes here, however insightful and innovative, happen not to have been further developed. And others, which were further developed, left behind some points which are still valuable and can be found here.

VII

As with the 1964–5 lectures, those for the Fall 1965 term include first tries at topics (both accounts of specific data episodes and analytical topics raised from them) taken up and elaborated in subsequent terms, as well as discussions which do not get such subsequent development. Among the latter are, for example, 'hotrodding as a test' (lecture 10) or 'non-translatable categories' (lecture 12). Among the former are "The baby cried . . ." and membership categorization devices (lectures 1 and 2) more fully elaborated as lectures 1 and 2 in the following term, Spring 1966; collaborative utterances addressed via "We were in an automobile discussion" in Spring 1966 (lectures 4 and 5); or 'tying rules' taken up in a number of subsequent lecture sets.

Still, there is good reason to read carefully the discussions of Fall 1965, even for topics which are given fuller, and apparently more satisfactory, treatment later. To cite but a single example, in the outline for the initial lecture on "The baby cried . . ." (here appearing as Appendix A for Fall 1965), at 1.a.2 and a.3, Sacks offers observations which do not appear in subsequent treatments of this material (either in Spring 1966, or in the subsequent publication as Sacks, 1972b) but which differentiate Sacks' point here from other, parallel claims – often characterized as being concerned with the order of narrativity. Others (often more or less contemporaneously, e.g., Labov and Waletsky, 1966) have remarked that in narratives the 'default' organization is that order of sentences is isomorphic with the order of the occurrences which they report. And in later versions of this analysis Sacks seems to be making the same argument. As it is put in the published version (1972b: 330), "I take it we hear that as S[entence] 2 follows S[entence] 1, so O[ccurrence] 2 follows O[ccurrence] 1." But here, in the Fall 1965 outline, he notes that "this cannot be accounted for simply by the fact that S1 precedes S2," for "we can find elsewhere two sentences linked as these are, with

nothing between, where we would not hear such an action sequence." And he offers an instance from the same collection of children's stories, ". . . . The piggie got hit by the choo-choo. He got a little hurt. He broke his neck. He broke his chin."

The point is that what is at work here is more than a matter of narrative technique or of discourse organization, although these may well be involved. Rather 'commonsense knowledge' of the world, of the culture, and of normative courses of action enter centrally into discriminating those actions or events whose description in successive sentences is to be understood as temporal succession from those which are not. It is not, then, a merely formal or discursive skill, but can turn on the particulars of what is being reported. This theme drops out of later discussions of these materials.[23]

If this point seems to resonate basic themes of so-called contextualist, or social constructionist or ethnomethodological stances, there are other elements in these early lectures which operate on a different wavelength. For example, early in the development of what he called 'tying rules' (in which he is addressing matters later often discussed under the rubric of 'cohesion,' cf., for example, Halliday and Hasan, 1976) he proposes (Fall 1965, lecture 5, p. 159) to be

> taking small parts of a thing and building out from them, because small parts can be identified and worked on without regard to the larger thing they're part of. And they can work in a variety of larger parts than the one they happen to be working in. I don't do that just as a matter of simplicity . . . the image I have is of this machinery, where you would have some standardized gadget that you can stick in here and there and that can work in a variety of different machines . . . So these smaller components are first to be identified because they are components perhaps for lots of other tasks than the ones they're used in.

Thus, there is room within a larger, contextually sensitive, address to his materials (cf. the earlier-discussed contrast of Sacks' starting point with that of Searle) for the recognition and more formal description of particular practices and sets of practices – here metaphorized as 'gadgets' or 'machinery' – which members can use in constituting coherent talk and specific lines of action and interaction, and for an appreciation that some of these may operate in a way substantially unqualified by the particulars of local context.

Recall again (cf. the discussion above at pp. xx-xxii) the echoes in Sacks' work in this period of some of the themes of work in generative grammar (more accurately, an analytic model whose most lively embodiment at the time was generative grammar, but which is surely not limited to that domain of work).[24] The lectures for Fall 1965 were for a course whose catalogue title

---

[23] It does not drop out as a theme of the lectures, however; cf. the discussion at pp. xxxvii–xxxviii below, and n. 26.

[24] It is worth making explicit here that Sacks kept himself informed of

was 'Culture and personality.' Whether or not he would otherwise have been inclined to do so, it was perhaps this title which prompted some discussion by Sacks of the notion 'culture.' In setting out the orientation of his examination of the story told by a child, "The baby cried, the mommy picked it up," Sacks subsumed it, and the 'machinery' by which it was produced and heard, under the notion 'culture,' of which he remarked, "A culture is an apparatus for generating *recognizable* actions; if the same procedures are used for generating as for detecting, that is perhaps as simple a solution to the problem of recognizability as is formulatable' (Fall 1965, Appendix A, p. 226, emphasis in original.)[25] His description of what 'the apparatus' should do is strikingly reminiscent of lines from early Chomsky, and seems directly targetted at transformational grammar, but here, surprisingly, not at its principles – but at its product: 'We are going to aim at building an apparatus which involves building constraints on what an adequate grammar will do, such that what an adequate grammar will do, some of the things it will do, we are going to rule out, and provide for the non-occurrence of' (Fall 1965, Appendix A, p. 229). Sacks' undertaking here seems in important ways to be shaped by the transformational grammar enterprise, albeit in a corrective stance toward it. The stance seems to be something like the following. Given an undertaking like the one generative grammar studies had seemed to set in motion, and operating with similar sorts of goals (e.g., to generate all and only the grammatical/acceptable sentences of a language), getting right results requires looking at something other than just the linguistic or, even more narrowly, the grammatical aspects of sentences or utterances. Not language, but culture, is the key object and resource. And while such an enterprise was understood by some 'as ethnomethodology,' by others it was seen as an anthropological/cultural version of cognitive science (albeit along different

---

contemporary developments in a wide range of potentially relevant disciplines, and was aware of what seemed to be 'hot' topics and ways of working. His work recurrently speaks to such developments, sometimes explicitly, sometimes tacitly. He is aware of, and responsive to, his intellectual ambience. The present account often underscores such points of convergence and contrast – both with respect to the ambience at the time Sacks' work was being done and with respect to developments at the time the present publication is being prepared. What may be of enduring interest is the larger picture of the intellectual stances and developments at issue, rather than the more transient excitements that pass over areas in ferment, even if these substantially engage a generation of workers in a field.

[25] On some readings, it is telling to compare this stance with Garfinkel's account of ethnomethodology (1967: 1), about whose studies he writes,

Their central recommendation is that the activities whereby members produce and manage settings of organized everyday affairs are identical with members' procedures for making those settings 'account-able' . . . When I speak of accountable my interests are directed to such matters as the following. I mean observable-and-reportable, i.e., available to members as situated practices of looking-and-telling.

lines than those previously suggested by studies in ethnoscience and compo-
nential analysis).

There are various problem-types addressed and observations developed in
these lectures which seem to have a (sociological?) bearing on what came to
be called 'cognitive science.' Here I can mention only one of each.

First, observations. Both in Fall 1965 (lecture 7) and in Spring 1966
(lecture 18) Sacks comments on the differential 'owning' or control of certain
categories by different social groups, and the not uncommon asymmetry
between those to whom a category is applied and those who apply it. One
particular focus for this line of analysis is the pair of terms 'adolescent' and
'hotrodder' as applied to teenaged boys. 'Adolescent' is 'owned' by the
conventional adult society, and is deployed by its members (together with all
the commonsense knowledge or 'conventional wisdom' for which it is the
organizational locus in the culture) more or less without regard to the views
of those whom it is used to characterize. 'Hotrodder' (or, more recently,
'punker,' etc.), on the other hand, are categories deployed by their incum-
bents, and in ways often inaccessible to those who are not themselves
members. It is this relative independence from the 'official' or conventional
culture that led Sacks to term such categories 'revolutionary' (Spring 1966
lecture 18, and Sacks, 1979). There seems to be here a whole area of inquiry
which might be termed a sociology of cognition or a cognitive sociology quite
distinct from other usages of this term (cf. especially Cicourel, 1974). Insofar
as it involves the differential relevance of different category sets for the
cognitive operations of persons dealing with categories of persons, its
relevance to cognitive science seems transparent.

Second, problem-types. There is a form of problem which Sacks takes up
a number of times in the early lectures, each time on a distinct target, which
can be best characterized as an 'analysis of the ordering of cognitive
operations' (or the ordering of interpretive procedures). Two especially
brilliant instances of solutions to this problem-type occur in the Spring 1966
lectures. In lecture 11 (pp. 350–1) and again in lecture 21 (pp. 417–20), in
dealing with an instance of 'intentional misaddress,' Sacks wonders how the
co-participants in an interactional episode could have found who was being
addressed, since the address term employed by the speaker ("mommy") did
not 'actually' apply to anyone present. He argues that, if they were finding
'who is being addressed' by finding to whom the address term referred, then
they would find no solution. Rather, he argues, they first use sequencing rules
to find whom the current speaker would properly be addressing, and they use
the product of that analysis in deciding how the address term is properly to
be interpreted. He is thus able to sort out the order in which these analyses are
conducted – first addressee, then address term – and it turns out to be just the
opposite from what one might have thought.

Another instance of the same problem is addressed in lecture 16 for Spring
1966. Here the object of interest is what is conventionally known as 'the
possessive pronoun.' Rather than taking a word like 'my' as indicating a
relationship of 'possessing' toward whatever it is affiliated to (which yields

results in usages such as 'my brother' or 'my teacher' which are either obviously faulty or in need of subsequent, and questionable, interpretation), Sacks argues that a hearer/receiver must first determine that what 'my' is attached to is a 'possessable' – the sort of thing which in that culture can be possessed (rather than a category from a membership categorization device, for example), in order to decide that 'my' is being used to claim possession. Once again, an ordering of analyses – of cognitive operations – seems clearly involved.

In both of these cases, the upshot of Sacks' analysis is to reject as inadequate the view that linguistic items determine the meaning or the force of an action, and to insist instead that the cultural, sequential or interactional status of the objects employed in the utterance shape the interpretation of the linguistic item.[26]

But for Sacks there was no in-principle ordering of what sorts of things one consults first (e.g., the syntactic, semantic, sequential, interactional, etc.) and no necessary priority, therefore, among the disciplines which study them. Perhaps the first appearance of this problem-type is in lecture 4 for Fall 1965. Here Sacks is discussing various forms of 'tying rules,' forms of talk (such as indexical or anaphoric reference) which require a hearer to make reference to another utterance to understand a current utterance, and which thus 'tie' the utterances to one another. Encountering such usages of 'that' as "I decided that years ago" or "That's the challenge," Sacks remarks that they present a complication relative to other instances of tying procedures which he had previously discussed, for such usages must be distinguished from the use of 'that' in, for example, "I still say though that if you take . . . " Before analyzing a 'that' for the sequential tying connection it makes to some other (ordinarily prior) utterance, a hearer has to do a syntactic analysis to determine that the 'that' is the sort which can tie back to some earlier component of the talk. Here, once again, the sheer occurrence of an item (whether address term, 'my,' or 'that') does not determine what is to be made of it. But whereas in the analyses previously discussed a linguistic analysis is contingent on prior sequential, interactional or cultural analyses. here the sequential 'tying' analysis is contingent on a prior syntactic one.[27]

---

[26] Related discussions can be found throughout the lectures. For example, in the Spring 1966 lectures: lecture 11, pp. 350–1 (re how sequential and interactional organization controls the semantic and truth-conditional interpretation of an utterance, rather than the opposite, which is the ordinary understanding); lecture 16, p. 383; lecture 21, pp. 417–20; lecture 27, p. 451 (where sequential context is shown to control the very hearing of a word); and lecture 29, pp. 461–3. See also the earlier discussion at n. 23. Fuller discussion of the theme and the particular analyses on which it rests must await another occasion.

[27] Still, there is little doubt that the main thrust of analyses along these lines is that the understanding of talk is, in the first instance, controlled by the hearer's grasp of the sequence in progress (or the sequential context more generally), rather than being derived from the linguistic tokens. Cf., for example, the discussion in Spring 1966, lecture 27, p. 451, where Sacks discusses the difficulty experienced by one participant

Whatever the particulars, both these observations about control of categorization structures and deployments and the problem-type addressed to the ordering of cognitive or psycholinguistic or interpretive operations are theoretically central to the responsibilities of a sociological, or more generally interactional, sector of what are now called the cognitive sciences. And to the degree that the results of these inquiries inform and constrain our understanding of how linguistic and category terms work, indeed *can* work, their import goes well beyond the interactional domain which is their initial locus.

The quasi-generativist themes in the Fall 1965 lectures, and in the 1964–5 lectures as well, co-exist with analyses of particular action types ('how to do action X') based on empirical materials of talk, and co-exist as well with analyses of sequencing and tying practices – also developed on empirical materials, and addressed to the doing of conversation as an undertaking in its own right. This variety of topics and approaches (and I have not mentioned all the separate strands here) are, then, not a matter of stages in Sacks' intellectual development over time. There are in these early lectures different sorts of undertaking underway, differentially developed by Sacks, differentially appealing to various segments of his professional readership, and perhaps differentially susceptable to development by others, and, therefore, differentially institutionalizable as a discipline. Surely, however, the drift of his own subsequent work favored some of these initiatives over others.

VIII

If the lectures of Fall 1965 tilt in the direction of culture (whether incidentally because of the course title or because it was central to Sacks' preoccupations at the time), the Spring 1966 lectures feature culture quite centrally. This was the most extensively taped and transcribed of the lecture sets, and it is as rich as anything in the materials assembled in these volumes. In its range – from the empirical detail of the interactional materials to discussions of some of the classic texts of social science and western culture – it gives the reader some sense of the power of the mind at work here, of the nuanced sensitivity to detail and of the scope of learning being brought to bear, and the distinctive stance being developed through the conjunction of these resources. Here I can touch only briefly on a few of the central themes of these lectures.

One theme, clearly part of the 'culturalist' motif of these lectures, and surely not unrelated to the abiding preoccupation with 'reflexivity' and the 'incarnate character of accounts' central to the continuing development of ethnomethodology in Garfinkel's oeuvre, concerns the relationship between

---

in hearing something addressed to him which is acoustically accessible to everyone else. He remarks that the party in question hears that turn by reference to the sequence in which it occurs 'so as to hear, indeed, a puzzle, when he could hear something perfectly clear.'

'commonsense knowledge' and real world conduct or praxis on the one hand, and between commonsense knowledge and 'professional' inquiry on the other hand. This theme provides an opportunity as well to touch on the elements of continuity and discontinuity in the orientation of Sacks' work going back to 'Sociological description' (1963).

   Although there is no direct connection between the positions explored in 'Sociological description' and these lectures, there are echoes here, formal similarities to aspects of the earlier paper. By 'no direct connection,' I intend two observations. First, there is a substantial difference between what Sacks is doing in the lectures and the hypothesized program of studies which Sacks entertained in 'Sociological description' as a contrast with his depiction of how contemporary sociological inquiries are conceived and carried through. Second, there was no direct step-by-step theoretical development that led from the position taken up in the 1963 paper to the directions pursued in the lectures of 1964–6. On the other hand, I can only roughly suggest one sort of observation I have in mind in suggesting 'echoes' and 'formal similarities.'

   The central metaphor of 'Sociological description' was the so-called 'commentator machine,' a 'device' describable (from one point of view) as composed of two parts – one which engages in some physical activity and another which produces a form of language, understandable as a description of what the first part is doing. Sacks entertains a variety of possible formulations of this device, and the 'proper' understanding of the relationship of its parts. The 'doing part' can be understood as a resource for coming to understand what the 'speaking part' is saying. The 'speaking part' can be understood as a description of what the 'doing part' is doing. The contraption may be understood as two independent devices. And so on. For those views in which the two parts do relate to one another, 'discrepancies' between the parts can be variously understood: for example, as the 'speaking part' offering *inadequate descriptions* of the 'doing part;' alternatively, as the 'doing part' malfunctioning and *badly enacting* the program set forth by the 'speaking part.'

   With such a theme in the background consider just a few elements of the first two lectures of Spring 1966 and some elements from the lectures of the intervening year, 1964–5.

   One of the central tasks which Sacks sets himself in the lectures on "The baby cried" is providing an account of how recognizable activities are done, and done recognizably. And in particular how the activity of 'describing' is done, and done recognizably. The key starting point here is that descriptions *are* recognizable, *are* recognizable descriptions, and are recognizable descriptions without juxtaposition to their putative objects. Much of Sacks' effort in the early years of this analytic enterprise was given over to building an apparatus that provided recognizable descriptions without reference (by real life co-participants or by professional investigators) to what was putatively being described. The 'membership categorization devices' introduced in lectures 1 and 2 of Spring 1966, and the MIR device introduced in lecture

6 of the 1964–5 lectures (p. 41)[28] are key elements in such an apparatus. And the commonsense knowledge of the social world which is organized in terms of these categories, 'protected' as it is 'against induction' (as Sacks used to remark), provides for just such autonomously recognizable possible descriptions. When some potential discrepancy is suggested between what is provided for by the 'knowledge' organized around some category in a categorization device and what is observably the case about some putative incumbent of such a category, what may well be found (Sacks pointed out, and this is part of what he meant by 'protected against induction') is not the inadequacy of that 'knowledge' but rather the inadequacy of that person as a member of the category involved, an inadequacy which that person may feel and may seek to remedy.

Although vastly transformed (from a 'doing part' and 'speaking part' to 'observable conduct' and 'recognizable description'), the problematics concerning (1) the proper juxtaposition of the practical activities of social conduct, (2) the commonsense knowledge of the mundane world and descriptive practices resident in that world, and (3) the proper formulation of investigators' stances and goals with respect to that world, persist from 'Sociological description' through these lectures.

One component of these problematics is specially important throughout these lectures, surfacing at the end in Spring 1966, lecture 33 but also central at the beginning, and that is the relationship between commonsense knowledge which investigators may share with those whose conduct is the object of inquiry and the proper formulation of research questions, observations and findings. Sacks begins the discussion of "The baby cried" with a number of observations which he makes about the components of this little story, and offers the claim that his audience would have made (perhaps did in fact make) the same observations. But these are not sociological findings, he insists. They are simply the explication of commonsense or vernacular knowledge. Rather than constituting analysis, they serve to pose a research problem, namely, the construction of an apparatus that would generate (or that has generated) such observations, that would (in that sense) have produced them. And such an apparatus would constitute findings.

Both parts of this analytic operation are important: making explicit the understandings which common sense provides of the world which members of the society encounter, including the conduct of others; and the provision of something that can account for those understandings. And it is important to keep them distinct and to insist on both.

Consider, for example, the notion of category-bound activities. It is in order to address the observation that a report of 'crying' makes the category 'baby' (in the sense of a 'stage-of-life' category) relevant that Sacks introduces this notion, and the proposal that the activity 'crying' is 'bound' to the

---

[28] Sacks (ibid.) explains the term 'MIR device' by saying, "that is an acronym. 'M' stands for membership, 'I' stands for inference-rich, and 'R' stands for representative."

membership category 'baby' as one of the 'stage-of-life' categories in particular. But the observation that "crying is bound to 'baby'" is (like the initial observations in the lecture) not a finding; it is merely the claimed explication of a bit of commonsense knowledge. As such it is just a claim, and cannot be simply asserted on the analyst's authority. It has to be warranted somehow, either by a test of it or by requiring it to yield some further pay-off to analysis.

And this is what Sacks does with "crying being category-bound to baby." He immediately (lecture 1, p. 241) constructs a test of this category-boundedness, even though (as he says) "it's obvious enough to you, you wouldn't argue with the issue." The pay-off, it will be recalled (lecture 1, ibid), is not only the explication of 'praising/denigrating' as a test for the category-boundedness of the action 'crying,' but an account for how to do such recognizable actions as 'praising' or 'deprecating', research goals already familiar from the 1964–5 lectures and from elsewhere in the Spring 1966 opening lectures.

This stance is a basic and persistent one in these lectures. Elsewhere, for example, Sacks insists on testing the claim that the categorization device 'therapist/patient' is 'omni-relevant' in the group therapy sessions which supply the data for most of these lectures (Spring 1966, lecture 6, p. 315; lecture 29, pp. 462–3; then again in Winter 1967, February 16, and Spring 1967, lecture 14), although this claim can be treated as no less 'obvious.' To be sure, when he has recently made the point, Sacks sometimes asserts a claimed category-bound activity without carrying through a test or deriving a further finding (e.g., lecture 4, p. 302), but there can be little doubt that the principle is basic – commonsense knowledge cannot properly be invoked as itself providing an account, rather than providing the elements of something to be accounted for.[29] In my view, Sacks abandoned the use of 'category-bound activities' because of an incipient 'promiscuous' use of them, i.e., an unelaborated invocation of some vernacularly based assertion (i.e., that some activity was bound to some category) as an element of an account on the investigator's authority, without deriving from it any analytic pay-off other than the claimed account for the data which motivated its introduction in the first place.

The editorial effort to combine and blend largely overlapping treatments of the same material, which has prompted the inclusion of lectures delivered during the following term in Fall 1966, here in the Spring 1966 set (e.g., lecture 04.a), brings into relief certain shifts in analytic focus which accompanied a return by Sacks to the same empirical materials. Only two of

---

[29] See, for example, lecture 04.b, p. 295, here included with the Spring 1966 lectures, though actually delivered later, in Fall 1966: '. . . it is our business to *analyze* how it is that something gets done, or how something is 'a something,' and not to *employ* it.'

This theme – as represented, for example, in the phrase introduced by Garfinkel, 'commonsense knowledge as topic and resource' – is, of course, central to ethnomethodology.

these shifts can be taken up here, and only for a brief mention.

As remarked earlier, the analytic task set front and center in the initial lectures for Spring 1966 was "how recognizable actions get done and get done recognizably." The first two lectures address those questions to the actions 'doing describing' and 'doing storytelling.' (The third lecture, omitted here because of its availability in a published version as 'Everyone has to lie' took up the issue of 'doing a recognizably true statement.') Lectures 04.a and 04.b, interpolated here from Fall 1966, have a different analytic focus – observing and establishing orderliness – but lectures 4, 5 and 6 (delivered in the Spring term) continue the 'recognizable actions' theme (doing recognizable invitation and rejection) and reproducible methods for accomplishing recognizable actions.

At the same time there is an apparent shift toward the invocation of a kind of evidence that was to assume an increasingly central place in Sacks' conception of how to ground an argument or an observation. In lecture 4 (from the Spring) he proposes that, in order to establish that "we were in an automobile discussion" is doing a recognizable invitation, it is necessary not only to agree that it "looks like an invitation" but to show "how that's so" (p. 301) with the description of a method for doing invitations that works for the instance at hand. This echoes the stance of lectures 1 and 2.

In lecture 04.a (pp. 286–7, 288–9) from the Fall 1966 term, Sacks offers as evidence that some earlier talk was attended by others than its overt interlocutors, and as evidence that it constituted a recognizable introduction, the *prima facie* evidence afforded by a subsequent speaker's talk. Specifically, he notes, that when Ken responds to the utterance of his name by the therapist Dan not with "What" (as in an answer to a summons), indeed not with an utterance to the therapist at all, but with a greeting to the newly arrived Jim, he shows himself (to the others there assembled as well as to us, analytic overhearers) to have attended and analyzed the earlier talk, to have understood that an introduction sequence was being launched, and to be prepared to participate by initiating a greeting exchange in the slot in which it is he who is being introduced.

There is a shift here in analytic stance and procedure, from the analyst's understanding as initial point of departure on the one hand to the co-participant's understanding as initial point of departure on the other.

In the former mode, the analysis begins with an asserted convergence of interpretations and recognitions by the analyst and the analyst's audience (for example, that something is a story, that 'the mommy' is 'the mommy of the baby,' that an utterance is doing an invitation, and so on). It proceeds by the provision of a methodical basis for both that convergence of understandings and the convergence between the 'understanders' and the producers of the to-be-understood 'in the data.' In the latter mode, analysis begins with an asserted observation (that not-overtly-engaged participants are attending, and, indeed, are obligated to attend to the talk), and then immediately grounds that observation in subsequent conduct by the co-participants in the episode being examined. That conduct is taken as displaying the product of

their orientation to, and understanding of, the setting and what has been transpiring in it. The site of analysis is located in the setting of the data at the outset. And further: the analysts' so treating the conduct of the participants is itself grounded in the claim that the co-participants so treat it.

This contrast in stance and procedure is visible in this publication of the lectures only briefly, by virtue of the juxtaposition of the material from Spring and Fall 1966. What is seen only in lecture 0.4a–b here is seen increasingly thereafter, starting with the Winter 1967 lectures in the present volumes. Of course, this shift does not entail any abandonment of the commitment to provide an account for how the recognizable outcome – whatever sort of object it may be – is produced, although the form such an account might take does change over time. The subsequently developed description of the turn-taking organization, for example, is offered as a procedural account for how a substantial collection of observable achievements of ordinary talk are methodically produced by the co-participants.

What I have referred to as the 'culturalist' tenor of the Spring 1966 lectures is set in the first of its lectures, when Sacks sums up his initial gloss of the understanding of "The baby cried . . ." as indicative of "the operation of the *culture*" as "something real and something finely powerful" (Lecture 1(R), pp. 245–6, emphasis supplied). The analysis of the membership categorization device and of the commonsense knowledge organized by reference to its categories is, in its fashion, an analysis of culture – "an analysis of *some* culture," as Sacks puts it (lecture 30, p. 469, emphasis supplied). Throughout these 34 lectures (cf. especially lectures 13, 16–21, 24–25 and 31 and the appended manuscript 'On some formal properties of children's games') may be found treatments of various forms and artifacts of 'culture' in at least that anthropological sense in which it refers to the categories through which 'reality' is grasped. Among these forms and artifacts are the categories of persons making up a society and its world and who is entitled authoritatively to 'administer' those categories (lecture 13), notions of possession and possessables, the constitution of observations and descriptions, measurements systems (lecture 24), games (lectures 13 and 31 and 'On some formal properties . . .'), conceptions of danger and their bearing on differentially accomplishing such actions as warning and challenge (lecture 10, 12) etc. A kind of socio-cultural semantics is involved, and a largely anthropological literature is invoked, reflecting Sacks' engagement with then-contemporary work in so-called 'ethnoscience.'[30]

[30] Cf. Sacks' contrast of his own way of working on such matters with the then-mainstream approaches to ethnoscience, for example, with regard to 'measurement systems,' the discussion at lecture 24, p. 436, where the contrast is almost certainly with the work of Berlin and Kay (1969, but circulated in mimeo earlier) on color terms.

Although ethnoscience is in point for this particular reference, Sacks' reading in, and use of, the anthropological literature was very broad indeed – both in 'areal' terms and in 'approaches.' What he most appreciated was some combination of dense and acutely observed ethnography, tempered by a sharp theoretical intelli-

All of these lectures provide rich materials for analysis and discussion, but in the present context, a brief consideration of Sacks' treatment of games may serve to recall some of the relevant intellectual context for this sort of cultural analysis, as well as to permit a brief consideration of a direction for the study of culture and acculturation, including language acquisition, which deserves fuller exploration than it has been accorded.

The most immediately relevant context for writing about games within American social science in the mid-1960's traces back to the invention of 'game theory' in 1944 by von Neumann and Morgenstern as a branch of mathematics with overtly 'social' applications (the title of their book was *Theory of Games and Economic Behavior*), with its subsequent elaboration by economists and others concerned with strategic thinking, most visibly in the late 1950's and early 1960's, in authors such as Kenneth Boulding (1963), and Thomas Schelling (1961). The analytic force of the metaphor propelled it into the arena of discourse and interaction as well, the language of constitutive rules playing a central role in Searle's development of speech act theory, for example, and strategic considerations entering psychology and sociology through varieties of 'exchange theory' (e.g., Thibaut and Kelley, 1959, or Blau, 1964). More proximately to Sacks' thinking, both Goffman and Garfinkel had explored the game model or metaphor in their own work – Goffman in his essay 'Fun in games' (in Goffman, 1961) and later in *Strategic Interaction* (1969, but written in 1966–7), and Garfinkel in the so-called 'trust' paper (Garfinkel, 1963), a paper from which he subsequently distanced himself, refusing to include it in the collection of his papers in 1967, *Studies in Ethnomethodology*.

One problem with the assimilation of game theory into social science was in establishing the limits of its usefulness as a model of social reality, a concern surely central to both Goffman's and Garfinkel's treatment of it. One central objection is that 'games' fail as a basic model of social order much as 'contract' failed as a basic model in Durkheim's discussion of 'utilitarian' social theory, an element of Durkheim (and Parsons' (1937) treatment of Durkheim) especially emphasized by Garfinkel. In both cases, the 'model' – whether 'contract' or 'game' – is itself 'an institution,' a normatively constrained organization of understandings and conduct, with its own constitutive infrastructure. 'Contract' could not undergird social order because, as a legal institution, it was itself undergirded by the social order it was invoked to explain. So also would 'games' fail as models of social interaction, for the

gence, and informed by broad learning. I recall especially his appreciation of Hocart and Elizabeth Colson, of Fortune and Edmund Leach, of Evans-Pritchard and Max Gluckman. But less reknowned ethnographers were no less appreciated. His fondness for ethnography crossed disciplinary boundaries, and he collected original issues of the volumes produced by the founding 'Chicago school' of sociological field workers – Nels Anderson, Paul Cressey, Franklin Frazier, Clifford Shaw, Frederic Thrasher, Harvey Zorbaugh – and later sociological ethnographies such as Dollard (1937), Drake and Cayton (1945), and, in a different vein, studies like Cressey (1953), discussed earlier.

conduct of games and their constitution presumed an infrastructure of interactional conduct, and an epistemic/ontological definition as a discrete order of 'reality,' within which games constituted a separate domain of activities. Such misgivings would surely have informed Sacks' approach to games from the outset.

It is noteworthy, in this regard, that Sacks focussed on *childrens'* games,[31] and that one of his central preoccupations was to get at that very infrastructure by reference to which games, as a special class of events, also are undergirded. Thus, both in lecture 13 (on the game 'Button-button who's got the button') and in the draft manuscript on children's games appended to the Spring 1966 lectures, games are treated not as models *of* or *about* social life *for* the social scientist, but as training grounds for formal aspects of social life *in* social life, i.e., as arenas within social life for kids' learning of central features of (the) culture, features such as the operation of membership categorization devices, the management of appearance and emotional display, etc. His treatment of children's games aims to provide analytic particulars for his claim ('On some formal properties . . . , Spring 1966, Appendix A, p. 502) that "Play then becomes an environment for learning and demonstrating criterial matters in real world action." Games provide models *of* social life *in* social life for its initiates, and in that capacity can be looked to for methodically central components of culture. In that regard, for example, such a game-relevant contrast as 'counting' versus 'not counting' can provide materials on which can be built such 'real-world' contrasts as 'legal versus illegal.'

Considerations of enculturation and 'language acquisition' provide an especially provocative focus for a matter which Sacks raises, in the first instance, rather more as a methodological point. Taking up the methodological relevance of sampling, Sacks points out that it depends on the sort of order one takes it that the social world exhibits. An alternative to the possibility that order manifests itself at an aggregate level and is statistical in character is what he terms the 'order at all points' view (lecture 33, p. 484). This view, rather like the 'holographic' model of information distribution, understands order not to be present only at aggregate levels and therefore subject to an overall differential distribution, but to be present in detail on a case by case, environment by environment basis. A culture is not then to be found only by aggregating all of its venues; it is substantially present in each of its venues.

Leaving aside the consequences for the methodology of professional inquiry, consider the implication that ' . . . any Member encountering from his infancy a very small portion of it, and a random portion in a way (the parents he happens to have, the experiences he happens to have, the vocabulary that happens to be thrown at him in whatever sentences he

---

[31] Recall that this antedates by several years organized attention to play and games in the social science community, as represented, for example, in the wide ranging collection edited by Bruner, Jolly and Sylva (1976).

happens to get) comes out in many ways pretty much like everybody else, and able to deal with pretty much anyone else' (ibid., p. 485).

In such a view, one might conjecture, we have one, and perhaps the major, theoretically available alternative to Chomsky's argument that, given the highly limited and 'degenerate' sample of a language to which first language learners are exposed, most of language – the crucial part – must certainly be innate; they surely could not be induced from the available 'inputs.'

The alternative is to consider a culture – and language as one component of culture – to be organized on the basis of 'order at all points.' If culture were built that way, then socialization and language acquisition might well be designed accordingly, and require induction from just the 'limited' environments to which the 'inductee' is exposed. As Sacks writes (ibid., p. 485), ". . . given that for a Member encountering a very limited environment, he has to be able to do that [i.e., grasp the order] . . . things are so arranged as to permit him to." 'Things' here presumably includes the organization of culture, the organization of language, the organization of learning, and the organization of interaction through which the learning is largely done. What such a view projects is the need for an account of culture and interaction – and the acquisition of culture and language *in* interaction – which would complement a 'cognitive' language acquisition device and innate grammar much reduced from contemporary understanding. Studies relevant to such a view have been pursued for the last two decades or so, but not necessarily under the auspices of the theoretical stance toward culture which Sacks projects here. The evidence for an 'order at all points' view has accrued throughout Sacks' subsequent work and the work of others working in this area.

IX

The sessions from Winter 1967 appear in various respects transitional. There are returns to, and revisions of, themes initially discussed in earlier sets, including 1964–5 lectures, and initial explorations of topics taken up in much greater detail in subsequent terms. The discussion here can only touch on a few of these themes.

It is in the session of March 2, 1967 that we find the first substantial consideration of turn-taking in multi-party settings. Here, as elsewhere in the lectures, a set of materials is treated lightly near the end of one term, and then is taken up in much greater detail in the next. The single session devoted to turn-taking in Winter 1967 is followed by seven lectures in Spring 1967 (the lectures on turn-taking from that term are not printed here), and an extensive run in Fall 1967.[32]

---

[32] Another 'take,' embodying a different stance toward the work, is presented in the Fall 1968 lectures.

A good deal of this treatment seems to have been prompted by reflections on the difference between the two-party talk discussed in the 1964–5 and Fall 1965 lectures on the one hand (for which the materials were drawn from telephone calls to the Suicide Prevention Center), and, on the other, the group therapy sessions (GTS) on which many subsequent lecture sets are based.

But the relevance of working with multi-person talk was not limited to the issue of turn-taking alone. To cite but one other product of the juxtaposition, the discussion at pp. 529–33 of the March 2 session is concerned with 'derivative actions,' i.e., what a speaker may be doing to a third party by virtue of addressing a recipient in a certain way. This seemed to Sacks but one indication of the need to take up multi-person materials apart from two-party ones (p. 533).[33]

There is a theme taken up in the February 16 session, and touched on again on March 9 (pp. 543–6), whose relevance to contemporary concerns (both then and now) may be worth brief development here. One way of characterizing those concerns is the generic relevance of context to talk in interaction.

The general question taken up is whether there is some way of formulating or invoking the sheer fact of the 'settinged'-ness of some activity, without formulating or specifying the setting. The 'solution' which Sacks points to is the use of indicator terms (e.g., 'here and now' or stable uses of 'this') to do this, a usage which affords us evidence that it can, in fact, be done. Indicator terms can be seen as a machinery for invoking an unformulated setting, for referring to (categorially-) unidentifed persons, or taking note of unformulated activities.

But where does this 'question' come from? Why is its solution of any interest? The beginning of the discussion, of course, is given not by a question, but by some observations which end up as the 'solution.' This was a common, and recommended, analytic procedure for Sacks: begin with some *observations*, then find the problem for which those observations could serve as (elements of) the solution.

The observations in point here concerned the use of such 'indicator terms,' terms whose special relevance for ethnomethodology had (under the name 'indexical expressions') already been developed and underscored by Garfinkel (1967, passim). And the central observations here had come up in a train of considerations with a quite different focus, along the following lines.

The discussion begins with the problems of the 'professional' analyst (i.e., the 'conversation analyst,' not the 'therapist' in the data) establishing the categorization device 'patient/therapist' as omni-relevant for the participants (which would cast it as always-invocable – 'on tap,' so to speak – both by participants and by analyst). One way of doing that analytic task is to establish a formulation of the setting as 'group therapy session' as omni-relevant. Sacks then observes that this is but one form of 'formulating as a

---

[33] Subsequently it turned out that derivative actions can be found in two-party conversation as well (Schegloff, 1984 [1976]).

Introduction xlixsuch-and-such,' and that this is something that *Members* do. When they do it, it is consequential, that is, they are doing some possible *action* in doing the formulation. (Recall the discussion in Spring, 1966 of "we were in an automobile discussion" as a formulation of the topic as a such-and-such which is consequential – which does a possible invitation.)

The question then is: is there some way of referring to the context, or components of the context, without *formulating* the context (or persons or actions in it) as such-and-such – without, therefore, potentially doing the actions which such a formulation might do. (Note that this can be a consideration both for members/participants-in-the-interaction and for professional analysts: for members so as to avoid doing the potential actions and the responses they would engender in the interactional setting; for analysts because it is precisely the escape from control by that interactional consequentiality, from what otherwise constrains or 'disciplines' formulations, that makes professional use of the lay device problematic).

It is in this context that the observation about the indicator terms finds its resonance: terms like 'here and now' can invoke any present context and any conception of scope-of-context ('in this room,' 'in 20th-century America,' etc.) without formulating it. And by requiring a recipient to provide its sense, they recruit the recipient into the speaker's project; they make the recipient complicit in forming up its sense.

Several further brief comments will have to suffice here:

1   The observation that formulating does more than simply naming what is formulated is focussed especially on 'formulating what someone is doing' in the March 9 lecture (pp. 544–6), and it sounds a theme central to the paper 'Formal properties of practical action' (Garfinkel and Sacks, 1972), though that paper was (according to Sacks) Garfinkel's work. In this discussion in Winter 1967 we see something of Sacks' 'take' on similar issues, possibly one source of discussions of this theme between them.

2   The considerations raised here (and when this theme is addressed elsewhere) impose a constraint on discussions of 'context' and its bearing on talk and action which has not been fully absorbed in the literature. The same problems raised about the categorization of persons/members pertain:

the set of available characterizations is indefinitely extendable;
the selection of some one or more is potentially a way of doing something, (i.e., is open to such understanding by others);
in actual interaction, such possible interpretation by interlocutors and the responses they may offer in turn, can serve as a constraint on actually selecting such a formulation;
the absence of such a constraint in the activities of professional analysts leaves the grounds of such choices undisciplined, and therefore problematic.

The positivist solution to this problem (i.e., constraining the choice of formulation by explanatory adequacy as attested by 'evidence,' leaves the

actual orientations of participants out of the picture. Where 'context' is made
a central notion, these concerns will have continuing relevance.

   3   The effort to cast 'therapist/patient' as an omni-relevant categorization
device has as one continuing relevance the concern with the bearing of gender
(and perhaps other of what Hughes (1971) used to call 'master statuses') on
talk-in-interaction. Were those who bring considerations of gender to bear on
all phenomena of interaction to take seriously the considerations touched on
just above, they might undertake to show that the pervasive relevance of
gender can be grounded in the demonstrably equally pervasive orientations to
it by participants to interaction. In effect, this would amount to showing that
the categories and terms of gender identification are omni-relevant for
interaction.

   Sacks' exploration of this issue in Winter 1967 is left unresolved. By the
time he comes to cast the indicator terms as ways of invoking the
settinged-ness of the interaction without formulating it, the problem of
establishing omni-relevance of either member-formulation or context-
formulation has been abandoned. In its place is the possibility of non-
formulation, of a kind of specific abstractness in treating the contexted
character of activity. But the exploration of omni-relevance is taken up again
in lecture 14 for Spring 1967 (cf. discussion below at pp. liii–livff.).

   One theme from the 1964–5 lectures which reappears in the Winter 1967
lectures, reapplied to a related topic, is that of 'direct' versus 'in-various-
ways-non-direct' speaking; the topic to which it is now applied is 'euphe-
mism' (or what may be, once the data are examined, better termed 'irony').
Although the 1964–5 lectures asked over and over again 'how to do X
without doing it overtly,' the message here is that to ask why a euphemism
or ironic trope was used instead of a direct or 'literal' saying is to get the
question wrong. What Sacks is urging here (March 9, 1967, pp. 545–6) is
that the first-order consideration is not directness/indirectness or literalness/
figurativeness. Rather it is (for the speaker) a saying which displays its
relevance at that point in the talk, and (for the hearers) a saying such that
their understanding (their *capacity* to understand) 'proves' the utterance's
relevance. The 'norm' is not, in the first instance, direct or literal reference,
but rather ways of talking that are *locally adapted* and can show *local
relevance*.

   The first-order considerations are thus tying rules and other local connec-
tions between elements of the talk, rather than 'saying it directly.' The issue
of 'directness/indirectness' comes to the fore only with academic analysts
determined to understand the talk 'in general,' stripped of its local context.
For them what comes to identify a bit of talk, to constitute its re-referable
core, is its semantico-lexical content and perhaps its pragmatic upshot. With
that as the core, then various ways of realizing that central identity can come
to be formulated as more-or-less straightforward, direct, literal, or 'tropic' in
some respect. What was *in situ* a production tailored to the details of local
context is reinterpreted as a design for indirectness when local context is

stripped away and no longer accessible as the source of the utterance's design.

How is this line to be reconciled with the analysis in the 1964–5 lectures, where just this question is asked – e.g., why seek out the other's name without asking for it directly? Perhaps this is one locus of development and change in Sacks' thought during this period. But it is also possible that when the embodiment-of-indirection cannot be understood (by recipient, or by professional analyst) as an adaptation to the local context, then the question of why the indirect rather than the direct may in fact be warranted and useful, and in just those terms.[34]

X

There are three predominants 'casts' to the lectures of Spring 1967.

As noted earlier, the first seven lectures (not published in this edition) constituted the first sustained set on turn-taking, expanding the treatment in the lecture of March 2 in the Winter 1967 set. This is a 'sequential organization' cast.

Lectures 8–9, earlier treated in lecture 3 for Spring 1966 and subsequently published as 'Everyone has to lie' (1975), have what might be termed more of a 'socio-logic' cast – juxtaposing to what might appear 'logical' ways of analyzing the conversational materials properly socio-logical ones.

From lecture 11 on, the materials take on the same flavor of anthropological/cultural analysis that so heavily informs the Spring 1966 set. This is largely the result of a focus on membership categories underlying talk and relationships between those categories (their relative positionedness for instance), notions of activities 'bound to' those categories, and the sorts of commonsense 'knowledge' organized by reference to those categories (in the manner of 'Y do X,' where Y is a category name, such as 'women,' 'freshmen,' 'politicians,' etc.) Some of this material was organized into a draft manuscript under the title, 'On a device basic to social interaction,' around the time of writing of 'An initial investigation . . .' As introduced into these lectures, much of the earlier statement seems to have been substantially refined.

The discussion here will be limited to some reflections on the "Everyone has to lie" analysis and on the reconsideration by Sacks of the matter of the

---

[34] And Sacks does sometimes work on an utterance by addressing, what it *prima facie* would be *out* of context, in a more-or-less 'literal' hearing, and with good results; cf. Spring 1966, lecture 29 pp. 461–2, where he shows how various components of the utterance "Usually there's a broad in here" are neither produced nor grasped in their 'bare' literal sense: e.g., 'here', means not 'this place' but 'when we are in [therapy] session;' 'a broad,' means not 'some woman' but 'the same woman,' indeed 'a particular same woman,' and one who is a member of the group, etc.

omni-relevance of formulations of setting and participants, earlier taken up in Spring 1966 and in Winter 1967.

At least one underlying source and rationale for the animating question being addressed in the 'exercise' concerned with the assertion "everyone has to lie" is formulated by Sacks (Spring 1967, lecture 8, p. 549) as "How could we as social scientists go about saying about something that a Member said, that it's true." It may be useful to 'unpack' the background for this question at least partially.[35]

As rhetoric as a core method and discipline for the analysis of what can be said gradually became demoted in the intellectual hierarchy of western culture, and logic developed an increasing hegemony, it brought with it an increasingly exclusive preoccupation with 'truth' as the paramount feature of assertions requiring definition and assessment. In part this concern was in the service of 'science,' and its aims of establishing stable propositions about the world whose truth could be established once and for all.

When attention began in the 20th century to turn to statements in so-called ordinary language, the analytic apparatus available for use was that of formal logic, and it was in part by virtue of the results of applying a formal logic developed in the service of science and mathematics to ordinary language that natural languages were found defective and the need for 'formal languages' made compelling. But the goals of logic/science and ordinary discourse are by no means the same, and the use of language in them may be quite different. What is relevant to establishing the truth of a proposition in science – and what might be 'meant' by 'truth' – may be quite different from assessing the truth of a 'commonsense assertion' in ordinary circumstances. It is this gap which, in part, Sacks is addressing.

Here, as elsewhere, Sacks' exploration of this theme (the contrast between 'common sense' and 'scientific' procedures) is focussed on a class of terms which is especially symbolic of logic – quantifiers. In 'An initial investigation . . .' as well such a term had become a focus of analysis. There it was the term 'no one,' in the claim by a suicidal person that they have "no one to turn to," and Sacks undertook to explicate how 'no one' is used, and used 'correctly,' given the 'paradox' that the assertion is made precisely in the conversation in which its speaker has turned to 'someone.'

'Initial investigation . . .' showed how "no one to turn to" was not belied by having turned to someone for the conversation in which it was said because 'no one' had as its scope only certain categories of person; 'no one' was not being used in some formal logical sense, as 'no person.' It was therefore misguided to begin with a 'logical' understanding of the term, when that was not the use being made of it in the production of the utterance.

In lectures 8 and 9, the quantifier under examination is 'everyone.' Again, Sacks proposes not to begin with some sense of the term derived from logic (some 'strict usage' as he puts it), and find how trivially to disprove the assertion by showing that there is at least one person who does *not* have to lie.

---

[35] A similar question is taken up in Spring 1966, lecture 26.

Rather, he proposes that we must investigate anew, and for its usage in ordinary conversation, how a term like 'everyone' is constituted and used.

And more generally, assessing the truth of the assertion involves not just a manipulation of truth conditions, but rather an explication of those practices of talk-in-interaction which the assertion could reflect an orientation to, and whose actual operation could be what is being invoked in the asserted claim. In the context of this lecture, this refers to the contingencies of the 'How are you' question, its privileges of occurrence, its types of relevant answer, and how the further courses of action which its answers make contingently relevant affect the choice of answers in the first instance (pp. 556ff.). By the end of the discussion, this structure is generalized well beyond 'How are you,' and is used to specify where lying may be generically suspected, where confessions of it will be readily believed, etc.

In any case, what emerges as criterial to the inquiry is not a *logical* analysis of the component terms of the assertion and an assesment of their combination, but a *social* analysis of those contingencies of interaction which could give rise to the condition which the assertion claims. The upshot here is to blunt the *prima facie* application of 'logical' analysis as the first-order consideration in much the same fashion as several of the Spring 1966 lectures had the import of blunting the *prima facie* linguistic analysis of an utterance (cf. above at pp. xxxvii–xxxix, the discussion of 'the ordering of analyses'). In both cases, the tools of linguistic and logical analysis are shown to have their relevance and applicability constrained by, and contingent on, prior sequential, interactional and cultural specifications of the practices of talking underlying production of the utterance.

What emerges is, then, a wholly different conception of what the analysis of ordinary discourse should consist in. It is this result which is adumbrated by asking at the outset how social scientists might go about assessing the truth of what a Member says, and this which animates that question.[36]

In lecture 14 (from p. 594 to the end of the lecture) Sacks again takes up the question of the 'omni-relevance' of a category collection. In the discussion of Winter 1967, the issue became redefined as invoking a context (and potentially associated membership categories) without actually formulating them – invoking the sheer fact of 'settinged-ness' (cf. above, pp. xlviii–l). Here, the discussion remains focused on the possibility of omni-relevance.

What he means by 'omni-relevance,' Sacks says, is two-fold: 'on the one hand, there are some actions which, for their effectiveness [i.e., to be recognized as that type of action], involve categorial membership in that collection, and, on the other hand, until the course of action is ended, one can't rule out the further use of that collection.' The elegant solution to the problem of showing 'therapist/patient' to be omni-relevant in the empirical materials under examination lies in noting that the effective doing of an ending to the occasion requires reference to the status of one of the parties as

---

[36] This sort of inquiry may be seen to inform the first paragraphs of lecture 11 as well.

'therapist.' The point is made even more exquisite by 'the therapist' actually only hinting at the 'session's' closure, and one of the more experienced patients interpreting that hint for a new patient.

What is key to the solution is its focus on the efficacy of the utterance in implementing the action of initiating the ending of the session and the non-contingency of that action. Other actions could be understood to activate the relevance of the categories germane to their efficacy, but those categories might not on that account alone necessarily be claimable as omni-relevant. But accomplishing an ending is, first, a non-contingent occurrence for the occasion (the issue is not whether it will be done, but when), and therefore prospective, i.e., relevant even before an action might invoke it. It is this non-contingent prospective relevance of an action – an action which itself makes a membership category relevant – which grounds the argument for omni-relevance here.[37]

This lecture affords an especially clear example (as Sacks' own lead-in makes clear) of one form which his kind of theorizing took. It regularly began with an observation about the particular materials being examined (an observation, of course, commonly informed by his prior work and wide reading). That observation might then be 'developed:' its terms being given an 'anterior' development, i.e., he would find and explicate what his own initiating observation could be seen, on reflection, to have presupposed; those presuppositions might well be more 'observations,' and more consequential ones. That package of observations might be followed up through discussion of matters in the literature which they touched off, through exploring purely formal kinds of logics they suggested, purely 'theoretical' possibilities they seem to entail, etc. But, recurrently, these 'theoretical' developments would be brought back to empirical materials – either what had initiated the whole line, or other materials which the line of theorizing brought to mind. It was in this sense that the effort was prosecuted to put theorizing at every point under the control of empirical materials.

The actual presentations sometimes obscured this way of working. In lecture 14, for example, Sacks begins with what appear to be very abstract considerations about applying categories to partition a population, and the relationship between the partitionings yielded by different category collections. This then is putatively 'applied' to the material at hand, in the analysis of 'teenager/adult' as a 'cover' collection preserving partitioning constancy with 'patient/therapist;' and in the covering of 'patient/observer' with 'performer/audience.' It was initially an observation about the latter – re the utterance "Testing" (p. 593) in particular – which motivated much of this line. Of course, the most extensive such reversal of order of discovery and order

---

[37] How Sacks' line of argument might bear on a claimed omni-relevance of gender (to re-pose an issue earlier discussed) is unclear. At the least, the constraint of "until the course of action is ended one can't rule out the further use of that collection" requires working out in any occasion being examined, specifically what 'the course of action' can be taken to be.

or presentation is the paper 'An initial investigation . . . ,' in which the originating observation was about "no one to turn to," the serious exploration of which led to formulating it as the result of a search procedure, which required formulating the terms of the search and the categories by reference to which it is conducted, etc. It was with the last of these that the paper itself began.

XI

The Fall 1967 lectures turned out to be the last at UCLA. Sacks' teaching during the Spring 1968 term was in seminar format, although he did offer sustained presentations on occasion, and these are included in the present volumes. And by Fall 1968 Sacks had moved to the University of California, Irvine (although there is no reason to think the prospect was already known at the time of the Fall 1967 lectures, or informed their delivery).

These lectures include the first extended treatment of turn-taking presented in these volumes, although the first seven lectures for Spring 1967 (not printed here) represented Sacks' actual first effort on this scale. The Fall 1967 lecture set is the only one in which Sacks offered extended treatments of both turn-taking organization and tying structures. Tying structures are discussed in several earlier lecture sets, but not again after Fall 1967. And the discussions of identification and categorization to which Sacks returned several times in the lectures preceding Fall 1967 are not taken up here, and henceforth reappear only sporadically and for much briefer treatment. Sequential organization increasingly dominates the agenda of Sacks' lectures, including expanding discussions of turn-taking, of sequence structure and adjacency pairs, of overall structural organization, of story-telling organization, etc.

If the Spring 1966 lectures were especially 'anthropological' in orientation, then the Fall 1967 lectures are especially oriented to linguistics.

This note is sounded early, when in the initial lecture, a general introduction, Sacks (pp. 622–3) projects the preoccupations of the course with 'sequential analysis' (though not under that name), which he introduces by remarking that ' . . . the discoverable aspects of single utterances turn out to be handleable – perhaps handleable only – by reference to sequencing considerations . . . ,' and declaring his interest in ". . . how it is that sequencing considerations turn out to be implicative of what happens in a given utterance."

"Linguistics," by contrast (he argues), "is that study of the utterance which involves detecting those features of it which are handleable without reference to such considerations as sequencing; i.e., without reference to that it has occurred in conversation" (ibid.).

One question, then, is whether "there is the *possibility* of . . . a fully comprehensive, coherent linguistics *without* such matters." Another is how such study of single utterances can be "brought into alignment with what we

know about sociology and anthropology. And if not, what then?"[38]

Recurrently throughout these lectures Sacks brings the results of a line of analysis or argument into juxtaposition with the main thrust of contemporary linguistic theory and analysis (i.e., of the early to mid-1960s). One result is the sketching of whole orders of observable regularity and apparent normative organization which have largely, in some cases entirely, escaped the notice of the main thrust of the contemporary study of 'language.' In some respects, this is undoubtedly related to the ambition of modern linguistics (tracable at least to de Saussure) to transcend particular contexts and media of language use – not only social and cultural settings, but also oral and written embodiments – so as to describe an underlying, presumably invariant, linguistic code. The attention to sequential organization – an order of organization seemingly inescapable in the effort to understand and describe actual, naturally occurring talk in interaction – forcefully belies the premise of the currently dominant commitments of linguistics. Running through both the Fall 1967 lectures and the presentations of Spring 1968 are several recurrent themes, whose central upshot is:

How sequential considerations necessarily inform or bear on the construction and understanding of single utterances;
How understanding of some talk is regularly displayed by its recipients; and
What that has required of recipients, and how those requirements are formative of *their* talk in turn.

These themes are returned to persistently, almost compulsively, and they are considerations of a 'foundationalist' sort – that is, they go to the matter of what foundations a discipline of language must be understood to rest on.

Sacks has seemed to some to have abandoned his commitment to contextually-sensitive analysis in turning to the study of sequential structure, and turn-taking in particular. But in insisting on the decisive relevance of sequential organization as furnishing the most proximate reference points of context, Sacks showed the consequences of disattending the fact that language was being used in a medium which was inexorably temporal and interactional. The results of these explorations of sequential context offer, in their own way, as sharp a contrast to formal linguistic analysis as did Sacks' earlier explorations in the 1964–5 lectures offer a contrast with Searle's efforts at context-free speech act theorizing (cf. above, pp. xxiv–xxix).

[38] Later (for example, in a letter to me in 1974) Sacks seems to have taken a different tack, namely, that a systematic discipline might not be buildable on the analysis of single utterances, or single instances of other units or occurrences, but that large amounts of material might be needed. At the time of his death, we had just begun a large-scale investigation of 'next turn repair initiators' which was going to be an exploration of that sort of undertaking. This subsequent development, of course, in no way blunts the impact which Sacks produced by asking what was to be made of the single utterance or the single sequence or the single exemplar of anything to be analyzed, and the detailed findings which this way of working led him to.

Appreciation of the recurrent linguistic orientation in many of these lectures should not be allowed to obscure the range and variety of matters taken up in them, and the diversity of the intellectual resources being called upon from many different traditions of inquiry. One case in point must suffice.

In lecture 6 for Fall 1967 Sacks returns to a point which had come up in earlier sets of lectures, concerning the inclusion in analysis of things which did not happen, here offering as one special relevance of 'next-speaker selection techniques' and 'paired utterances' (the later 'adjacency pairs') that they provide enhanced analytic leverage for speaking of something being absent – e.g., the utterance of an unresponsive selected next speaker, or the absence of a responsive paired utterance. The problem of warranting claims about 'absences' has resonated to many corners of the conversation-analytic domain of issues. Then Sacks adds (p. 670):

> A way, perhaps, to develop a notion of 'absence' involves looking to places where such a notion is used and attempting to see whether there are various sorts of relevance structures that provide that something *should* occur. Parenthetically, I'll give as a rule for reading academic literature, that whenever you see somebody proposing that something didn't happen – and you'll regularly find, e.g., sociologists, anthropologists, or historians particularly, saying that something didn't happen, something hadn't been developed yet – that they're proposing that it's not just an observation, but an observation which has some basis of relevance for it.

Sacks' interest in the matter of 'absences' antedates his work with conversational materials. He had taken a special interest in an observation of Max Weber's that some aspect of ancient Middle Eastern history was to be understood by reference to the fact that (as Sacks would put it in conversation) "that was before the appearance of the horse as an instrument of warfare."[39] The issue this posed was, how could something be the consequence of something which had not happened yet? Clearly some set of relevancies to which the theorist was oriented informed this way of thinking.

And, earlier yet, I recall a conversation at the Law and Society Center in Berkeley in 1962–3 (involving Sacks, a Marxist graduate student in sociology from Argentina and myself) in which the discussion lingered on 'explanations' for the absence of revolutions founded on the Marxist notion of 'false consciousness.' At issue were both the theoretical status of observations

---

[39] Weber (1952: 6, emphasis supplied):

> Because the nature of military and administrative technology of the time precluded it, before the seventeenth century BC, a lasting political conquest was impossible for either of the great cultural centers. *The horse, for instance, while not completely absent, at least, not in Mesopotamia, had not as yet been converted into an implement of special military technique.*

concerning the non-occurrence of revolution, and the reliance, in the concept of 'false consciousness,' on a stipulated account by the theorist/analyst of what the 'real' interests of the proletariat were, a correct appreciation of which was 'absent' from their (i.e., workers') understanding of the world. What made those 'understandings' relevant, such that not sharing them amounted to their 'absence,' and rendered other beliefs of the working class to be 'false consciousness,' with sufficient explanatory power to account for the absence of revolution?

So when Sacks refers in lecture 6 to a 'rule for reading academic literature,' there is specific background informing the line he is recommending. Having initially engaged this issue in the social science literature, Sacks came to find it illuminated in his engagement with interactional materials. For the underlying 'logic' was, although encountered in the first instance in academic materials, but an aspect of 'commonsense' or 'practical' theorizing which had been incorporated in professional social science theorizing.

Eventually Sacks pursued this matter with a variety of interactional materials. For example, in one of the 1964–5 lectures he remarks on the special intimacy and power of a line reportedly addressed to a beloved in explanation of some past bit of biography, "That was before I met you, and I was lonely then." Here again a 'state-of-the-world' is explained by something that had not yet happened, in a powerful display of retroactive relevance.

So these lectures of Fall 1967, however oriented to exploring their interface with contemporary linguistics, retain their grounding in social (even 'sociological') and cultural analysis. Indeed, it is at the meeting point of these disciplines that the analytic action of these lectures is situated.

XII

This volume presents roughly the first half of those lectures which Sacks chose to tape record and have transcribed. The introduction to this point has attempted to provide some thematic overview of these lectures, and somewhat more detailed background and exploration of a few selected issues.

This effort at an overview has been truly daunting, indeed, beyond my own capacities at the present time. Part of this may surely be traced to my own shortcomings. But, for the most part, it reflects rather the extraordinary richness and multi-facetedness of Sacks' corpus. In its variety, depth, and freshness of vision it defies domestication into convenient guidelines to a reader. At least part of this derives from the methodological character of Sacks' initiative – the new way of working he introduced. Starting out with a commitment to lay bare the methodicity of ordinary activities, and with his talent for seeing in singular occurrences the structural elements of which they were formed and composed, a world of data which refreshed itself every moment more than a legion of Sackses could ever make a dent in provided a virtual infinity of opportunities for new observations, and new orders of observation.

Not that it was easy! Sacks often complained about how hard the work was, and that it did not seem to get easier. He spoke in the early 70s of giving it up and working on something less demanding. The problem was, he observed, the need to see "around the corner," to penetrate through the blinders of the implacable familiarity of the mundane materials with which we worked, and the commonsense models and expectations derived from a social science which had never addressed itself to the simple observational tasks of a naturalistic discipline in which such models ought to have been grounded in the first instance. If we were to try to build a discipline, we needed to be able to be freshly open to what could be going on in any given piece of interaction, and to how activities and conduct could possibly be organized. And it was hard to say which was more difficult – to see clearly what was going on in some bit of material, or to figure out how to build from such observations and analyses a worthy discipline. And, of course, these were not independent orders of task – for how to address the empirical materials was always being informed by the direction in which it appeared a discipline might be pursued, and one surely wanted the character of the discipline to be shaped centrally by one's sense of how social activities were actually organized.

In any case, the main line of engagement for Sacks was in directly taking up particular occurrences, particular bits of tape and transcript. And in leaving as open as he could what there was to be noticed about that bit of occurrence, what there was to be learned from it, what we might get to see the importance of for the first time. And this insistence on freeing each next engagement with data from the past – not only the past of the social sciences, but also past work of this sort, including (especially) his own – while still allowing it somehow to inform analysis is what allowed each new fragment of data, each next look back at an old fragment of data, to provide a possible occasion of discovery. Although the sorts of things which emerged (however rich and multifaceted) were constrained by the particular metier of his mind, their range was truly astounding. They overflow efforts to contain them and package them for overview.

Introduction

Beginning with the Fall Quarter of 1968, Harvey Sacks' lectures were delivered at the then recently established Irvine campus of the University of California. The spirit of the new campus – at least of its School of Social Science under the leadership of its Dean, James March – was quite in keeping with the character of the 1960s. It was infused with a sense of possibility in its academic and scientific ambitions and was correspondingly innovative in organizational form. It dispensed with traditional academic disciplinary boundaries and encouraged small groups of faculty to develop new research enterprises and to define the terms – and requirements – of graduate degrees. The central theme was the unleashing of high quality minds to follow their scholarly and scientific instincts wherever the subject-matter, the theoretical thrust, or the methodological possibilities seemed to lead, free of the constraints imposed by traditional conceptions of disciplinary boundaries and other "professional" obstacles to developments which could genuinely surprise.

Whatever elements of his situation at UCLA suggested the possibility of leaving, the animating ethos of Irvine's School of Social Science was very well suited indeed to Sacks' own intellectual métier and character, and to the disciplinary iconoclasm of his intellectual enterprise. It was a felicitous matching of person and institution. Although Sacks developed a number of close ties to faculty colleagues and played a distinctive role in the inescapable politics of the academy – politics whose importance was amplified by the minimized institutional apparatus of the School – in his work Sacks pursued his own course and did not establish sustained collaborative undertakings with others on the faculty. This too was a viable possibility within the School's culture. Sacks spent the remainder of his academic career at Irvine, although at the very end he was considering another move.

There is little question that the character of Sacks' work as it is displayed in these lectures (as well as in those of Volume 1) was in various ways shaped

---

The introduction to Volume 1 presented some biographical information on Harvey Sacks' education, and set the early phases of his work as presented in his lectures from 1964 to 1968 in the context of the academic social science of the time. That material is not repeated here, and the reader interested in this background is referred to the prior volume. The present introduction is concerned less with tracing linkages and contrasts between Sacks' work and other developments in social science (although there is some discussion of this sort) and more with the treatment of Sacks' work in its own terms.

I am indebted to Paul Drew and to John Heritage for reading a draft of this introduction on my behalf, and for the collegiality and helpfulness of their responses.

both by the larger social and cultural *zeitgeist* of America in the 1960s[1] and
by the specific local ambience of southern California during that period,
within which the scene at Irvine played itself out. A delineation of those
connections will have to await another occasion. But there is equally little
question that Sacks' *oeuvre* cannot be reduced to the socio-cultural environ-
ment in which it happened to emerge. The distinctiveness of his vision was
formed before the 1960s, and his pursuit of a distinctive path antedated that
special time as well. And it was formed not only in California but in such
bastions of academic tradition as Columbia, Harvard and Yale.[2]

   There is much continuity between the lectures published in Volumes 1 and
2. Most notably, the extraordinary, detailed analyses of small bits of
conversation in which whole social worlds and whole ranges of personal
experience are dissected from out of apparent interactional detritus continue
to be interlaced with more abstract theoretical and methodological discus-
sions. Various substantive themes persist as well – most importantly the
preoccupation with sequential analysis, and a continuing tacit preoccupation
with how to conceive of "culture."

   There are discontinuities as well. Topically, discussions of membership
categorization devices per se are not resumed, although on occasion the
resources of that body of work and the problems attendant on "doing
formulating" figure centrally, for example, in the lectures for Winter 1969.
A concern with storytelling in conversation which first emerges in the Spring
1968 term is much more fully developed, beginning with considerations of
sequential organization but extending into quite new analytic directions.
Observations about sound patterning and other "literary" aspects of word
selection emerge for the first time, and are taken up in several of the lecture
sets.

   Thematic and analytic continuities and innovations aside, there are some
new stances taken up in the lectures published in Volume 2 to which it may
be useful to call attention, if only briefly. Some of these may serve to suggest
connections between the several sets of lectures which compose this volume;
others may serve as ways of focussing an initial orientation to each set of
lectures in turn. I begin with a theme which first appears in Fall 1968 but
recurs thereafter.

I

One apparent shift of stance which appears concomitant with the move to

---

[1]Recall, for example, (as a Los Angeles commentator recently did) that among the events
of just 1968 were counted "the year of McCarthy for President, the fall of L.B.J., the
assassinations of King and Robert Kennedy, the Beatles' White Album, Motown and "2001:
A Space Odyssey"; of war, orgy and dreams of peace, in the summer after the Summer of
Love" (*Los Angeles Times*, August 23, 1991).
   [2]Views which reduce work like Sacks' to something like the product of a California flower
child (for example, Gellner, 1975) are not only demeaning and intellectually evasive in
dismissing by epithet what they cannot decisively engage in substance; they are factually
ill-informed as well.

Irvine is a turn toward systematicity and toward the relevance of substantial amounts of data, that is, aggregates of conversations or of instances of particular phenomena in it. Consider, for example, the stance which Sacks adopts in launching his discussion of turn-taking in lecture 3 (and continuing into lecture 4) for Fall 1968. Among the key points in this new stance are the following (all from lecture 3, p. 32):

> What I want to do is to lay out in as general a way as possible at this point how the sequential organization of conversation is constituted.

Note the shift to "general" and the generic reference to "conversation."

> I start out with two observations about single conversations. . .

Note that although the observations are about "single conversations," they are about aggregates of them.

> I give in this first instance no materials for the observations, in that they are grossly apparent.

Note this shift in practice; nothing *in particular* is the point of departure; an observation about a regularity in an aggregate is the point of departure.

> By the term 'grossly' I mean that while they're overwhelmingly present features, they are also sometimes not present features – and their sometimes non-presence is something I will talk to at considerable length.

Note that the issue here is the dealing with occurrences that depart from a general practice, "sometimes non-presence."

The shift, then, is to:
an order of organization, rather than a particular practice, of talking;
a class of places in an aggregate of data, rather than an excerpt;
an organizationally characterized problem or form of interactional work, rather than an individually designed outcome;
invariancies of features rather than context-specified practices.

This is not, of course, a total shift of procedure. In lectures 5 and 6 Sacks again presents particular materials, and explores turn-taking issues (among others) in the context of a developing set of observations about that excerpt. But there are readily observable consequences of this shift in point of departure and analytic stance; one of these is an increasing (or increasingly explicit) orientation to organization and structure in the domain of conversational conduct. Again, discussion must be limited.

Near the beginning of lecture 4 (p. 44) Sacks develops the point that there

are grounds, built into the organization of conversation, for listening to every utterance for any participant willing to speak if selected, or willing to wait if another is selected to speak. The upshot:

> So again there's motivation to listen, which is independent of any rule that would say 'you ought to listen in conversation;' motivation to listen which turns on a willingness to speak or an interest in speaking.

This is not first time this point has been made in these lectures, but it has a different resonance in the context of the new casting of turn-taking. What is its interest?

Let us note first that the core point seems to be a grounding of listening to utterances in the technical requirements of talking or not talking, the technical requirements of the organization of proper conduct in that regard, rather than its grounding in a normative injunction directed to that outcome specifically. That is, an analytic concern for parsimony is at work here, setting aside a normative constraint, a "rule" if you will, designed specifically to secure "listening" or "attentiveness," or showing that such a rule, if there is one, is not there solely to secure attentiveness, because attentiveness is already a natural, a technical, by-product of the organization of turn-taking.[3]

Now this is surely not to deny a normative component to the organization of interaction or conversation; surely, the sorts of mechanisms by which the turn-taking organization is constituted are normative in character, for the participants and consequently for analysts.[4] On the other hand, it does seem to subordinate considerations which might be termed "politeness" to ones which might be termed "technically constitutive" or "sequence organizational."[5] The parsimony considerations here seem to take the form: what sort of basic organization would both drive the prima facie organization of the talk *and* engender whatever auxiliary effects seem to be involved.

One implication is that listening is not vulnerable to (or is less vulnerable to) whatever it is that may weaken persons' commitment to observe

[3]Subsequently, in lecture 2 for Spring 1972, pp. 535–7, Sacks returns to this theme in the context of his discussion of adjacency pairs, the virtually unrestricted freedom of occurrence of their "first pair parts," and the potential usability of first pair parts for selecting a next speaker. From this, Sacks observes, it "falls out" that a participant willing to speak if selected to do so will have to listen to everything said, for at any point a first pair part selecting them may be done. This account in Spring 1972 is different only in its focus on adjacency pairs as instruments of next speaker selection, rather than on the turn-taking organization per se.

[4]And, indeed, at Fall 1968, lecture 4, p. 50, Sacks proposes, "We have in the first instance, some formal normative features for conversation, which are in a way a public law for conversation: One party at a time. . ." etc.

[5]Compare here the discussion (introduction to Volume 1, p. xxviii–xxix; l–li) of the treatment of "indirect speech acts" with primary respect to considerations of politeness and sequential organization respectively.

normative constraints.[6] The point here is that the basis for listening is not as much at risk as injunctions to be polite, when violations of politeness had become, for example, a systematic political tactic on university campuses. Listening was grounded in self-interest (wanting to talk, or being willing to) and the technical requirements of implementing it. Departures from "features of conversation" should be understood, therefore, not so much by reference to motivated deviation from rules prescribing them as by reference to modified operation of the system of which they are a by-product – for example, in response to variations in context or transient problems in internal coordination.

Note the bearing of this tack on the claims of certain forms of "intentionalist" theorizing (such as those of Searle, 1991) that our knowledge of human action or conduct has only been advanced when "patterns" (as Searle calls them) can be shown to be the causal products of intentions to produce them. If the stance taken here by Sacks is correct, then observed distributions of attention (i.e., observed patterns of listening to others' ongoing talk) may best be understood not as the product of an intention to comply with a rule mandating such attention (even if there was such a rule), but as an imposed requirement for achieving such outcomes as talking if asked to, or withholding talk if another is asked to. (For a more general statement of this theme, see lecture 2 for Spring 1970, and the discussion of that lecture below at p. xxiv and n. 17).

Sacks' grounding of the organization of attention/listening in the individual participant's willingness to talk if asked to or to remain silent (even with something to say) if another has been selected to talk, itself embodies a distinctly sociological theme in accounts of social order. Developed in Sacks' account of turn-taking most explicitly at lecture 4, pp. 50–2, this theme understands the enforcement of the turn-taking organization to work by its identification with individual participants' rights and interests. So understood, individuals are mobilized to defend their rights and interests (e.g., their turn space); the emotions are recruited to this enterprise as well, such that violations of "one-at-a-time" become treated as invasions of some speaker's right, and that incursion engenders anger in defense of those rights, that emotional energy being put in the service of a socially organized enforcement mechanism for the turn-taking organization. Further, gossip, reputation, and the like can be recruited into that enforcement mechanism as well, e.g., under the aegis of violators being "rude." This, then, is how this class of violations gets seen as violations of "politeness," and it is in this light that we should understand at least some "politeness" considerations. That is, it is by reference to "politeness" that sanctioning is *vernacularly formulated*, while the actual occasioning of the violations may be less a matter of normative etiquette and its violations, and more a matter of technical organization or action implementation, effectuated through the identification of individuals'

---

[6]Something which was, of course, increasingly remarked upon in the 1960s, and certainly not less in southern California than elsewhere.

rights/interests with the resource which the turn-taking organization distributes.[7]

Throughout this discussion, it is apparent that considerations of systematicity, structure and organization play an important role in understanding orderly conduct observed across aggregates of data.[8] Although not all of the Fall 1968 lectures display this stance, it does play a continuing (even an increasing) role in Sacks' subsequent work, including subsequent lectures, for example, the lectures of Spring 1972 on adjacency pair organization.

II

Although "turn-taking organization" is the substantive focus for the Fall 1968 lectures, Sacks does not begin the course with a lecture on that topic; indeed, he does not begin his discussion of it until lecture 3. The first two lectures present another "take" on the "second stories" theme first treated in the previous spring, at UCLA, and it may useful to linger for a moment on what Sacks was doing in starting this course the way he did.

Note that the first lecture announces that it will be concerned with something other than what Sacks otherwise plans to focus on. He begins:

> Hereafter I'll begin with some rather initial considerations about sequencing in conversation. But this time I'm going to put us right into the middle of things and pick a fragment that will introduce the range of things I figure I can do.

He does this, he says, in order not to stake his claim on the usual insignia of academic work (". . . its theoretical underpinnings, its hopes for the future, its methodological elegance, its theoretical scope . . ."), but on the "interestingness" of the findings. This was a task which Sacks set himself in the late 1960s – to have "bits" with which to tell lay people (including, for this

---

[7]The theme of ensuring outcomes by identifying them with individuals' property, interests or rights – a familiar theme in certain "liberal" traditions of social theory – comes up again in a strikingly different context in Sacks' treatment of the motivated preservation of experiences in memory for later retrieval and telling (cf. Spring 1970, lecture 5, pp. 257–9, and below at pp. xxv–xxvi).

[8]Another kind of consequence of this new stance, especially with respect to asserting claims about aggregates of data rather than specific data fragments, is an occasional vulnerability in the grounding of some claims in these lectures. Without materials as a shared point of departure, it is at times unclear what actual things Sacks is talking about, and, therefore, how to assess what he is saying. There are assertions, when the work takes this form, about things which are said to happen "all the time," which may not seem all that familiar to the reader. (E.g., for *this* reader, p. 49: "Some people say about each other, 'Why is it that we can never have a conversation without it ending up in an argument?' And in that it is a thing that is said all the time, it is of interest to see how it could be sensible.") Of course, what Sacks asserts – at times *ex cathedra* – and the tack which he takes, regularly turn out to be of great interest for their strategy of analysis even when subject to such reservations.

purpose, other "straight" academics) what "the work" consisted in which would have a kind of transparent appeal and interest, readily presentable and graspable in a relatively non-technical way, capturing "experiences" virtually anyone would have had access to more or less directly, etc.

For a while, a regularly offered "for instance" was what Sacks proposed to be an exemption from the ordinary recipient-design "rule" or "practice," for (among other forms of talk) storytelling – "Don't tell others what you figure they already know." Sacks proposed that there is an exemption for spouses. This is to be understood as a practice coordinate with a mandate to tell spouses many things first, before they are told to anyone else. Then, given that spouses are present together on many interactional occasions and that each would have been first to be told most tellables, without the exemption many tellables would have major constraints on their subsequent tellability to others.

But the exemption engenders its own troubles. Because spouses' presence need not deter re-tellings, spouses may find themselves having to hear the same stories over and over again. And the presence of an already "knowing" person can have consequences for the form that the telling takes. As a result, there is a pressure for the separation of spouses in social occasions where these various cultural practices and orientations are in effect (thus, for example, rendering them free for groupings based on other features, e.g., gender).[9]

This was a neat little package, in which a familiar social experience did seem readily traceable to practices of talking which ostensibly had little to with them (or with anything of general interest), and was appealing and satisfying as an "illustration" of the work.

Much in these first two lectures has the flavor that would make it attractive on these grounds. Especially points well into the discussion of lecture 1, regarding the counter-intuitive relative paucity of "things to talk about" with those one has not talked to in a long time as compared with the ready supply with those one talks to daily,[10] are just the sort of thing that Sacks saw as useful in these ways. His departure from his planned theme in the initial lectures in order to do this repeat "take" on second stories may embody his treatment of the class members as part of a larger general public whch had to be appealed to, at least initially, on the grounds of common experience.[11]

One other aspect of these lectures which occurs in various of the sets but is striking in the Fall 1968 set is what I will refer to as an aspect of their rhetoric. One form which this rhetoric takes is the assertion, after some particular

[9]A version of this line of analysis appears in this volume as lecture 4 for Fall 1971, where, however, it is touched off by a particular data fragment, from which Sacks formulates the problem of spouses' talk.

[10]This theme is returned to in the initial lecture for Winter 1970, p. 172.

[11]In the lectures for Spring 1970, Sacks is explicit about the special cast being given the first lecture. Strikingly, the topic which here in the Fall 1968 lectures serves as the accessible beginning for the course becomes in the Spring 1970 lectures the "much more severely technical" (Spring 1970, lecture 1) material which warrants a more accessible introductory lecture!

analysis or type of analysis has been offered, of its "normality" as a scientific or disciplinary development. So, in Fall 1968, lecture 3, p. 38, Sacks proposes:

> In its fashion the history I've recounted is a perfectly natural history; i.e., it would be perfectly natural for whatever course of development of analysis of something that what you're looking for initially when you look at something – a plant, a social object, whatever it may be – is to find some parts. One would begin off, then, with things like 'greetings' and in due course come to things like 'one at a time' and 'speaker change' occurring.

Now, Sacks had read considerably in the history and philosophy of science, but the claim made here is merely asserted and not developed by reference to that literature. And what is asserted is an actual course of events of Sacks' own making, transformed into a putative generalized course of events which constitute normality or "natural history." The inter-convertability of modalities such as instructions and historicized descriptions is something Sacks was well aware of. It is a way of subsuming new departures, and a position staked out without benefit of colleagues close by, under an umbrella of "normal science."

Again at Fall 1968, lecture 4, pp. 54–5, Sacks invokes "naturalness". Having made a point about the co-occurrence of 'one at a time' and 'speaker change recurs' as features of conversation that are "basic," he then gives an argument for this basic-ness (i.e., that the system is self-organizing, in that breakdowns/violations are organized by reference not to some other rules but by reference to these very same ones).[12] And then:

> And I take it that that's an extremely natural criterion for some rules being basic; that is to say, when you reach them, you reach the ground. There are no other rules which deal with how to deal with violations of them.

It seems clear that this is not offered as an account of some actual history of usages of "basic," but as an effort to put into perspective the status of what he was proposing. Here the rhetoric of "naturalness" is "aggressive," in claiming a status within some putative developmental course of a discipline. Elsewhere, a more "defensive" (though hardly apologetic) tack is taken, as,

---

[12] A similar argument is made with respect to adjacency pair organization in Spring 1972, lecture 2; cf. below pp. xliv–xlv.

The contrast, it may be useful to mention (or *one* contrast at least) to this "self-organizing" property is the sort of feature taken up in the 'Two preferences . . .' paper (Sacks and Schegloff, 1979), which is concerned with "second order organization." There, if two features meant to co-occur (in that context, "minimization" and "recipient design;" as here, "one at a time" and "speaker change recurrence") are not combinable on some occasion, there is an *ex*trinsic procedure for reconciling the conflict, i.e., relaxing one feature until the other can be achieved. The parallel argument for "interruption" (as an instance of non-combinability of "one at a time" and "speaker change") being resolved in a "self-organizing" fashion has yet to be presented formally.

for example, in lecture 4 for Spring 1972, where Sacks offers an aside while launching a discussion of adjacency pairs by formulating three abstract utterance positions in conversation – "last, current, and next utterance." He says (pp. 554–5),

> A lot of this will sound awfully banal but it's far from that, so you'll have to jolt yourself – if I don't jolt you – into thinking that it's not, after all, something anyone could have said; it's not that it's nothing; it's not that it has no consequences.

This should be appreciated as being at least as much self-directed as addressed to the audience – either the physically co-present class or the audience wherever. It is a sort of girding of loins before battle; a sort of assertion of resoluteness.

In the intermissions and aftermaths of days we were working together, Sacks used to bemoan the difficulty of the work. One of his metaphors for it was the need to be able to "look around the corner of the future," that is, to be able to see ahead to that formulation of the organization of the world which would appear in retrospect to have been obvious. And often this seemed to turn on seeing in some (but not other) apparently commonsense characterizations of empirical objects their potential for carrying heavy and complex theoretic/analytic loads. One problem which this posed was the vulnerability to lapsing back into a mundane, vernacular, commonsense hearing/understanding of those terms – one which would not sustain the analytic load they were to carry, but would reduce to some "banal" pre-theoretic assertion. It is that sort of vulnerability – both in his audience and in himself, however differently for each – that this invocation seems designed to confront; and it is similar vulnerability and transient self-doubts which the "natural development" rhetoric seems designed to combat.

III

The Winter 1969 lectures presented here do not themselves compose a thematically organized set, or even several such. Rather, they present a variety of analytic topics and problems occasioned by efforts to come to terms with a single stretch of material taken from the first of a series of group therapy sessions with "adolescents" which Sacks had recorded (and, later in the course, other materials as well). Although some considerations raised in dealing with one part of this excerpt may come up in connection with another, these lectures do not appear to have been designed to constitute coherent, systematic treatments; still, in some instances (e.g., lecture 3) they do seem to come together quite nicely. For the most part, however, some fragment of the data segment is isolated for treatment, and then several sorts of interest in it are extracted and addressed.

Not that this detracts from the striking and unexpected lines of analysis

which Sacks develops from his materials in the various, largely independent discussions. The tone is set from the very beginning.

In the Spring 1966 lectures Sacks had examined the notion of "possession," and in various respects reconstituted what sort of a cultural artifact it is. In lecture 1 for Winter 1969 (although not explicitly related to the earlier discussion), he makes another sort of novel use of "possession" or "ownership." In discussing the noticing/remarking by one participant in the group therapy session on the hole in another's shoe, Sacks notes that that the shoe is owned by its wearer may entail that another cannot *take* it, but it does not entail that another cannot *talk* about it. Further, if another talks about it, it is very likely that its owner will talk next, or soon. So "ownership" is conversationally consequential.

Furthermore, one of the generic matters conversation is centrally taken up with is the things that the participants have brought with them to the conversational occasion – their clothing, possessions, bodies, events they enact, etc. The talk works off what the parties have brought; and parties can then bring what they bring in part by virtue of the talk that may be made about it. And persons may avoid being present to a conversation by virtue of what they must necessarily bring to it (e.g., the current state of their bodies, possessions, etc.), in view of the talk which that company is likely to make about it. Possessions are then relevant not only to "the economy;" they are central to the "conversational economy" as well. And "ownership" turns out to be a social/sociological category which is consequential in hitherto unappreciated respects.

There are other sociological threads running through many of the discussions in these Winter 1969 lectures. One such theme concerns group formation, membership claims, and different ways of "partitioning a population"[13] to find who belongs together and who not. As the last of these clauses may suggest, it is by way of interactants' deployments of membership categories and ways of identifying or formulating one another that these various topics are addressed. In lecture 2, the issue is posed by how someone is praised without impugning the status of the others (the issue being who is the same category with the praised one and who not). In lecture 3 it is the alternative ways of grouping two of the attendees of the therapy sessions – Roger and Al – together vis-à-vis the observer, as between patient/observer and performer/audience. In lecture 7 it is the issue of who is a "hotrodder"

---

[13]By "partitioning a population," it may be recalled, Sacks refers to the results of formulating a set of persons by reference to the categories in some empirically coherent set of categories, i.e., categories which compose "a set" in an empirical sense. "Partitioning constancy" (lecture 3, p. 110) describes the outcome when a same collection of persons are distributed in the same way by reference to two or more different sets of categories. Thus, later in this paragraph of the text, the category sets "patient/observer" and "performer/audience" divide up the co-present persons in cognate fashion – the ones who are co-members of the category "patient" in one set of categories being co-members of the category "performer" in the other; these category-sets then display partitioning constancy for this population of persons, or constitute "analog structures," as Sacks also refers to the matter there (ibid).

(or "hippie") and who not, who is "authorized" to make such a judgement and how some persons "patrol the borders" of the category. In lecture 8, the issue is posed by reference to alternative ways of seeing some collection of persons in some place as legitimate or not, via their alternative formulations as "gals and guys" or "den mother."

Another, more methodological, theme which informs a number of the lectures across considerable variation in substantive topic concerns the relationship between "intuition" and "formal analysis" on the researcher's side on the one hand, and the relationship between analytical "formality"/ "abstractness" in contrast to the "concreteness" of "lived experience" for the "ordinary actor" on the other.

Sacks' characterization of what he is doing in lecture 2 – on "safe compliments" – is instructive; its logic here echoes that of the analysis of "invitations" as early as Spring 1966. In a discussion initially targetted at "the weather" as a "safe" topic, Sacks begins elsewhere:

> I did some work on 'compliments,' specifically on what I called 'safe compliments,' the idea being to see what it was about some compliments that made them 'safe' compliments, i.e., *to turn an initial observation into an analysis* . . . The question then is, can we extract from the sort of thing [some particular compliment] is, a set of features which will locate a class of compliments like it, which are also safe compliments? Where that is a test of the fact that we had some generative features. [emphasis supplied]

Then, after developing an analysis of what makes one class of compliments "safe.":

> Now the question is, with respect to 'weather talk', what do we need, to be able to show that 'the weather' is a 'safe topic'? What we need is to develop a notion of 'safe' for topics *so that we can have said something when we say 'weather' is a safe topic.'* The discussion on 'safe compliments' was to give a sense that something could be done with a notion of 'safe', *something of a formal sort*, i.e., *it doesn't have to be merely an intuition*, but what's involved in something being 'safe' can be laid out. [emphasis supplied].

Now it should be clear from this treatment that what the professional analyst might come to analyze as the formal features that make for "safeness" – whether for compliments or for topics – is proposed to be "real" for parties to talk-in-interaction; it is for them, after all, that it is proposed that the "safety" matters, and they who may suffer from the lack of it. Still, such formal accounts are vulnerable to charges of "formalism," of imposing analysts' categories onto the lived experience of the participants, and the like. To this theme it is useful to juxtapose Sacks' discussion in lecture 3 of one way in which two of the "patients" in the group therapy session deal with the fact

(of which they have been apprised) that there is an observer behind a one-way mirror in the room. They "enact" a scene of "personnel just before a performance," calling out "Testing, one two three" and the like. It is in this regard that Sacks points out the "partitioning constancy" in that setting between "patient/observer" and "performer/audience," which allows the latter set of categories to provide a set of "cover" identities, at least transiently.[14]

Now this appears to ascribe to the teenage therapy patients a kind of abstract or formal analysis of their circumstances which may appear to violate our understanding of their lived experience. But Sacks argues (lecture 3, pp. 110–11) that what is at issue in using a "theater" frame to deal with the presence of an observer is that people

> have their circumstances available to them in an abstract way, such that they can use the abstract characteristics of their circumstances to locate other circumstances that stand in a strong abstract relationship to their current circumstances.

The relevance of this point is precisely to counter the objection to this whole direction of analysis that, in explicating underlying abstract or formal features of ordinary activities, violence is done to the lived-experience of those activities for the actors who engage in them. By contrast, Sacks is proposing here that part of ordinary Members' competence is specifically an abstract understanding of their circumstances and activities, an abstract knowledge drawn upon in constructing further courses of action, and usable to construct further courses of action in a fashion coordinated with others. Thus:

> How can they *use* that abstract knowledge? They are able to use such knowledge to locate circumstances which have features that stand in a strong relationship to the initial circumstance, and those features are then used to project actions by reference to those other circumstances, which actions have some hope of being picked up. It's not just one person who is by himself capable of that, but he can have hopes that others can see what he's doing, see it fast, and collaborate with him.

The transformation by analysts of intuition into "something of a formal sort" is thus not merely a requirement of disciplined inquiry; its results are themselves meant to capture features of the procedures by which ordinary conduct by ordinary members is methodically achieved.

---

[14]See the earlier treatment of this episode in Volume 1, lecture 14 for Spring 1967.

Aside from the focus which the text brings to this discussion, Sacks' demonstration of what might be involved in seriously grappling with the effects which observers might have on a "scene being observed" is a salutary one in refusing to settle for a simple and clichéd concern about "Heisenbergian" influences of observation itself. Rather, it insists on a detailed attention to how and what sorts of changes in conduct there might be, how they are to be understood, and how they would/might bear on what an observer makes of that conduct.

IV

The lectures for Winter 1970 begin with a focus on the overall structural organization of the unit "a single conversation," linger in lecture 2 on the theme of exploiting whatever topics come to notice in the intensive examination of a single conversation, and then return to considerations of overall structural organization. There is much here that is penetrating and revelatory, concerning such objects as "the reason for the call" and "reason for the call relationships," as well as "no reason for the call calls," and relationships built on them, to mention only some of the attractions of the first lecture.

There are elements in these lectures whose relevance is related to some of the new emphases which I earlier suggested inform the lectures starting in late 1968. I want to take note in particular of a passage of two to three paragraphs at pp. 168–9 of lecture 1 in which a theme first appearing in Fall 1968 reappears, and that is the relevance of examining a fragment from a conversation in the context of (or juxtaposed with) other products of the sort of "machinery" conjectured to be involved, other instances of the "same sort of thing;" that is, the use of aggregates of data. In Fall 1968 this theme surfaced in passing with respect to turn-taking; here it comes up in a more sustained way with respect to the openings of conversations, both (and especially here) on the telephone and in co-present interaction.

This is a topic – single case analysis versus working with collections of data – which is not uncontroversial, and which Sacks and I discussed at considerable length over the years. This is not the place for a thorough airing of the issues or of those discussions. The key point here in Sacks' treatment in lectures 1 and 2, however, is that a proper grasp of what might be going on in a conversational opening in some particular setting might require a grasp of the range which the "machinery" involved in the production of the phenomena involved could produce, and this might require examination of a considerable array of data.[15]

Once dealing with an array of data taken to be "comparable," a comparative analysis may appear to be needed, and this can itself give rise to some methods of analysis which may obscure how the material being studied may have been produced, rather than illuminating it. One such analytic procedure requiring considerable care and reflection is "format-and-slot analysis," in which the prototypic problem is cast as a selection among alternative terms which could be used for a same reference, or alternative items which could be employed at a certain juncture in the talk, a juncture formulated by the format of the talk in which it is embedded. It is not that this form of analysis is flawed in principle; conversation analytic treatments of reference – reference to persons, to places, etc. – have exploited it.

Sacks points out, however, that there are circumstances in which alternatives to a term actually employed would/could not be used, even if they were "correct." He takes as his case in point a telephone call in which the caller has

---

[15]See the discussion below at pp. xxxix–xl and n. 28.

called her friend about a commotion which was observed at the friend's place of work, a department store called "Bullock's." Sacks argues that in proposing that one has called to tell another "what happened at Bullock's today," the reference to "today" is not incidental. It is not properly understood as being selected from a set of cognate temporal references. Had the event happened several days earlier, the caller would *not* offer that temporal referent in the same utterance format; she might not tell the story, or find it tellable, at all. Indeed, given that the caller called in order to tell the story, she might not have called at all. For it is its occurence "today," Sacks proposes, which makes the event "news," and thus a possible "reason for the call," and hence in first topic position in the call. It is the fact that it was "today" that makes for a temporal reference being used at all, rather than a temporal reference being somehow slated to occur, with a selection procedure then invoked to find the term to be plugged into that slot. And further, it is not that its occurrence "today" makes it tellable as news per se; it makes it tellable to one with whom the teller talks daily. It might not be tellable to a twice yearly interlocutor, even if it happened "today," for it may not have the stature to be told in a six-monthly conversation. So all of the discussion is itself subject to considerations of recipient design. These widening ripples of analytic consideration surround the use of "slot-and-format" analysis, and may render its invocation questionable.

Lecture 2 for Winter 1970 (at pp. 184–7) contains what is to my mind one of the most striking discussions in all the lectures. Here Sacks turns a seemingly technical dissection of the mundane story mentioned above – about the commotion outside a department store told by one friend to another – into a stunning demonstration of the alternative grasps of a scene which may present themselves to different sorts of viewers – Sacks refers to it as having become "kind of a distributional phenomenon."

His account begins with the contrast between the actual teller's perception that there-was-trouble-and-the-police-were-taking-care-of-it on the one hand, and, on the other, what Sacks proposes others (e.g., residents of the "ghetto") might see as there-being-trouble-and-the-police-were-engendering-it. He proceeds through a series of further related observations, for example, the assuredness of the actual observer that her position as uninvolved witness is unquestioned, as compared with the possibilities which other categories of person finding themselves on such a scene would be required to entertain and protect themselves against – for example, the possibility that they would be treated as accomplices in whatever wrongdoing was suspected. The effect is to render the scene which the story is intendedly about as equivocal as the duck–rabbit of Gestalt psychology, and the actually told story as a situated, perspectival version of it.

Sacks' observations here carry the conversation-analytic treatment of an ordinary story told in conversation to an intersection with traditional themes of social and political analysis, and can well have served as a revelatory component of a liberal arts education for white middle-class undergraduates in Orange County, California in the aftermath of the Watts riots in Los

Angeles just to the north, in years which were, in all but their numerical depiction, still part of the 1960s.

This intersection with, and transformation of, vernacular understanding is, I would like to stress, *not* a time-out from technical analysis but a product of it. Sacks' discussion here should be juxtaposed with his discussion of "viewer's maxims" in the paper 'On the analyzability of stories by children' (1972b) (or the first lectures for Spring 1966 on which it was based), where the technical basis for these observations may be seen to have been rooted.

V

The set of lectures for Spring 1970 is as coherent and stunning in its range and perspicacity as anything in the collected lectures. It is the richest single set of materials on Sacks' treatment of storytelling in conversation, and surely central to our understanding of stories more generally.

Here as before (cf. lectures 1 and 2 for Fall 1968) Sacks announces the opening lecture[16] as one intended to appeal more broadly to the class than the material to follow, which he characterizes as "much more severely technical than most people could possibly be interested in." He continues here the practice of developing materials which could give "outsiders" a sense for this work and its possible payoffs in a relatively vernacular way. The "more accessible" materials of the Fall 1968 lectures, however, had become "much more severely technical" by Spring 1970 (at least they were going to be presented that way), and now were given their own, more readily accessible, introduction.

Whatever the long term relationship of ethnomethodology and conversation analysis turns out to be, this lecture as much as any other in the corpus of Sacks' lectures (at least those to which we have continuing access) exemplifies a convergence of the animating impulses of ethnomethodology and conversation analysis in its preoccupation with the "ordinary," the "normal," the "mundane" as achievements.

With lecture 2 Sacks begins the treatment of stories told in conversation. It is a beautifully organized and accessible account of the sequential problem of storytelling in conversation by reference to the organization of turn-taking in conversation, and the understanding of the "story preface" by reference to it (material later presented in Sacks, 1974). Perhaps two points may be underscored here which might be overlooked in a reading of the lecture for the aforementioned focus.

The first is Sacks' self-conscious attention to theorizing as an activity. He begins here – as he does in many other lectures – with what he calls an "utterly bland fact," one whose telling surely is not in itself of interest. The point, he remarks, is what can be made of such a bland fact. But many bland

---

[16]This lecture – supplemented by excerpts from lectures 2 and 4, and lecture 1 for Spring 1971 – has previously appeared in print (Atkinson and Heritage, 1984: 413–29).

facts lead to nothing beyond themselves. It is necessary, then, to have found and pursued such a bland observation as allows something to be made of it. In the end, then, the blandness or "obviousness" of some observation is neither grounds for ignoring or suppressing it nor, in itself, for asserting it, but for seeing if its achievement or consequences can be seen to be more telling than the observation itself.

Such concerns with "theorizing" appear recurrently in this set of lectures (as they do in the corpus as a whole). To cite but one additional instance, in lecture 3 Sacks remarks on the common practice in everyday life that persons take note of "coincidences" – for example, that they rarely go to some place, and their interlocutor rarely does, and that it was a coincidence that they both happened to do so on the same day and encountered one another there. He then proposes:

> I want to see if we can get at the beginning of an answer to how we come to see these coincidences. The interest in the beginning of an answer is not so much in whether it's an answer – I don't have any idea whether it's an answer – but in some way that the answer is built.

As with the blandness of the point of departure in lecture 2, the concern here is with the ways of building an account, of theorizing in the presence of data per se, rather than with the final assessment of the adequacy of the account. By the end of the lecture, Sacks is again proposing that much of the observable orderliness of the world may be better understood as the by-products of ambient organizations which are quite unconcerned with these outcomes, rather than as products which were the design target of some organization.[17]

In passing Sacks here produces an account of the perception of coincidences that makes of it not a mistaken commonsense notion of probability, but something like Marx' notion of alienation;[18] that is, that persons' own activities (here the practices by which stories are formed up) produce a result (an account of activities that is designed to make for relevant-at-that-moment tellable stories), which is then perceived not as a product of the design of storytelling, but as an independently encountered – and somewhat mysterious – "external" reality.

Additional discussions of this explicitly methodological sort in the Spring 1970 lectures include an interest in "doing provings" (lecture 5, pp. 251ff), "getting . . . a problem" (lecture 6, pp. 267ff) and the relationship between a "sophisticated lay observation" and more technical treatments (lecture 7, pp. 271–2).

---

[17]This is, then, a more general statement of a theme raised in Fall 1968, lecture 4, where "listening in conversation" was treated as a technical requirement and result of the operation of the turn-taking system, quite apart from any normative regulation explicitly concerned with "listening in conversation." Cf. that lecture, and the discussion above at pp. xii–xiv.

[18]For example, the account of "alienated labour" in the Economic and Philosophical Manuscripts (cf. McLellan, 1977: 77–87).

A second point worth lingering on is Sacks' treatment of the term "story." Especially in the years following these lectures there has been an explosive growth in interest in, and writing about, stories, narrative, "narrative logic," etc., with whole fields and sub-fields (e.g., "narratology") addressed to this subject-matter. Unsurprisingly, the growth of this academic and literary industry has spawned a profusion of definitions of the focal object – such as "story." Sacks parries the issues of "what is a story?" and "is this a story?" by asking not whether the label "applies" (i.e., is "correct"), but whether it is relevant – that is, relevant to the participants in producing the stretch of talk in and through which the object in question was produced. The issue is thus transformed from an "external analyst's" issue into a "a Member's issue:" how does it matter to the teller and the recipients that the talk being produced (*in the course of producing it*) is "a candidate story"? Lecture 3, and the other lectures for the term, go to this question for stories in conversation in a fashion that yields analytic leverage on the notion "story" for students of stories-in-conversation distinct from stories in other contexts.

Lectures 4 and 5 present, respectively, an extraordinary discussion of "entitlement to experience" (and to just the experience the events in question will sustain) as well as of the cultural organization of experience and the emotions, and a beautifully wrought account of "first" and "second" stories. But what I would like to call special attention to is the way in which Sacks brings an orientation to classical issues in social theory to a hypothetical – but compellingly plausible – account of cognitive organization (lecture 5, pp. 257–60).

Using the metaphor of "designing minds," Sacks asks how the preservation of "experiences" might be organized. One cogent possibility might be to store experiences by what would commonsensically be considered their most important or salient aspects, or their most central character(s), or events, etc. As an alternative he proposes the possibility that experiences be stored "in terms of your place in them, without regard to whether you had an utterly trivial or secondary or central place in them" (p. 258). The consequences which this might engender – both for the organization of memory for experience and for social intercourse about experience – are then cast in terms of the concerns of social theory about the relationship between private interest and the public good.[19]

> And that might have the virtue of providing a generalized motivation for storing experiences. If it's your part in it that you use to preserve it by, then it might lead you to preserve lots of them, simply in terms of the idea of experiences being treatable as your private property. People can then collect a mass of private experiences that they then, by virtue of their generalized orientation to 'what's mine,' have an interest in keeping. You might, then, design a collection of minds, each one storing

[19] A theme which Sacks had invoked as well in the account of turn-taking presented in Fall, 1968, Lecture 4, pp. 50–4 and cf. discussion above, at pp. xiii–xiv.

experience which is to be used for each others' benefit, though you
couldn't necessarily say "Remember all these things so that you might
tell them to somebody else." You have to have some basis for each
person storing some collection of stuff via some interest like 'their own'
interest. Where, then, you get them to store experiences in terms of their
involvement, but have them be available to anybody who taps them
right.

This sort of linkage between social organization and the organization of
personal experience and its cognitive and emotional substrate – between the
social, the psychological and the biological – will surely have to be successfully
made eventually, and this is a novel and provocative direction in which it
might be pursued.

   In its more immediate context, however, Sacks relates it stunningly to such
diverse ancillary themes as the personal experience of being understood or not
and the training requirements for professional therapists.

VI

Whereas the lectures for Spring 1970 were thematically coherent and
focussed on storytelling, the materials for Winter 1971 (very likely a graduate
seminar, rather than an undergraduate lecture course) deal with a congeries of
more loosely related matters. But the central preoccupation is with "word
selection" (cf. Sacks' reference to "procedures whereby the words that people
use come to be selected;" March 4, p. 308), and in particular those
considerations of word selection that are often associated with "poetics." This
set of presentations (complemented by the lecture for May 17 in the Spring
1971 set, a lecture which deals with an eerie spatialization of metaphors,
idioms, and other aspects of the talk of both parties in an emergency
"psychiatric" phone call) constitute the basic point of depature in Sacks'
teaching *oeuvre* for this still largely unexplored domain of phenomena.

   This central preoccupation aside, special attention may be called to the
presentation of March 11 which (at pp. 325–31) offers another one of Sacks'
astonishing *tours de force* of analysis and interpretation. He starts with the text
of a sequence which seems to be ordinary enough, even if in it a couple appear
to press an offer of herring to an almost absurd extent. What Sacks does is to
lay bare layer after layer of organization and preoccupation (on the parti-
cipants' parts) – from the differing grounds for *making* an offer than for
re-making it, to the tacit relationships between the parties that emerge into
relevance over the course of the sequence and come eventually to drive it, to
the ways in which processes such as those which this sequence embodies can
be a major component in both the stereotype and the enforced actuality of the
elderly in a society such as this – that is, the United States in 1971. We cannot
know whether the account which Sacks develops is biographically accurate for
this particular family, but it feels compellingly on target for the sorts of

interactional processes which can constitute the lived interactional reality for many persons. It is a signal display of Sacks' ability to use a fragment of interaction to capture in an analytically compelling way a whole complex of social reality, from its social-organizational sources to its interactional embodiment to its experiential consequences. This discussion presents as well both ends of a range of types of analysis which often appeal differentially to readers of conversation-analytic work.

One end of the spectrum takes a particular episode as its virtually exclusive focus, with its scope of generalization being defined by "however this analysis turns out." Various particulars of context are traced through the full array of their consequences; here, for example, that the offer-recipient – Max – is a recent widower, and the offer-makers find themselves (on Sacks' account) newly responsible for his well-being. The contingencies of the offer and its rejection, the relevance of pressing the offer and the import of its further rejections – all are understood by reference to these attributes of the participants, and the growing relevance of these attributes over the developmental course of the sequence. The account thus appears compellingly context-specific.

The contrasting end of the analytic spectrum focusses on the *type* of sequence involved, across variations in particular settings of enactment. For example, how is this sequence type – e.g., offers – related to other sequence types? Sacks had a long-term ongoing inquiry on request and offer sequences, and their relationship to each other and to other sequence types. Some of Sacks' students have also pursued these questions in this more categorical fashion. Davidson (1984), for example, writes about "subsequent versions of invitations, offers, requests and proposals dealing with potential or actual rejection" (and see also Davidson, 1990). For dealing with the episode in the March 11 session Sacks finds it more in point to juxtapose

> an 'offer' as something different than a 'request' or a 'warning' or a 'threat.' But in some situations the offer is simply the first version of getting the person to do something.

That is, the mode of analysis being pursued can lead to different sets of alternatives providing the relevant comparisons or contrasts, "offer" making such alternatives as "warning" and "threat" potentially relevant here, even if they are not in other contexts.

Though there may appear to be a tension between these two modes of proceeding, with the former often appearing more "humanistic," "context-sensitive," and "holistic" and the latter appearing more "formalistic" and "scientistic," Sacks pursued them both. And the Winter 1971 materials show them pursued hand in hand – the word-selectional considerations being pressed in a generalized cross-context fashion, with this extraordinary single case analysis occurring in the same class session.

VII

In contrast to the Spring 1970 lectures which developed a coherently focussed account of storytelling in conversation and did so by sustained examination of a few data fragments, the Spring 1971 lectures (like those of the preceding term) vary both in topical focus (from sound ordering to professional–client interaction) and in data sources (from the "group therapy session" to a telephone call invitation from one student to another to a call to a suicide prevention center).

Among these lectures are included a series – those for April 30, May 3, May 10, May 17, and May 21 – in which Sacks takes up the empirical materials which he addressed at the start of the 1964–5 lectures. Readers interested in the developmental course of Sacks' lectures may wish to juxtapose these two treatments, separated by some seven years of intense intellectual work. It is not only that the same data are involved which might inform such a juxtaposition, but that themes reappear in the Spring 1971 lectures which have not come up in the preceding several years. To cite but one example, there is Sacks' discussion (May 21, pp. 405ff.) of the characterization of someone as a "stranger," a discussion which goes back to the issue of categorization (though not in that technical terminology) taken up in detail in the paper "The search for help: no one to turn to" which was being written just before and during the first of these academic terms of lectures.

Although the first lecture as delivered did include some initial discussion of a data fragment,[20] it was largely given over to the stance which Sacks was taking up with respect to his audience – both those present in the room and those interested from afar (including, therefore, the present readership). It is a rather franker statement than most instructors would give of the auspices under which they address an undergraduate class. And it reverses the relationship which might have been assumed to hold between the students sitting in the room and those far away – in place or time – who might be interested in "the work." Rather than the latter being incidental and "by-product" recipients of materials designed for the undergraduates, it is the undergraduates who are recast as almost incidental onlookers to, and overhearers of, this analytic undertaking.

"Almost;" for there is evidence throughout these lectures that the relevance of the co-present audience did in fact enter into the shaping of the issues and the manner of their presentation. There is, for example, the initial substantive discussion.[21] Sacks explores some ways in which speakers find or select words

---

[20]Cf. April 5 lecture, n. 1.

[21]As in the case of several previous consecutive terms of teaching, Sacks begins the substance of the lecture set in the second of the consecutive terms with what he was exploring less systematically in the preceding term. (See, for example, Winter and Spring 1970 on storytelling in conversation.)

Note that parts of the text here have been rearranged for the sake of continuity and coherence, so that some of the material included here with the lecture of April 5 was actually part of the introductory lecture.

for use. In particular, he focusses on their doing so in "a history-sensitive" manner, for example, by reference to the sound or (later on, in the lecture for May 17) the metaphor composition of the prior talk. The tenor of the discussion is instructive.

There are aspects of this discussion which suggest that, the stance taken in the first lecture notwithstanding, Sacks did not entirely ignore the nature of his co-present audience. The upshot which he takes from the discussion of sound-patterning (lecture for April 5, pp. 341–4) is (p. 343):

> for now . . . just to get some idea of how closely attentive in some fashion people are to each other, where picking up the sounds, doing simple contrasts, etc., are ways that they may be doing being attentive to each other.

And again (p. 344):

> when we begin to collect the sorts of things that I'm noting here, we can feel that a serious attention to the way the talk is put together might pay. These sorts of things at least suggest some sort of close development.

And again, at the end of that lecture (in the present edition), after a discussion of strategic considerations relevant to the parties in the talk in the group therapy session materials (p. 347):

> And that paralleling of the attention to a distinctive weakness can suggest that they are moving with a kind of close attention to each other in a conflictive way.

Two things may be said about the drawing of such conclusions. On the one hand, they are in point for hearers with no previous exposure to conversational materials and to this kind of close analysis of them. They seek to warrant the kind of attention being paid to these materials in a way that would not appear to be directed to an audience interested from afar in what Sacks has to say. On the other hand, it was a task to which Sacks recurrently addressed himself – to warrant these materials as respectable objects of study, and to establish over and over again, in a variety of respects, that these materials were orderly at quite refined levels of organizational detail. It is as if he were forever justifying – to others and to himself – the undertaking, its starting point, and its key premises. The upshots drawn here, early in the Spring term of 1971, can then be understood to be addressed not only, or not especially, to the students in the room, but to any recipients of his discussion.

There are two matters taken up in the Spring 1971 lectures which have a history, either prior or subsequent, which it may be useful to call to attention – the relevant identities of conversational participants, and the notion of "preference."

In the lecture for April 19, Sacks begins a discussion of "caller–called" by reference to the possibility that

> some part of a sequential organization of conversation has to do with *identities that the conversation itself makes relevant*, such that for at least those facets of the conversation one needn't make reference to other sorts of identities that parties have which are, so to speak, exterior to not simply the conversation, but to its sequential organization. If, however, we found that such other identities were central to almost anything one could say about a conversation, then there would be a way in which conversation could not be said to have an organization independent from such other aspects of the world as yielded other identities, e.g.; the names, sexes, social statuses, etc., of the parties. You could imagine a world where some social status the parties had, operated in such a way as to determine how they could talk to each other, and in that world conversation would not be an independently organized phenomenon.

The issue of the relevant formulation of the identities of participants comes up recurrently throughout Sacks lectures. In the Spring 1967 lectures, it may be recalled, there was a discussion of the possible "omnirelevance" of the category-set "therapist–patient" for the group therapy session materials – those categories straddling the line between "exterior" and conversation-specific.

Elsewhere, in the lectures of Fall 1967 (and even more centrally in early lectures for Spring 1967, not included in this edition) Sacks launched a discussion of turn-taking by considering a claim in a paper by the anthropologist Ethel Albert (1964) about the practices of the Burundi. In this account, members of that society are all hierarchically ordered, and the society is small enough that on any occasion everyone present can assess their place relative to everyone else present. The distribution of opportunities to talk is organized by reference to this hierarchical ordering,[22] with the highest ranking person speaking first, then the next, etc., until each has had an opportunity to speak in an initial round; subsequent rounds reproduce this ordering.

Leaving aside a variety of problems which can be expected in a system which worked in this way (and problems with the description), this account embodies what Sacks has in mind by "a world where some social status the parties had operated in such a way as to determine how they could talk to each other, and in that world conversation would not be an independently organized phenomenon."

The point is that, if one could show for *some culture/society* that there is an order or domain of conversation which is relatively autonomous of interactionally extrinsic attributes, then the *possibility* of such a culture would have been shown. Although it might be claimed *in principle* that there were other

[22]As Albert put it (pp. 40–1), "The order in which individuals speak in a group is strictly determined by seniority of rank."

cultures where there was no such autonomous form, there would then be certain burdens and opportunities of demonstration and exploration that would have to be addressed. For one, it would have to be shown that there was an empirical instance of such a society/culture, rather than simply be asserted in the nature of the case. For another, it would be a feature of a society/culture which might then be explored for what else it was related to, how it came to be so, how it was embodied or implemented, etc.

This discussion, then, is intimately related to the issue of the omni-relevance of gender or class status, etc. (class and gender are singled out here because they are the features most often invoked as specially constraining and shaping the conduct of talk in interaction). For to show a relatively autonomous order of organization (or several such orders) for conversation would be to establish domains of interaction not necessarily contingent on gender, class, etc., and thereby to show conversation to be "an independently organized phenomenon."

One significance of the categorical identities "caller–called" is that they are conversation-specific (unequivocally so, unlike "therapist–patient"), and it appears that they serve as the feature by reference to which various aspects of talk are organized, especially with respect to the overall structural organization of single conversations. This had been shown in Schegloff (1967, 1968) for the organization of openings, e.g., with respect to who talks first. Part of Sacks' argument here turns on the relevance of caller/called not only for openings, but for "closings," for example, it being the caller's business to initiate arrangement-making and other ways of getting to the end.

It is striking that in a prior discussion of omni-relevance (in Volume 1, Spring 1967, lecture 14, and cf. the introduction to Volume 1, pp. liii–liv), Sacks argued for the omni-relevance of "therapist–patient" in the group therapy sessions by reference to its being the therapist's business – in *that* capacity – to bring the session to a close, and that a new patient has to be told that an "indirect" closing initiation by the therapist was doing that job, something which he did not himself see and which it would not have been doing had anyone else said it. The relationship of some identity to a bearing on "closing" (at least of a conversation as a whole) may, then, turn out to be of strategic importance in showing category omni-relevance.

The issue of the relative autonomy of conversation/interaction has had a continuing relevance for students of interaction. Perhaps the most prominent discussion of the issue within contemporary sociology was Erving Goffman's presidential address to the American Sociological Association, 'The interaction order' (Goffman, 1983) which also argued (albeit along different lines) for the relative autonomy of the organization of interaction from other aspects of social organization.

Another topic with a considerable later development figures in these lectures for Spring 1971. At the end of the lecture for May 24 (pp. 414–15) there is a discussion (the first of which there is a record, though Sacks refers to an earlier related lecture) of the asymmetry of "yes" and "no" answers – related to the form which a preceding "yes/no" question has taken. This is

an early form of what would eventually become, under the name "the preference for agreement" (cf. Sacks, 1987 [1973]), a much more general account. Here Sacks appears to focus on such questions as might be termed "pre"s, even if the future course of talk – the type of sequence – which the speaker meant to undertake is not at all clearly projected. Whereas the discussion in the May 24 lecture is quite specifically situated, and refers to courses of action in which some sort of sequence may figure as preparation or "setup," Sacks would two years later, in the public lecture at the Linguistic institute in Ann Arbor on which the 1987 publication is based, depict the preference for agreement as a much more general – structural – feature of question/answer sequences of the "yes/no" type, with still more general implications, for example, for adjacency pairs.

   A key component of this notion is that of "preference," and it has a longer (and variably focussed) history in Sacks' *oeuvre*. In these lectures, for example, in the lecture for April 23, Sacks proposes that some formulations of the event for which an invitation is being tendered are "preferred:" if the occasion is to include dinner, for instance, the invitation should be for "dinner;" anything else (e.g., "drinks") and recipients will hear that it is "not for dinner," for, given its "preferred" status as an invitation form, it would have been used if it could have been used. And two years later at the Linguistic Institute, where the "sequentialized" version of "preference" was extended from the usage here to that of 'On the preferences for agreement and contiguity. . . ,' the application of the notion "preference" to "formulations" was extended from formulations-of-events to reference-to-persons in the drafting of the paper 'Two preferences in the organization of reference to persons in conversation and their interaction' (eventually published as Sacks and Schegloff, 1979).

   And before the usages here in the Spring 1971 lectures, a similar notion underlies the conception of 'specific alternatives" (cf. Schegloff and Sacks, 1973: 305, 313–14; this paper was first drafted during the summer of 1969). There the notion of "specific alternatives" made relevant by an utterance such as a "possible pre-closing" was explicated by noting (p. 314) that

> the alternatives made relevant by an utterance of that form are not symmetrical. Closing is the central possibility, further talk is alternative to it; the reverse is not the case. . .

That feature of asymmetry – later central to the notion "preference" – came up in other working sessions of 1969 and 1970. For example, I recall Sacks remarking on it while examining tapes made by Melvin Pollner in a Southern California traffic court; the observations concerned the treatment by the parties involved of the source of income of a college student appearing before the judge; Sacks took it that some sorts of financial support (I do not now recall which) were central and "normative" (in the sociological terms of the time), and others were alternatives to them, but not vice versa.

The contrast figures, in essentially these terms, in lecture 6 for Fall 1971, at pp. 455–6, where Sacks is discussing a story told by a teenage girl to a teenage boy, a story which turns centrally on her spending half the night with a "guy that [she] liked a real lot." What is central to the telling of the story is that they spent the time "in the back house" (i.e., the house behind the main house, a sort of guest house) instead of "in a car." Sacks shows how "in the car" is built into the story as "normal" for teenagers, something with which the teller is trying to fashion a contrast. "In the back house" is then a specific alternative; it is an alternative to "parking" or "in the car," but the latter is not "an alternative;" it is the basic, unmarked (as linguists might put it) place. And in that same context Sacks introduces the use of the term "preference:"

> . . .She can. . .invoke the normal priorities, in which, for unmarried teenagers, parking is '*preferred*.' I don't mean that it's favorite, but there's some way it's preferred over the back house, if at least only in moral terms. That is to say, she brings off that *she* prefers the back house, but there is *a more abstract sense of 'prefer' which involves her in invoking the parking – that which is 'preferred' in the more abstract sense – as a first alternative*" [final emphasis supplied]

It is this sense of "preference," as "a *first* alternative, to which others may contrast but which itself does not contrast with them" which is one central thrust of subsequent uses of the term, both by Sacks and by most others[23]

VIII

Although the particular phenomena and data sources taken up in the lectures for Fall 1971 are quite different, the thematic commitment underlying this course is strikingly reminiscent of the lectures for Spring 1966. In both may be found explorations of how (a) culture is to be conceived which blend a fresh theoretical conception with a distinctive and organic relationship to "ordinary" conversational data.

One relevant bit of background for the first lecture of the term may well be an episode in law school (earlier recounted in the introduction to Volume 1, n. 6) which alerted Sacks to the mysteries of commonsense assessments of the plausibility and seriousness of conjectured events. Law students debating a point in the law of torts rejected as implausible the premise of an airplane flying at an altitude of five feet while willingly discussing hypotheticals only

---

[23]This includes, for example, Schegloff, Jefferson and Sacks, 1977. The notion captured by "preference" figured in my own work at the time as well (especially in Schegloff, 1970), but not under any of these names. For further discussion, cf. Schegloff, 1988, and, for another view, Bilmes, 1988. For applications, discussions and reviews of the notion of "preference" (and "dispreference") cf. among others Atkinson and Drew, 1979: chapter 2; Heritage, 1984: 265–80; Levinson, 1983: 332–45; Pomerantz, 1978, 1984.

marginally larger. The concerns then awakened, which had driven the insistence on actual observation and then recorded and re-examinable data, may have served tacitly as the grounds for the line developed at the start of lecture 1 on the trouble of dealing with imagined occurences, and the impossibility of dealing with events that strain commonsense credibility, events which otherwise can be shown to be real.

This theme reappears explicitly later in the Fall 1971 lectures, in Lectures 9–12 "On some technical considerations of a dirty joke."[24] There Sacks points to a staggering number of implausible co-occurances on which the story/dirty joke being examined depends, and without which it collapses. And he addresses himself especially in lecture 10 to the devices by which the telling of the joke/story can survive these apparent implausibilities. He rejects an "Aristotelian" solution along the lines of a generic "suspension of disbelief" by noting that no disbelief arises to be suspended, and that the story could not survive if it did. He suggests instead that a recipient is fully engaged in understanding the story, and that the artfulness of the story in deploying the elements from which an understanding can be achieved channels attention in a fashion which circumvents the implausibility by naturalizing and sequentializing the events.

Still, the isolation of this problem and the treatment of the narrative form by ironic comparison to a quasi-realistic story suggests a continuing underlying preoccupation on Sacks' part with the relationship between the real and the unreal, the plausible and the implausible, the real and the plausible, the real and the implausible, etc. And here again (as in the Spring 1966 lectures; cf. introduction to Volume 1, pp. xxxix-xli) may be found echoes of the "commentator machine" introduced in Sacks' early (1963) paper 'Sociological description,' with its metaphorically articulated depiction of various possible relationships between real doings and the accounts offered of them, and the account-offering as itself a real doing relative to which another doing may be a defective exemplar.

Lecture 1 begins an announced preoccupation with "storytelling in conversation" with an observation about a pun, and the first several lectures are as much about puns and proverbs as they are about storytelling.

Sacks' concern with puns, which would eventually issue in a presentation at the Georgetown Roundtable in March, 1972 and the little paper (Sacks, 1973) 'On some puns, with some intimations,' is analytically located at the intersection of problems of word-selection of a "poetics"–like character on the one hand, and the practices of storytelling sequences on the other. His discussion of puns here in lecture 1 as well as in the Georgetown Roundtable paper is focussed on their use[25] by a story-recipient just after story completion. The occurrence of puns – unintended and unheard puns – in this distinctive sequential position may have recommended itself to Sacks as a case in point

---

[24]These lectures were published under that name, as edited by Gail Jefferson, cf. Schenkein, 1978.
[25]And the use of proverbs; cf. the ensuing discussion below.

for the contrast between "implausible 'real things'" and imagined things one could get someone to believe as a basis for theorizing about them. Or perhaps the order was just the opposite; entertaining the possibility of opening the lecture and the course with a discussion on puns, some groundwork seemed called for, addressed discursively to the believability of the sort of thing he was going to begin with.

The discussion of proverbs (at lecture 1, p. 422) goes back to Sacks' reaction while still a graduate student at Berkeley to the beginning of George Homans' book, *Social Behavior: Its Elementary Forms* (1961). There (pp. 1–2) Homans remarks in passing on the traditional folk sociology which (it was apparently his view) it was scientific sociology's business and mandate to correct and supplant. The hallmark of this folk knowledge was for Homans apotheosized by proverbs with their "obvious" truths, but also directly contradictory truths.

This theme was by no means unique to Homans. Both Homans and the many others who contrasted scientific sociology with common knowledge were engaged in defending sociology as an academic discipline from charges that it was "nothing but common sense." Many took it that one line of defense was to show the weaknesses of commonsense knowledge, and thus the proper office of sociology in reference to it. That office was to replace "common sense" with something more scientific. This was, of course, one central point of reference for Garfinkel's observation (1967: chapter 1) that the social sciences were addressed endlessly to the substitution of "objective" for "indexical" assertions, and the alternative ethnomethodological program which he put forward – to make commonsense knowledge non-competitively a *topic* of sociological inquiry.

Sacks was struck early on (that would have been in the very early 1960s, most likely in 1962–3, while we were at Berkeley's Center for the Study of Law and Society; cf. introduction to Volume 1, p. xv) by Homans' non-analytical, non-sociological stance toward proverbs – treating them as primitive and faulted versions of scientific propositions. The issue for Sacks was, precisely, what *were* proverbs (as natural objects, so to speak), and what were they used to do, that might make the features which Homans treated ironically seriously understandable. He sought out a relevant literature and found Archer Taylor's *The Proverb*, but did not find the answer there, though he respected it as a work of scholarship.

It is striking then to read Sacks' treatment here (at lecture 1, p. 422) with this history in mind. Briefly, in the context of a discussion of the use of proverbs by story recipients on story completion, and having remarked on the common observation of the inconsistency between different proverbs, he asks,

> Now the question is, is that a defect of proverbial expressions? Or is it that, if it turns out that what proverbial expressions do is that they are used to understand something else, then the question for them is, are they applied to something that they evince an understanding of? If so,

it's quite irrelevant that, as a package, they can turn out to have an inconsistency among them. The problem is not, on any given one's use, is it true relative to other proverbial expressions, but, does it, as something one understands with, understand what it applies to? Where, what it applies to is the story it's used after. . .

. . .What's done with them is to take one and see how, for what it's positioned after, does it understand that. It can then be seen as irrelevant, somewhat arbitrary, to say "Let's take the set of them and consider whether they're consistent, to determine whether they're true." That may be not at all how, empirically, they work.

Here, some ten years later, is Sacks' answer to Homans — his contrasting account of how proverbs should be treated by sociologists. And in this little passage is the direct confrontation of the effort to treat proverbs as defective propositions — failures as "objective" expressions — with the claim that they are designed fundamentally as objects for *indexical* deployment. They are meant specifically to display understanding of the local object they are placed after — they are prototypically indexical in that sense. Each is to be juxtaposed to its occasion of use, for which it was employed; that specifically renders problematic the detachment of each from the environment for which it was produced, for juxtaposition with other such disengaged-from-context objects. And Homans' critique of them — based on just such a disengagement — is the apotheosis of the social science practices to which Garfinkel meant to set ethnomethodology in "non-ironic" contrast. For Sacks, this analysis grew directly from his effort to figure out how proverbs worked.

IX

Those familiar with the published corpus of conversation-analytic work will recognize in lecture 5 a version of the 'Two preferences. . .' paper (Sacks and Schegloff, 1979). I do not recall at what point Sacks and I found ourselves both focussing on the contrast between what Sacks here terms "Type 1" and "Type 2" identifications of persons and what I was calling (with no restriction to the description of persons) "description-for-recognition" and "description-for-understanding." The written version of the paper was initially drafted by Sacks while we were living in the same house during the Linguistic Institute at the University of Michigan in 1973. I did not know he was drafting it, until he gave it to me early one evening to look over. Although we worked over it intermittently, the changes made from the initial draft were relatively small and technical.

The discussion of forms of reference in lecture 5 (as well as the paper which followed) can be located in another course of development. While still at UCLA (probably about 1966) Sacks had drafted a paper which came to be referred to as the "two-person identification" paper. The data fragment which had given rise to the "two-person identification" line of analysis, and around

which the paper was written, was taken from the observational materials collected by Barker and Wright.[26] In this episode, a little girl enters the kitchen of her home and finds her mother talking to another woman, someone the little girl does not know. The following exchange is then reported:

Little girl : Who is she?
Mother : That's Rita. Do you remember the other day when you went to the party and met Una? Well that's Una's mother.

This data fragment was appreciated against the following analytical background.

Sacks had established in his dissertation work (cf. the published version in Sacks, 1972a) that there was no general solution to what he termed "the one-person identification problem." That is, faced with the task of identifying/categorizing a single person, there were demonstrably available multiple "membership categorization devices" which contained some category which could properly categorize any person.[27] And there did not appear to be any general solution for selecting which device to use – no general preference rule that would select some device from among whose categories "the correct one" for the person being categorized should be selected. This was a finding with many analytic and theoretic reverberations. For example, analytically, any actually employed categorization employed by a speaker in talk-in-interation had then to be viewed as a contingent product whose achievement could be subjected to analysis by reference to the particulars of its local environment. (And, theoretically, social scientists' categorizations could not be warranted solely on the basis of their descriptive correctness, but had to be otherwise warranted, e.g., by reference to their relevance, whatever grounds of relevance might be chosen.)

What the data fragment reproduced above suggested to Sacks was that, whereas there seemed to be no general solution to the *one*-person indentification problem, there might be a solution to a *two*-person identification problem. In his dissertation (1972a), he had described what he proposed to be a categorization device composed of *pairs* of linked terms – "paired relational categories" he called them – (e.g., friend–friend, husband–wife, relative–relative, parent–child, neighbor–neighbor, stranger–stranger, etc.), which constituted ". . .a locus for a set of rights and obligations. . ." (p. 37). This categorization device was used to categorize a population of persons not one at a time, but two at a time – as incumbents of one of these paired

---

[26]Although Sacks had worked on some observational materials which Barker and Wright had published (for example, *One Boy's Day*, 1951), I believe the fragment involved in the "two-person identification" paper was taken from other, unpublished, material of theirs which Sacks had secured.

[27]Sacks had termed these devices "Pn-adequate," i.e., adequate for any, unspecified (hence "n") population (hence "P"). The devices/collections of "age" and "sex/gender" categories were his most commonly invoked instances.

relational categories. It appeared as well that there was only one such categorization device, only one which identified/categorized persons two at a time.

What the "Rita/Una's mother" data fragment suggested was that one way members might handle a one-person identification problem which had no general solution was to transform it into a two-person identification problem which *did* have a general solution. In the instance at hand, the little girl's mother adopts this solution: asked to identify one person ("Who is she?"), she introduces another person into the identification problem – Una – and then identifies the pair of persons by a set of paired relational categories: mother–[child] (". . .That's Una's mother"). This was an extremely elegant solution to the identification problem, and an extremely elegant account of it.

But there were problems, and on a visit to the west coast during the winter break Sacks and I discussed them at length, as we regularly did with one another's written work. The most telling – and ultimately fatal – problem was that this solution did not work as a general solution. For one thing, not all the paired sets of terms could be (or were actually) used by interactants; for example, although "stranger–stranger" was one of the paired term-sets (and one indispensable for the empirical context which first gave rise to the formulation of this categorization device), persons confronted with an identification problem do not respond by saying, "That's Rita. Remember Una? Una and Rita are strangers." Were stranger–stranger an eligible category-set for these purposes, there might be a general solution to the one-person problem by converting it into a two-person problem. Without it, it was not a general solution.

Another problem, equally fatal and with clear connections to the lecture which prompts this discussion (and to the 'Two preferences. . .' paper), was that not any person could be introduced as the second for co-categorization with the initial person to be identified, and not even any person in a specified range of relationships to the target problem. Only such persons could be introduced (or seemed actually to be introduced) as were expectably recognizable to the one posing the problem, the one for whom the categorization was being done. So again, persons confronted with an identification problem do not say "That's Rita; there's a little girl named Una, and Rita is Una's mother." There was, then, not only a constraint on which set of paired terms could be used for the target person and the one to be introduced as second; there were restrictions on which second person could be introduced for this purpose by reference to the knowledge of the recipient of the identification. Indeed, the possibility could not be ruled out that no second person could be found who would satisfy both containts (nor was it clear that these were the only constraints). The status of this categorization device as a general solution to a *two*-person identification problem was thus cast into doubt, let alone its status as second-order solution to the one-person identification problem. The "two-person identification" paper was shelved. But it was not without consequences, of which brief mention can be made here of only three.

First, the data fragment which motivated that earlier effort has here, in the Fall 1971 lectures (lecture 5, pp. 451–2) become an example of

> where a speaker doesn't figure that recipient knows who's being referred to, but knows something that involves it in being an 'almost,' i.e., that you know someone in some close relationship to that one being referred to.

Its bearing thus is incorporated into the discussion of "recognitional reference" and the preference for recognitional reference even when the possibility of its achievement is open to question (cf. Sacks and Schegloff, 1979).

Second, it seems to be relevant in a curious way to a tack taken in an earlier lecture, and on quite a different topic – lecture 6 for Fall 1968. A bit into that lecture (at p. 70), Sacks is discussing introductions (of one person to another), what occasions them and how they're done.

> One way to think about it is to consider that a way to simplify the task of doing any introduction would be, e.g., to constrain the occasions under which introductions could get done. You could say, for example, introductions should go 'first name to first name.' That can operate to constrain the initial use of an introduction to only people you can introduce that way.

But, Sacks points out, that runs up against the fact that the conversations within which introductions have to get made are generated by an entirely separate mechanism from the one that makes introductions possibly relevant.

The relationship to the problems with the "two-person identification" paper is this: one problem with that paper, as just recounted, was that the mechanism only worked for certain possible values of paired relational category terms (not for e.g., stranger–stranger), and setting such a pre-specification subverted the potential generality of the device. So here as well, where the point is that an introduction mechanism is needed which will have *as* general a scope as whatever occasions the relevance of an introduction and whatever occasions the already-ongoing conversation within which introductions come to be relevant. Pre-constraining introductions to certain values of introduction terms would subvert the viability of that institution. This is just another specification of the more general result that pre-constraining the elements of a device which can be employed subverts the possible use of the device as a general solution to some problem in the practices of interaction.

Third, the working through of the problems of the "two-person identification" paper seems to have deeply affected Sacks' thinking about the relative merits of single case analysis versus the use of aggregates of data *for the purposes of building a discipline*. Note that the issue is *not* the status of single case analysis per se, but the possibility of building the sort of desired *discipline* which had come to be the goal of conversation-analytic work. In a letter to me

a few years later (March, 1974), Sacks remarked on the relevance of "working with masses of data" as what "in the end differentiates what we do from e.g. French structuralism." And, in this regard, he invoked the experience of the problems with the "two-person identification" paper – and its effort to ground a general solution in a single case – as evidence enough.[28]

X

Having initially projected the Fall 1971 lectures to be about stories and storytelling, the first six lectures depart somewhat from a close focus on that topic, although remaining at least tangentially relevant with lectures 7 and 8, and then with the series of lectures from 9 through 12, Sacks comes back squarely to his announced topic.

Lectures 7 and 8 address the "motive power of stories." The theme is a penetrating and remarkable account of a particular class of stories. These are stories which come to be *re*told after a long time delay ("long" here meaning years), a delay during which one who had been the recipient of the story becomes the kind of person the teller then was, and tells it in turn to a recipient such as he was when he was told it – the retelling being done on just the sort of occasion which is appropriately analyzed by the story. Such a "delayed-fuse" story thus serves as a kind of cultural repository for occasion-ally relevant knowledge. (The material being analyzed involves an older man, seeable as "no longer having prospects," telling a younger man, who is about to depart for college – and prospects – about the time *he* was a young man, with prospects, and what became of them.)

These lectures call to mind the lectures of Spring 1966, for the way in which they speak to the nature of culture, the ways in which culture mobilizes minds as a repository of what it has to transmit, and uses stories as the vehicle for transmitting that knowledge, recruiting the interactional stances of the participants in the situations in which they find themselves – for which the stories provide analyses – as the energy driving the telling of the stories as matters of e.g., self-justification. They also recall lecture 5 of Spring 1970 on how memory for experiences can be motivated by having them stored as "the property" of the one to remember them, to be accessed by others by telling a "similar" story.

The theme plays off a by-now clichéd geneticist "witticism" that chickens are the device by which eggs reproduce themselves. Here persons, their experiences, and the stored versions of experiences in stories are the device by which culture reproduces itself and adapts to changing social circumstances. The line taken here is reminiscent of a term (though not necessarily the

---

[28]He wrote, "The 'structures for particulars' direction [which is how Sacks had earlier characterized "the thrust of my stuff over the years"] doesn't work: recall the two-person paper failures, etc. and the 'system for masses,' for routine, etc. may." (The internal quotation marks have been added for clarity.)

correlative meaning) which the anthropologist Alfred Kroeber introduced some years ago for culture – "the superorganic."[29]

These resonances of lectures 7 and 8 are sustained in the following four lectures, 9 through 12, on the dirty joke as a technical object. In this discussion as well, the story form is treated as a packaging device for elements of culture, as was the case in lectures 7 and 8. There is a distinct shift in theme here, focussing less on the teller doing things via the story and more on the story doing things through the teller, and doing them through the teller as the instrument of a culture. The story in general, and the dirty joke as a technical object in particular, get worked up somewhat formally here in a fashion parallel to the account of games (and children's games in particular) as packaging units for a culture in the Spring 1966 lectures.

This is a weighty theme and it may be appropriate to understand Sacks to have prepared his audience for it in the opening lectures for the term. Recall that in the first lecture in this set for Spring 1971 Sacks had tried to provide grounds for taking seriously the possibility that there really was a pun in the story, that it was not just a "reading-in" by the analyst, just as he had done in other first lectures, to ground the seriousness of word-selectional or "poetics" observations. Here he proceeds in the same fashion by showing the "artfulness" of the dirty joke/story, the elaborate way it is put together in order to ground a claim for its status as a technical object, and eventually his claim for it as a serious transmitter of culture.

It is in lecture 11 that the theme of the dirty joke as a packaging device for culture, with its "dirtyness' serving as a form of restriction on its circulation, is stated most pointedly. It may be worth mentioning here again (cf. introduction to Volume 1, p. xxii) the relevance of the work of classical scholars such as Milman Parry, Albert Lord, and Eric Havelock, all of whose work Sacks was familiar with, and from whom he would have become familiar with the notion that the classic forms of oral cultures – such as the Greek epic – served as major instruments for the preservation and transmission of a culture, the story line of the epic being not so much the point of it as the shaper and guarantor of its transmission. It was just one aspect of the special métier of Sacks' mind and sensibility to see in this juvenile "dirty joke" told in a teenagers' group therapy session the contemporary operation of so grand a theme, otherwise treated as the special preserve of élite "culture."

Another echo of the Spring 1966 lectures in Fall 1971 is the appearance of a concern with children, and children's learning the ways of the culture and its rules, a theme which is central here in lecture 12. This lecture again calls to attention Sacks' extraordinary capacity to take apparently general views and characterizations of the world, ones which present themselves as "natural" accounts of it, and to specify them, often showing them to embody some distinct and limited perspective. Thus in lecture 12 he depicts what seems to be a potentially anybody's recounting of a scene as specifically embodying the perspective of 12-year-old girls. In the earlier lectures 7 and

[29]Cf. Kroeber, 1917.

8 for Fall 1971, he shows how a story embodies in particular the perspective of persons with live prospects for a future or those with already failed prospects. And in an earlier set of lectures (Winter 1970, lecture 2) he takes what appears to be a passing observer's "bland" general account of a scene in which "the police were handling some trouble at a department store" and shows that to other eyes – of members of different social groups with a different experience with authority – what might be seen might be not that there was trouble and the police came and handled it, but that the police came and there was trouble and it was unclear how it was being handled, how it would turn out, and how it would turn out to implicate them.

   Although seemingly quite remote from that tradition of analysis, these are exemplary exercises in the sociology of knowledge. Apparently unsituated views and understandings of the world and of particular settings – otherwise understandable as just "how things are/were" – are analyzed for the distinctive social groups to which they are affiliated, and with whose experience of the world they link up. These discussions illuminate our understanding both of the particular settings and utterances being addressed, and of the distinctive experience of social circles to which we gain access by way of these discursive practices.

   In this regard, it is striking that one of Sacks' characteizations of the special perspective of 12-year-old girls by reference to which the dirty joke being examined in lectures 9–12 should be understood is reminiscent of his depiction of the perspective of suicidal persons who see themselves (and report themselves) as having "no one to turn to." That phrase supplied the subtitle of Sacks' major early paper (and his dissertation), *The Search for Help: no one to turn to*. Now remembered primarily for its formal statement of the categorization problem and aspects of its solution, it may be useful to recall that, although textually at the beginning of that work, developmentally it was subsequent to the initiating problem, which was how someone might come to say "I have no one to turn to," and say it seriously (that is, as the reported result of a search procedure), delivered paradoxically precisely in an occasion in which it seems apparent that they have found "someone to turn to." Sacks *began* with that, although in the paper he *ends* with it.

   The proximate solution of "no one to turn to," Sacks proposed, was that the person involved (the suicidal person, that is) had such a problem as would alienate precisely the person(s) whom the normative search procedure would locate as the proper persons to turn to. That is, there are in general "persons to turn to" (formulated by reference to paired relational terms discussed above at pp. xxxvii), but the problem involved, if reported to those persons, might lead to their abandonment of just the status which made them the one(s) to turn to. Thus, for example, turning to a spouse with a problem engendered by one's adulterous involvement.

   What is striking is the formal similarity to this situation of the putative circumstances of 12-year-old girls in Sacks' account of the dirty joke: namely, the problem of checking out information about sex, information acquired illicitly, e.g., by listening in to the parent's bedroom from behind a door: with

whom can such supposition be checked? the parents one spied on? the friends to whom one cannot reveal just this inexperience? The formal similarity is striking: the nature of the problem is what precludes turning to just the ones one would otherwise turn to for its solution.

The last lecture for Fall 1971 is about dreams, and seems quite disengaged from the other lectures. In fact, Sacks developed a considerable interest in dreams (among other respects as a format in which stories are preserved), and pursued it, largely informally, during these years. In part, this had developed from his reading in Freud and in a variety of literary sources; in part it converged with an interest in popular culture (an interest which, in the last several years before his death, included such matters as advertising as well.) He was, for example, interested in the presentational modality of dreams – whether they were experienced as being read or being seen in action; if seen, like a movie, whether they were in color or black and white; what sorts of editing and directorial techniques informed their structure, and the like.

XI

The lectures for Spring 1972 begin in the same fashion as did those for Fall 1968, as a systematic and general account of an organization or a class of conversational occurrences – in this case, adjacency pairs and adjacency pair organization. It is not until the second half of the second lecture that a determinate, actual (as compared to intendedly exemplary or "characteristic") bit of talk is presented for careful and detailed examination. But the text of the first lecture and a half nonetheless makes clear that this general and systematic introduction to the projected subject-matter for the course is based in a detailed way on a substantial corpus of observations and analyses of particular stretches of talk of which adjacency pair organization is to be offered as a tentative account (though hardly preparing us for the illuminating detail exposed when the first bit of data is examined closely in the second half of the second lecture).

The general features of adjacency pairs are first introduced via a variety of particular sequence types – greetings, terminal exchanges, question–answer sequences, etc. – each of which names its own, recognizable class of sequences. Adjacency pairs are thus introduced as a class of classes. But the particular variety of sequence types is strategically selected to display something of the extraordinary provenance of adjacency pairs – used at the critical junctures of virtually all the main kinds of organization of conversation: at the opening and closing boundaries of particular episodes of conversation, as the central device by which next speakers are selected, as the basic tool for remedying various locally occuring problems in conversation, as the locus for departures from a single-sentence format for utterances (sub-sentential utterances characteristically being second-pair parts, and the construction of multi-sentence

utterances being mediated on this account by adjacency pair constructions), and so forth.

This introductory account of the generality of adjacency pairs by reference to the other types of organization in which they figure prominently and strategically is followed by another, an account of their provenance by reference to their distributional generality. That is, if we ask where adjacency pairs can go (and, in particular, where their first pair parts can go, since where the second pair parts go is given by the first pair parts, i.e., after them), we find that their privilege of occurence is unrestricted except by reference to adjacency pair organization. That is, they can go anywhere except after a first pair part, unless the one going "after" is initiating an "insertion sequence." The point here is two-fold: our sense of the centrality of adjacency pair organization is reinforced by its virtually unrestricted distribution, and our sense of its basicness is reinforced by its self-organizing character, that is, by the observation that the only restriction on its distribution is that imposed by adjacency pair organization itself. (Recall that a similar argument had been offered for the basicness of the turn-taking organization in Fall 1968, lecture 4, pp. 54–5, and this introduction, above, p. xvi and n. 12).

When Sacks turns to the examination of a specimen of an adjacency pair, the focus shifts sharply. The exchange – a question/answer sequence – occurs in

> a telephone conversation between two middle-aged women one of whom has gone back to college part-time, and is telling the other about a class she's taking

The other – Emma – asks:

> *Emma* :   Are you the oldest one in the class?
> *Bernice* :   Oh, by far.

In some five pages, Sacks shows an array of issues to be involved which most readers, I suspect, will not have anticipated. Here I want to draw out one of them, one which echoes themes raised in earlier lecture sets, especially that for Spring 1966 (and see the introduction to Volume 1, pp. xxxvii–xxxix). The issue concerns the proper understanding of the positioning of the subject-matter of these lectures – and of the area of inquiry which has developed with the name "conversation analysis" – among the disciplines.

One of Sacks' early observations about this exchange is that the question is not characterizing Bernice's position in the class as one of a possible set of positions, others of which might be "second oldest," or "one of the oldest," and the answer is not just a way of saying "yes," or saying it emphatically. Rather, Sacks proposes with respect to the former, the question is asking about a "unique position" in the class, with a variety of features which can go with occupying a unique position ("being the only X"); in that respect, its relevant alternatives are not the set of age-grade positions, but things like

"Are you the only woman? Disabled person? African American?" etc. Sacks continues (lecture 2, p. 538),

> So that what seems like a kind of obvious semantics turns out to be wrong for our language. It's one you hear around, and it says: Take "the oldest one in the class" and find its meaning by considering the set of alternatives to it, where the alternatives can easily be derived from it by just considering some obvious way in which it is part of a set of positions having to do with 'oldness.' . . . Now, *alternatives* are an obvious way to go about locating what something is doing or what something means. But the question of alternatives does not have an easy answer. It is, for any given thing, an empirical issue and not simply a transparent semantic issue to be gotten by lexical considerations. In saying what I figure to be the kinds of things that are alternatives here, both in the question and in the answer, I'm saying something that *has to be discovered from a consideration of the way the world works* that produces these kinds of sequences. This obviously produces a massively complex set of problems in analyzing things like a small question–answer sequence. For each one of them, if we're going to use alternatives to find out what it means, then we're going to have to go into a discovery of what the alternatives are. [Second emphasis supplied]

The point to which I wish to call attention is that this is not a matter of *linguistic* analysis in the usual sense; the closest might be some form of anthropological linguistics or linguistic anthropology, though those disciplines have shown qualified enthusiasm at best for this sort of analysis. The point here echoes a point like the one made in the Spring 1966 lectures apropos of "possessive pronouns;" they work linguistically as possessives only given an independent analysis of what they are affiliated to as "possessable" (hence the very different senses of "my shoes" and "my barber"). And the latter are not linguistic facts.[30]

But more is involved than there simply being a separate domain to be studied here, and therefore possibly a different discipline. When he turns to Bernice's answer, Sacks notes that it says "The question you asked me is correct. I am what you're supposing I am." Then (p. 539):

> And by using "by far" one indicates how one would know it; i.e., by looking around the class, without any particular interest in finding out the ages, she could age herself relatively to everyone else – which is after all not a thing that many in a class would do. But there are some people who can do it just like that, by virtue of that it's a 'by far.' That is to say, 'by far' is *glance-determinable*. And if it's glance-determinable, then that's how you could have known it . . . It's visible, like anything else

---

[30]This discussion is clearly related closely to the one about "frame-and-slot" analysis in lecture 1 of the Winter 1970 set, and cf. above at pp. xxi–xxii.

in the room, that she is older by far. And as she knows it, so does
anybody else in the class know it.

Sacks then points out that "that the answer says how one knows what one is
saying is a common feature of answers." This is the sort of thing that linguists
(e.g., Chafe and Nichols, 1986) mean by the term "evidentials." But "by
far" is not, I believe, the sort of item (such as modals like "must have,"
attributions like "John said . . . ," access routes such as "I read that . . ." etc.)
that is ordinarily counted as an evidential. It is not a linguistic feature, but a
grasp of the course of action by which such a formulation would come to be
made, and via an appreciation of its consequentiality to the circumstances of
the one making it, that "by far the oldest" as glance-determinable needs to
be understood. For while "by far" may have these attributes for this question
by this asker to this recipient about this setting, it is by no means a feature of
its linguistic realization per se, or even one of its variants. The range of further
observations which an exchange like this can engender, and the theoretical
directions in which they lead (both of which Sacks pursues in the remainder
of this discussion) belong to a domain of inquiry that may well be a necessary
complement to a thoroughgoing linguistics but is not part of it, and should
be part of a thoroughgoing sociology or anthropology, but does not seem
likely to become that either.

    The Spring 1972 lectures present various of the juxtapositions or contrasts
which run through Sacks' *oeuvre*. Lectures 1 and 2 juxtapose discussions of the
most abstract and general sort – characterizing a formal structure, the
adjacency pair, not only as a type or class of occurence, but as a class of classes
– with a detailed examination of a single small excerpt from a conversation
which is turned into a window through which the phenomenology (in a
non-technical sense) of a person's social circumstances and experience is
captured and fleshed out in a compelling fashion, and in a manner which
resonates to the circumstances and experiences of many who might find
themselves in cognate circumstances.

    Lecture 3 begins with another excerpt, but uses it largely as the point of
departure for a discussion of a type of sequence and of a characterizable locus
of interactional experience – the initial contact between someone calling on the
telephone and someone answering. The launching of the discussion from a
particular exemplar of an opening sequence imparts the flavor of empirical
analysis to the discussion, but in fact it is mainly near the end of the discussion
that Sacks takes up particulars of that initial fragment. In between his
characterization is chock full of the products of many empirical analyses, but
only their upshots are offered, with intendedly typicalized reports of conver-
sational exchanges to instantiate the themes, rather than analysis in each case,
for each observation or upshot, with specific instances or exemplars. Here
again Sacks catches the phenomenology of a social-interactional place in the
world, but whereas the place in the first two lectures was something like
"being a certain type of unique person in a setting," here it is a transient
(though potentially recurrent) interaction state – answerer of the phone who

may or may not be the "called," and, if not, who may or may not get talked to.[31]

Lecture 4 is a specially striking exemplification of Sacks' ability to formulate an absolutely abstract issue, problem, or way of conceiving the organization of talk, and then to use it to set a vernacularly characterizable and recognizable class of occurrences into a relevant theoretical "space." Here, Sacks proposes to reconceive all utterances in (a) conversation in terms of three possible "positions:" last, current, next, and he then begins a course of theoretical observations about one of them – "next position" – as a purely abstract possible object; and he finds, given how conversation seems empirically to be organized (especially given the turn-taking system which it seems to employ) a set of characteristics of "next position" per se, characteristics which will always have some particular embodiment by virtue of the particular "current" utterance relative to which another is "next," but which are features of "next" position generically. From one such set of features – that any "next" can accommodate *some* range of possible utterances or utterance types, but *not any* utterance or utterance types – Sacks shows how competition for a turn falls out as a consequence. For a possible next speaker with something particular to say may see that it is possible to say it "next," but that each future "current" may restrict against this sayable in *its* next position. Were things otherwise organized, a speaker with something to say would never need to get a particular next position to say it in at the cost of not getting to say it; everything "intended to be said" could, and perhaps would, get said eventually – in some "any" next turn.

The power of this analytic tool is potentially very extensive, and some of it made its way into the eventually published version of the turn-taking paper (Sacks, Schegloff and Jefferson, 1974). More work along these lines was planned; perhaps some day more will appear, however impoverished by Sacks' unavailability to press it ahead in his own distinctive way.

XII

After the Spring term of 1972 Sacks no longer recorded his lectures,[32] and made no special provision for circulating the work which he was teaching in

---

[31] I should remark that in this lecture – lecture 3 – more than any other place in the lectures, there is a dialogue going on between Sacks and myself – my own part in it having been developed first in my dissertation (1967) and the initial paper (Schegloff, 1968) drawn from it, and then, most proximately to this lecture, in a revision of several chapters of the dissertation for possible book publication, undertaken in the summer of 1970, and discussed extensively with Sacks at the end of that summer. Some of that work has subsequently appeared in modified form, e.g., in Schegloff, 1979 and 1986.

[32] As noted earlier, at least some of Sacks' lectures at the Linguistic Institute held during the summer of 1973 were recorded, though Sacks did not choose to have them transcribed for circulation. As well, Sacks continued to record many seminars and working sessions with students and colleagues.

his classes. As it happened, I was that summer moving from a position at Columbia University to one at UCLA, and for the next three years Sacks and I maintained an often intensive, and intermittently attenuated, period of collaborative work. Most of both Sacks' sole-authored work and mine which appeared over the following half dozen years was the delayed publication of work done and written up much earlier.[33]

Leaving aside for the moment work that was being newly launched or developed in fresh directions during the years from Fall 1972 to Sacks' death in November, 1975,[34] those years saw the drafting of the paper on turn-taking (Sacks, Schegloff and Jefferson, 1974), the earlier-mentioned 'Two preferences . . .' paper (Sacks and Schegloff, 1979), a paper on laughter (Jefferson, Sacks and Schegloff, 1984) and the paper on repair (Schegloff, Jefferson and Sacks, 1977).[35] An extensive account of the foci of work during these years is beyond the scope of the present introduction.[36]

XIII

During the winter of 1974–5, Sacks and I were approached by several faculty members at the University of California, Santa Barbara about the possibility of establishing there an interdisciplinary program focussed on language, discourse and interaction. We explored the possibility through the first half of 1975; we each visited the campus, gave talks, discussed the prospects with the local interested faculty. It seemed increasingly clear that this was a serious possibility, and that what was wanted was just the sort of enterprise that conversation analysis was becoming – had already become. The prospects

[33]Thus: Sacks, 1972a was the published version of Sacks' end product, dated June, 1965, of what (rendered in more accessible language by David Sudnow) was Sacks' Ph.D. dissertation. Sacks, 1972b was a somewhat edited version of lectures from 1966. Sacks, 1972c was originally a graduate student paper, written in 1962–3. Sacks, 1973 was the published version of Sacks' paper at the Georgetown Roundtable held in March, 1972. Sacks, 1974 was the published version of a paper delivered at a conference held in April, 1972. Sacks, 1975 was the edited version of a lecture last given in 1968. Subsequent publications under his name are edited versions of all or parts of pre-1972 course lectures, assembled by Gail Jefferson (cf. introduction to Volume 1, p. ix, n. 1). Only Sacks, 1987 [1973], although edited by others from a lecture, was first delivered after spring 1972.

Of co-authored papers, Schegloff and Sacks, 1973 was drafted (substantially in the form in which it was published) in 1969.

[34]Including his beginning to work with video materials, prompted in part during the 1973 Linguistic Institute by seeing the work of Charles and Marjorie Goodwin and its fit to conversation analytic concerns.

[35]Which Sacks and I outlined together in the spring of 1975, and which I then wrote the intial draft of, after Sacks went off to the first Boston University Summer Session on Ethnomethodology and Conversation Analysis.

[36]After his death, I made a list of papers we had discussed more than once, and more than casually, as needing to be drafted. There were 26 of them. Some account of these years may yet be written.

became increasingly enhanced. Jefferson (on the UCSB faculty that year) could also be appointed; we could tailor a curriculum to the special character of the subject matter and our approach to it; scheduling could be made flexible; space for a collegial, "working group" arrangement was possible; there would be support for our equipment needs, etc.

Finally, in the Fall of 1975, we received a request from those who were guiding these developments at Santa Barbara. They wanted – quite reasonably – to know what we proposed to offer as a program in return for the resources and possibilities which had been discussed over the preceding months. Sacks and I had several informal conversations about this. Finally, in mid-November, we decided we really had to sit down together and draw up a serious plan to offer to Santa Barbara. We decided to meet at Irvine, in part because Sacks had been suffering from an ear infection. We tentatively agreed to meet on a Monday morning. When I called the Sunday night before the scheduled meeting, the infection had not yet fully cleared up, and Sacks was still taking medication for it. But he resisted the suggestion that we delay the meeting. We would meet at the Irvine campus.

It was on his drive from the back canyons of Orange County to the Irvine campus to discuss the specifics of the program in conversation analysis which we might propose to Santa Barbara that his car was involved in a head-on collision with a truck, and he was killed.

XIV

Reading the lectures now, and especially reading ones which entertain agendas of work to be done (e.g., the last pages of Spring 1972, lecture 5), poses again and again the question of where our understanding of language and talk, of interaction and the social fates played out in it, of human sociality from the most intimate emotion to the largest issues of social organization, where our understanding would now be had Sacks not died in November, 1975. Recalling the years immediately following the last of these lectures, when some of that work was being advanced, and imagining what might have been accomplished in a program designed to advance this undertaking, in a supportive institutional environment, enhances the fantasy.

Whether or not the efforts of others succeed in establishing a discipline with satisfactory payoffs and sustainable continuity, we shall not have the discipline, or the understanding, which we would have had with him. Nor will it avail for others literally to try to execute the plans of inquiry which he projected. They were built from the breadth of his own past reading, from the depth and range of his analytic and empirical work, and were the product of the very special métier of his mind. What is needed is a continuous re-energizing of inquiry by the example of his work and the possibilities which it revealed – each person bringing to the enterprise the best mastery of past work which they can achieve and the special contribution which the character of their own talent makes possible. Not mechanical imitation or extrapolation but the

best possible effort to advance the undertaking in original ways will constitute the most appropriate and enduring celebration of Sacks' contribution.

The first lecture presented in these volumes began with a consideration of a conversation's opening; the last ends with a puzzle about how much can be infused into a conversation-opening "hello." An astonishingly rich tapestry of analysis comes between, in an intellectual career which did not tire of repeatedly going back to the beginning, showing again and again that there was an enterprise to be undertaken here. The achievement of the work is to be found not only in its results, but in its prompting of an undertaking, and in its constituting a standing invitation to others to join, and to begin, that undertaking themselves.

A Note on Some Effects of the Taping, Transcribing, Editing, and Publishing upon the Materials

Each process that the lectures have gone through, from taperecording to typesetting, has had its effect on what appears in these volumes. As the lectures were being taped, faulty equipment, excessive background noise, etc., could result in gaps within a recording, or the disappearance of an entire lecture. This has provided an opportunity for the presentation of samples of another instrument, as some of the absences have been filled in with materials from Sacks' research notes.

The transcribing process generated shoals of mis-hearings, only some of which have been corrected. For example, a rendering of 'Oral styles of American folk narrators' as "All styles . . . ", or the transformation somehow of 'Von Neumann' to "Baganin" were caught as the bibliographical references were being assembled. A description, "the police car . . . follows him along for a mile, finally pulls him over," emerged on some nth reading as much more likely to be " . . . follows him along for awhile." And a fresh and knowledgable eye discovered that ". . . and they had a fantastic scene with persons coming in . . . " was almost certainly ". . . and they had a fantastic team of persons coming in," and rather more consequentially, that "That's in part the problem with Reichenbach's second chapter" is in fact reference to his "seventh" chapter, that a murky reference to data consisting of "whatever it is that we have to have" was surely talking about "whatever it is that we happen to have", and reference to "the attending of a prepositional phrase" was obviously reference to the "appending" of the phrase. God only knows what further errors have slipped through.

There was never any requirement that the transcripts be verbatim, and there is variation across and within them, although one small batch was produced with a systematic concern for the very words. Not long after Sacks was killed, a cache of taperecordings of his earliest lectures turned up. These were treated, not as usual working tapes (to be transcribed as quickly as possible and then tossed back into the pool of tapes for reuse), but as something approaching a memorial. At attempt was made to capture as much detail as possible; i.e., to transcribe them at the level of detail used on the research materials, with Sacks' frequent and prolonged silences, long drawn out "uh"'s, and very slight New York accent faithfully notated. But the attempt was abandoned in the middle of the second page of transcript: At that level of detail the lecture was simply not followable. It was necessary to return to the standard format of the workaday lecture transcripts – the sense

of the specialness of this particular batch of tapes relegated to a commitment to word for word accuracy. For the most part, however, some degree of spontaneous editing occurred at the transcription stage.

The editing per se ranges from faithful conservation of the text to something very like wanton tampering. Now and again, remarks on particular editorial effects can be found (see pp. ix–xi, 126–31, and 507–12), but there is no comprehensive discussion.

As the volumes went to press, another series of changes occurred, geared to bringing the materials more into line with standard literary usage, for example, replacement of devices intended to emphasize the fact that these are transcripts of spontaneous talk rather than written text; e.g., the rendering of 'etc.' as "etcetera" and (rather more variably) the rendering of numbers as words, by the standard abbreviations and numerals. And, for example, the various references to books and articles now look very much more like standard bibliographical notes than spoken citations. A reference which went into the typescript as "I come by this sort of consideration via a paper written by a fellow named Richard Gunter, 1966, *Journal of Linguistics* called 'On accents in dialogue,'" became "I come by this sort of consideration via a paper by Richard Gunter, 'On accents in dialogue,' *Journal of Linguistics* (1966)." A typescript entry, reference to a review article "in a book called *Studies in Language and Literature*, edited by A. Marquart, 1954, called 'English sentence connectors,' by Seymour Chapman. That's on page 315," came back as reference to a review article "by Seymour Chapman, 'English sentence connectors,' in A. Marquart (ed.), *Studies in Language and Literature* (1954), p. 315." As a sort of compromise between good form and actual occurrence, the non-initial reference to the author, in this and other citations throughout the volumes, has been restored.

Part I

Fall 1964–Spring 1965

Lecture 1
Rules of Conversational Sequence

I'll start off by giving some quotations.

(1) *A*: Hello
    B: Hello

(2) *A*: This is Mr Smith may I help you
    B: Yes, this is Mr Brown

(3) *A*: This is Mr Smith may I help you
    B: I can't hear you.
    A: This is Mr <u>Smith</u>.
    B: Sm<u>i</u>th.

These are some first exchanges in telephone conversations collected at an emergency psychiatric hospital. They are occurring between persons who haven't talked to each other before. One of them, A, is a staff member of this psychiatric hospital. B can be either somebody calling about themselves, that is to say in trouble in one way or another, or somebody calling about somebody else.

I have a large collection of these conversations, and I got started looking at these first exchanges as follows. A series of persons who called this place would not give their names. The hospital's concern was, can anything be done about it? One question I wanted to address was, where in the course of the conversation could you tell that somebody would not give their name? So I began to look at the materials. It was in fact on the basis of that question that I began to try to deal in detail with conversations.

I found something that struck me as fairly interesting quite early. And that was that if the staff member used "This is Mr Smith may I help you" as their opening line, then overwhelmingly, any answer other than "Yes, this is Mr Brown" (for example, "I can't hear you," "I don't know," "How do you

---

A combination of Fall 1964, tape 1, side 2 and tape 2, side 1, with brief extracts from Winter 1965, lecture (1) – the parenthesis indicate that the original transcripts were unnumbered, the current numbering likely but not certain – pp. 1 and 11–12 (transcriber unknown) and Spring 1965 ('64–'65), lecture 3, pp. 6–7 (transcriber unknown).

The lectures' titles are intended to give a handle on them, and only partially capture the contents.

spell your name?") meant that you would have serious trouble getting the caller's name, if you got the name at all.

I'm going to show some of the ways that I've been developing of analyzing stuff like this. There will be series of ways fitted to each other, as though one were constructing a multi-dimensional jigsaw puzzle. One or another piece can be isolated and studied, and also the various pieces can be studied as to how they fit together. I'll be focussing on a variety of things, starting off with what I'll call 'rules of conversational sequence.'

Looking at the first exchange compared to the second, we can be struck by two things. First of all, there seems to be a fit between what the first person who speaks uses as their greeting, and what the person who is given that greeting returns. So that if A says "Hello," then B tends to say "Hello." If A says "This is Mr Smith may I help you," B tends to say "Yes, this is Mr Brown." We can say there's a procedural rule there, that a person who speaks first in a telephone conversation can choose their form of address, and in choosing their form of address they can thereby choose the form of address the other uses.

By 'form' I mean in part that the exchanges occur as 'units.' That is, "Hello" "Hello" is a unit, and "This is Mr Smith may I help you" "Yes, this is Mr Brown" is a unit. They come in pairs. Saying "This is Mr Smith may I help you" thereby provides a 'slot' to the other wherein they properly would answer "Yes, this is Mr Brown." The procedural rule would describe the occurrences in the first two exchanges. It won't describe the third exchange, but we'll come to see what is involved in such materials.

Secondly, if it is so that there is a rule that the person who goes first can choose their form of address and thereby choose the other's, then for the unit, "This is Mr Smith may I help you" "Yes, this is Mr Brown," if a person uses "This is Mr Smith . . ." they have a way of asking for the other's name – without, however, asking the question, "What is your name?" And there is a difference between saying "This is Mr Smith may I help you" – thereby providing a slot to the other wherein they properly would answer "Yes, this is Mr Brown" – and asking the question "What is your name?" at some point in the conversation. They are very different phenomena.

For one, in almost all of the cases where the person doesn't give their name originally, then at some point in the conversation they're asked for their name. One way of asking is just the question "Would you give me your name?" To that, there are alternative returns, including "No" and "Why?" If a caller says "Why?" the staff member may say something like, "I want to have something to call you" or "It's just for our records." If a caller says "No," then the staff member says "Why?" and may get something like "I'm not ready to do that" or "I'm ashamed."

Now, I'll consider many times the use of "Why?" What I want to say about it just to begin with, is that what one does with "Why?" is to propose about some action that it is an 'accountable action.' That is to say, "Why?" is a way of asking for an account. Accounts are most extraordinary. And the use of accounts and the use of requests for accounts are very highly regulated

phenomena. We can begin to cut into these regularities by looking at what happens when "May I have your name?" is followed by "Why?" Then you get an account; for example, "I need something to call you." The other might then say, "I don't mind." Or you might get an account, "It's just for our records." To which the other might say, "Well I'm not sure I want to do anything with you, I just want to find out what you do" – so that the records are not relevant.

What we can see is that there are ways that accounts seem to be dealable with. If a person offers an account, which they take it provides for the action in question being done – for example, the caller's name being given – then if the other can show that the interest of that account can be satisfied without the name being given, the name doesn't have to be given. That is, if the account is to control the action, then if you can find a way that the account controls the alternative action than it proposed to control, you can use it that way.

It seems to be quite important, then, who it is that offers the account. Because the task of the person who is offered the account can then be to, in some way, counter it. Where, alternatively, persons who offer an account seem to feel that they're somehow committed to it, and if it turns out to be, for example, inadequate, then they have to stand by it.

The fact that you could use questions – like "Why?" – to generate accounts, and then use accounts to control activities, can be marked down as, I think, one of the greatest discoveries in Western civilization. It may well be that that is what Socrates discovered. With his dialectic he found a set of procedures by which this thing, which was not used systematically, could become a systematic device. Socrates will constantly ask "Why?," there will be an answer, and he'll go on to show that that can't be the answer. And that persons were terribly pained to go through this whole business is clear enough from the Dialogues. And it's also clear in our own experiences. And in the materials I'll present.

We see, then, one clear difference between providing a slot for a name, and asking for a name. Asking for a name tends to generate accounts and counters. By providing a slot for a name, those activities do not arise.

We can also notice that, as a way of asking for the other's name, "This is Mr Smith . . ." is, in the first place, not an accountable action. By that I mean to say, it's not required that staff members use it and they don't always use it, but when they do, the caller doesn't ask why. "This is Mr Smith . . ." gets its character as a non-accountable action simply by virtue of the fact that this is a place where, routinely, two persons speak who haven't met. In such places the person who speaks first can use that object. And we could say about that kind of item that the matters discriminated by its proper use are very restricted. That is to say, a call is made; the only issue is that two persons are speaking who presumably haven't met, and this object can be used.

Furthermore, the matters are discriminated in different terms than those which the agency is constructed for. That is, they are discriminated in terms of 'two people who haven't met' rather than, for example, that an agency staff

member is speaking to someone calling the agency for help. And where one
has some organization of activities which sets out to do some task – and in this
case it's important for the agency to get names – then if you find a device
which discriminates in such a restricted fashion, you can use that device to do
tasks for you.

Now, given the fact that such a greeting as "This is Mr Smith . . ."
provides for the other giving his own name as an answer, one can see what the
advantage of "Hello" is for someone who doesn't want to give their name.
And I found in the first instance that while sometimes the staff members use
"Hello" as their opening line, if it ever occurred that the persons calling the
agency spoke first, they always said "Hello."

Persons calling could come to speak first because at this agency, caller and
staff member are connected by an operator. The operator says "Go ahead
please" and now the two parties are on an open line, and one can start talking
or the other can start talking. This stands in contrast to, for example, calling
someone's home. There, the rights are clearly assigned; the person who
answers the phone speaks first. If they speak first, they have the right to
choose their form. If they have the right to choose their form, they have the
right thereby to choose the other's. Here, where the rights are not clearly
assigned, the caller could move to speak first and thereby choose the form.
And when callers to this agency speak first, the form they choose is the unit
"Hello" "Hello." Since such a unit involves no exchange of names, they can
speak without giving their name and be going about things in a perfectly
appropriate way.

Now, there are variant returns to "This is Mr Smith may I help you?" one
of which is in our set of three exchanges: "I can't hear you." I want to talk
of that as an 'occasionally usable' device. That is to say, there doesn't have to
be a particular sort of thing preceding it; it can come at any place in a
conversation. Here is one from the middle of a conversation, from a different
bunch of materials.

> A: Hey you got a cigarette Axum. I ain't got, I ain't got a good cigarette,
>   and I can't roll one right now. Think you can afford it maybe?
> B: I am not here to support your habits.
> A: Huh? My helplessness?
> B: I am not responsible for supporting your habits (   )
> A: My habits ((laughing))

Our third exchange from the psychiatric hospital has the device used at the
beginning of the conversation.

> A: This is Mr Smith may I help you
> B: I can't hear you.
> A: This is Mr <u>Smith</u>.
> B: Smith.

What kind of a device is it? What you can see is this. When you say "I can't hear you," you provide that the other person can repeat what they said. Now what does that repetition do for you? Imagine you're in a game. One of the questions relevant to the game would be, is there a way in that game of skipping a move? It seems that something like "I can't hear you" can do such a job. If you introduce it you provide for the other to do some version of a repeat following which you yourself can repeat. And then it's the other's turn to talk again. What we find is that the slot where the return would go – your name in return to "This is Mr Smith . . ." – never occurs.

It is not simply that the caller ignores what they properly ought to do, but something rather more exquisite. That is, they have ways of providing that the place where the return name fits is never opened. So that their name is not absent. Their name would be absent if they just went ahead and talked. But that very rarely occurs. The rules of etiquette – if you want to call them that, though we take etiquette to be something very light and uninteresting and to be breached as you please – seem to be quite strong. Persons will use ways to not ignore what they properly ought to do by providing that the place for them to do it is never opened.

I hope it can also be seen that a device like "I can't hear you" – the repeat device, providing for a repetition of the thing that was first said, which is then repeated by the person who said "I can't hear you" – is not necessarily designed for skipping a move. It is not specific to providing a way of keeping in the conversation and behaving properly while not giving one's name. It can be used for other purposes and do other tasks, and it can be used with other items. That's why I talk about it as an 'occasional device.' But where that is what one is trying to do, it's a rather neat device.

Let me turn now to a consideration which deals with a variant return to "May I help you?" That is, not "Yes . . ." but "I don't know." I'll show a rather elaborate exchange in which the staff member opens with a version of "This is Mr Smith may I help you" but the combination gets split. The name is dealt with, and when the "can I help you" is offered, it occurs in such a way that it can be answered independent of the name.[1]

> *Op*: Go ahead please
> *A*: This is Mr Smith (*B*: Hello) of the Emergency Psychiatric Center can I help you.
> *B*: Hello?
> *A*: Hello
> *B*: I can't hear you.
> *A*: I see. Can you hear me now?
> *B*: Barely. Where are you, in the womb?

[1] The fragment of data is reproduced pretty much as Sacks transcribed it, preserving his attempts to deal with simultaneous talk (i.e., *A*: This is Mr Smith (*B*: Hello) of the Emergency Psychiatric Center) and silence (e.g., *B*: I uh   Now that you're here . . .). See lecture 9, pp. 66 and 68 for two other approaches by him to simultaneous talk in this same conversation.

A: Where are you calling from?
B: Hollywood.
A: Hollywood.
B: I can hear you a little better.
A: Okay. Uh I was saying my name is Smith and I'm with the
     Emergency Psychiatric Center.
B: Your name is what?
A: Smith.
B: Smith?
A: Yes.
A: Can I help you?
B: I don't know hhheh   I hope you can.
A: Uh hah   Tell me about your problems.
B: I uh   Now that you're here I'm embarassed to talk about it. I don't
     want you telling me I'm emotionally immature 'cause I know I am

I was very puzzled by "I don't know" in return to "May I help you." I couldn't figure out what they were doing with it. And the reason I was puzzled was that having listened to so many of these things and having been through the scene so many times, I heard "May I help you" as something like an idiom. I'm going to call these idiom-like things 'composites.' That means you hear the whole thing as a form, a single unit. And as a single unit, it has a proper return. As a composite, "May I help you" is a piece of etiquette; a way of introducing oneself as someone who is in the business of helping somebody, the answer to which is "Yes" and then some statement of what it is one wants. We can consider this item in terms of what I'll call the 'base environment' of its use.

By 'base environment' I mean, if you go into a department store, somebody is liable to come up to you and say "May I help you." And in business-type phone calls this item is routinely used. And if you come into a place and you don't know what it's like, and somebody comes up to you and uses such an item, that's one way of informing you what kind of a place it is. So, if a new institution is being set up, then there are available in the society whole sets of ways that persons go about beginning conversations, and one could, for example, adopt one or another of a series of them as the ones that are going to be used in this place.

Now the thing about at least some composites is that they can be heard not only as composites, but as ordinary sentences, which we could call 'constructives,' which are understood by taking the pieces and adding them up in some way. As a composite, "May I help you" is a piece of etiquette, a signal for stating your request – what you want to be helped with. Alternatively, as a constructive, "May I help you" is a question. If one hears it as a question, the piece of etiquette and its work hasn't come up, and "I don't know" is a perfectly proper answer.

Further, "I don't know" may be locating a problem which "May I help you" is designed, in the first place, to avoid. In its base environment, for

example a department store, it's pretty much the case that for a customer, the question of whether some person "can help" is a matter of the department store having made them the person who does that. That is to say, lots of things, like telling you whether you can find lingerie in a certain size, is something anybody can do, and as long as the department store says this person is going to do it, that's enough. But we're dealing with a psychiatric hospital. In a department store, being selected to do a job and having credentials to do it are essentially the same thing. In a psychiatric hospital and lots of other places, however, they are very different things. That is, whether somebody can help you if you have a mental disorder, is not solved or is not even presumptively solved by the fact that they've been selected by somebody to do that job. The way it's solved in this society is by reference to such things as having been trained in a particular fashion, having gotten degrees, having passed Board examinations, etc.

Now, in the base environment of the use of "May I help you?" there is, as I say, no difference essentially between having credentials and being selected. If one can formulate the matter in a psychiatric hospital such that those things come on as being the same, then one needn't start off by producing one's credentials at the beginning of the conversation. And in my materials, again and again, when "May I help you" is used the person calling says "Yes" and begins to state their troubles.

As a general matter, then, one can begin to look for kinds of objects that have a base environment, that, when they get used in that environment perform a rather simple task, but that can be used in quite different environments to do quite other tasks. So, a matter like 'credentials' can be handled by this "May I help you" device. There will be lots of other devices which have a base environment, which do some other task in some other environment.

Before moving off of "May I help you" I want to mention one other thing about it. If the base environment is something like a department store, then, when it's used in other places – for example, a psychiatric hospital – one of the pieces of information it seems to convey is that whatever it is you propose to do, you do routinely. To whomsoever that calls. That is, it's heard as a standardized utterance. How is that relevant? It can be relevant in alternative ways. First of all, it can be a very reassuring thing to hear. Some persons feel that they have troubles, and they don't know if anybody else has those troubles; or, if others do have those troubles, whether anybody knows about them. If someone knows about them, then there may be a known solution to them. Also and relatedly, a lot of troubles – like mental diseases – are things that persons feel very ambivalent about. That is, they're not sure whether it's some defect of their character, or something else. That, in part, is why they're hesitant to talk about it. And it seems that one of the ways one begins to tell people that they can talk, that you know what they have and that you routinely deal with such matters, is to use manifestly organizational talk.

"May I help you," then, can be a reassuring way to begin. It can alternatively be something else. Consider the exchange I just showed, in which

such standardized utterances as "May I help you" and "Tell me about your problems" are used.

A: Can I help you?
B: I don't know hhheh   I hope you can
A: Uh hah   Tell me about your problems
B: I uh   Now that you're here I'm embarrassed to talk about it. I don't want you telling me I'm emotionally immature 'cause I know I am

That is, the use of standardized, manifestly organizational talk can provide for the person calling that they're going to get routine treatment. But 'routine', for them, may not be such a happy thing. Because, for example, they've been through it before. But they may have gone through it, as psychiatrists would say, part way. For example, they were in analysis for three years and ran out of money, or the psychiatrist wouldn't keep them on, or they didn't want to stay. Part way, they may have come to some point in the analysis where they 'knew what was wrong with them.' That is, they knew the diagnostic term. But that diagnostic term may have had a lay affiliate. By that I mean, if a psychiatrist says you're regressed, it's a technical term. But 'regressed' is also a lay term, and as a lay term it doesn't have a great deal of attractiveness. If one finds oneself living with a lay understanding of such a term, where the term is not a very nice thing to have in its lay sense, then when you hear someone using such an item as "May I help you," you can hear that some procedure will be gone through, the upshot of which will be the discovery of what you 'already know' – the knowing of which doesn't do you any good.

Related to that are such things as, some people seem to feel very much disturbed about the fact that their relationship to a psychiatrist or to other doctors is monetary. What they want, they say, is a personal solution. Ask them what they want, "Well, that you don't have to pay for it." When they hear "May I help you," they hear 'a professional.' But they feel that the way you get cured is by getting an affiliation to somebody which is like the affiliations that they failed to get in their lives. That is, they may already have come to learn from some other psychiatrist that the failure of love by their parents is the cause of their troubles. Then, what they come to see is that they need the love of somebody else. And they can't get that from a therapist. Because as soon as they don't pay, that's the end of the relationship.

Now let me just make a few general points. Clearly enough, things like "This is Mr Smith," "May I help you?" and "I can't hear you" are social objects. And if you begin to look at what they do, you can see that they, and things like them, provide the makings of activities. You assemble activities by using these things. And now when you, or I, or sociologists, watching people do things, engage in trying to find out what they do and how they do it, one fix which can be used is: Of the enormous range of activities that people do, all of them are done with something. Someone says "This is Mr Smith" and

the other supplies his own name. Someone says "May I help you" and the other states his business. Someone says "Huh?" or "What did you say?" or "I can't hear you," and then the thing said before gets repeated. What we want then to find out is, can we first of all construct the objects that get used to make up ranges of activities, and then see how it is those objects do get used.

Some of these objects can be used for whole ranges of activities, where for different ones a variety of the properties of those objects will get employed. And we begin to see alternative properties of those objects. That's one way we can go about beginning to collect the alternative methods that persons use in going about doing whatever they have to do. And we can see that these methods will be reproducible descriptions in the sense that any scientific description might be, such that the natural occurrences that we're describing can yield abstract or general phenomena which need not rely on statistical observability for their abstractness or generality.

There was a very classical argument that it would not be that way; that singular events were singular events, given a historian's sort of argument, that they just happen and they get more or less accidentally thrown together. But if we could find that there are analytically hard ways of describing these things – where, that is, we're talking about objects that can be found elsewhere, that get placed, that have ways of being used; that are abstract objects which get used on singular occasions and describe singular courses of activity – then that's something which is exceedingly non-trivial to know.

One final note. When people start to analyze social phenomena, if it looks like things occur with the sort of immediacy we find in some of these exchanges, then, if you have to make an elaborate analysis of it – that is to say, show that they did something as involved as some of the things I have proposed – then you figure that they couldn't have thought that fast. I want to suggest that you have to forget that completely. Don't worry about how fast they're thinking. First of all, don't worry about whether they're 'thinking.' Just try to come to terms with how it is that the thing comes off. Because you'll find that they can do these things. Just take any other area of natural science and see, for example, how fast molecules do things. And they don't have very good brains. So just let the materials fall as they may. Look to see how it is that persons go about producing what they do produce.

Lecture 2
On Suicide Threats Getting Laughed Off

Here are some lines that occurred in one of the conversations I collected. This is a woman talking.

A: But about two months ago I was still home on uh one Sunday, oh we had five children and I got home from church and he's got a butcher knife. He told the kids to go to the park and play. This is kind of unusual for him because he doesn't like them, especially the baby, to go anywhere unless we're there.

B: Aha.

A: After they were all gone, I was laying on the couch just reading the Sunday paper and he came over there and started holding this butcher knife at my throat. And I said what is the matter with you. He said I'm going to kill you. I'm going to end it all. And I said oh for goodness sake put it down and go.
 →I started to laugh it off. And he sat there for about an hour. So I thought well, he kept threatening to kill me. And then he would pull it back as if to stab me. And I just laid there and prayed. I almost believed he was crazy.
   And then he had been acting fairly good since then. He doesn't have any religion and I'm Catholic. But I said why don't you go down and talk to the priest. Maybe he would help you.

Here's another, from the same conversation.

A: What if you won't come. I mean how do I– about– Oh, the last time he tried to kill me he sat and wrote a long suicide note or whatever. I don't know. I didn't read it. This was on a Sunday when the kids and I got home from church and he wanted to know if I went to church with the kids and they said of course. She always goes to church with us. He said I know she's got a boyfriend. I said quit acting silly in front of the kids. What's the matter with you. He says oh, and then, I don't know. Anyway, this time he tried to kill me. He wrote this long note.
 →I just acted like I thought he was kidding. I didn't want him to think

---

Fall 1964, tape 5, side 1

12

I was taking him seriously. He said well Joey run down to the police station before I do something I don't want to do. I said Daddy quit it. Joey says Daddy I don't want to go down there, they'll all look funny at me when they read the note. I says Joey run outside, Daddy's only kidding. He says no I'm not. You'd better let me do it. Then he got in the car and went tearing off. I looked for the note last night and he didn't have one, so I thought oh maybe he knew I'd wake up and maybe not. But I don't want to leave it go.

Here's another, from an altogether different conversation.

A: I mean the thing that makes it even more serious to me is the once or twice that I've mentioned it, not deliberately, but kind of slipping, to the family or anything like that, they try to make a joke of it, you know,

B: Well no, see, here we take all of that seriously.

A: And believe me it's no joke because as I say I just don't feel my life is worth anything at this point.

B: Well we take that very seriously and when someone feels that way we try to do whatever we can to try to help them work out of that feeling. And we'd like to help you.

A: Okay, fine then.

And another conversation.

A: I want somebody to talk me out of it, I really do.

B: Uh huh,

A: But I can't call any of my friends or anybody, 'cause they're just going to say oh that's silly or that's stupid.

B: Uh huh,

A: I guess what you really want is someone to say, yes I understand why you want to commit suicide, I do believe you.

Recurrently in these conversations, persons say that when they use the line "I'm going to kill myself," others laugh. And that's not only by self-report, I have things from police reports of suicides where the police then ask persons around, "Well, did they ever threaten to kill themselves?" and those persons say "Well, he said he was going to kill himself but we just laughed it off." And the question I began to address was, what kind of relationship was there between the statement "I'm going to kill myself," and laughter. How is it that laughter would be done there?

Okay, let's hold that problem now and turn to another set of materials, via which we'll be trying to see what might be involved in it. I said about the opening lines of conversations that they seem to come in pairs. And that one person could choose the form of greeting he used. And that if one person

could choose their own they could choose the other's. Now it seems that there is a general class of such kinds of things, which I'm going to call 'ceremonials.' Other examples are, for example, "How are you feeling?" to which you return "Fine." If one person, then, uses a ceremonial, the other properly returns with a ceremonial.

Let's look at "How are you feeling?" It's routinely used between persons as either a greeting or greeting substitute. And it's used between persons who needn't have very much intimacy. But there is a smaller group of persons included in the circle of persons who routinely use this object. Call the larger group 'others' and the smaller, a special class of others. I won't at this point go into describing in detail what the properties are of this special class of others. Roughly, they are persons who, if one has a trouble, one turns to them for help. Without giving some of the ways we could talk about their relation to some 'one' – call that one Ego – like, for example, they may be kin, I want to approach it in a little different way. One of the ways they stand to each other is, if something happens to Ego, then, whoever it is that might be trying to discover why that thing happened, could refer for explanations to these others. So let's say they're 'causally bound' to the person who may have trouble.

And that could quite easily make it apparent how it is that if such a one is turned to for help, they have a feeling of obligation. They would have a feeling of obligation by virtue of the fact that if, let's say, a suicide occurs, then, even if they hadn't been approached for help in the first place, the question would be asked, well what was up with that family that she should have killed herself? Many things that might happen to Ego will be causally explained by virtue of something that the other did. And if others want to avoid that happening to them, then when some Ego turns to them, they feel like giving help. And of course the fact that these others walk around with all kinds of guilt turns in part on that causal relationship. Now this is among laymen; you don't have to have scientific theories to feel this causal involvement. Any layman would ask, if somebody says "My brother killed himself," "Well what's the matter with the family?" That's where you would look for the source.

Further, somebody who is not a part of this small group of others can become causally involved by virtue of the fact that Ego has asked them for help in some way and been turned down. If something then happens to Ego, it seems that even if you aren't one of that small group of others, you know about the fact that Ego was troubled, how come you didn't do anything? So knowledge of the trouble is often sufficient to bring one into causal involvement.

Now these people, the whole circle, are going around constantly saying "How are you feeling?" Properly, the return is "Fine." And this can be fairly dramatic. I've sat around in hospitals, and in a hospital persons who are, say, recuperating from serious diseases may be sitting in wheelchairs outside their room or in the common room, etc. A doctor walks by a person who looks like they're just about to go, and says "How are you feeling?" and they say

"Fine." Sometimes, however, a person may take that "How are you feeling?" and attempt to use it to present their troubles. And one sort of thing that happens in that case is that persons who listen when somebody begins to tell them their troubles, talk about themselves routinely as 'softhearted,' 'fools,' and that sort of thing. And when persons talk about themselves as softhearted with respect to others, it's probably something like this that's happened to them: They listen, then they find themselves 'involved.' Involved, however, without the basic properties that would initiate their relevant obligation, but not knowing what to do. And not knowing how to get out, either, because they 'know too much.'

On the other hand, the fact that there is that ceremonial relation between "How are you feeling?" and "Fine," may set up the following situation. Routinely, if you look at first interviews (and perhaps later interviews also) between psychiatrists and patients or possible patients, they begin like this:

> *A*: How are you feeling?
> *B*: It's a long story.
> *A*: That's alright, I have time.

What is this "It's a long story," and things like it, doing here? The person knows that the line "How are you feeling?" is a ceremonial line, and it's a breach of the proper forms to begin to launch right then and there into what it is that's bothering you. So what they then do is try to initiate another ceremony which would provide the basis for them talking. Typically this other ceremony is nicely done, in that what one does is offer a tentative refusal, like "It's a long story" or "It'll take hours," which turns it back to the other, referring to their circumstances; for example, their schedule. And it invites the other to then say that their schedule does not control your activities, so go ahead and talk.

Now, persons who are causally bound are obliged to give help when help is asked for. That means in part that they're in bad shape if they don't give help and trouble occurs. They're responsible for someone. Others hold them responsible, and they feel responsible. The question is, is there some way that they can go about refusing to give help without 'refusing,' in the same way that I've talked about refusing to give one's name without 'refusing'? One solution would be to find a way to set up the first remark as the first remark of a ceremonial. Because then the proper return is a ceremonial. While there are some ceremonials that come off strictly by virtue of the particular object that's used, there are others that are classes of ceremonials. Three common classes are jokes, games, performances. They all have the character that the next move – or some other given move in the sequence – is the end of it, and that's the end of the whole thing. You tell a joke, there's a laugh. A game has a set beginning and end. A play has the same character.

That is, I think it's the fact that we have ceremonial relationships between various objects and their proper returns, that sets up the sort of business we started off with: "I'm going to kill myself" followed by laughter. When

somebody says "I'm going to kill myself," if the other can cast it into one of the ceremonial forms, then that can end the interchange. One wouldn't have heard the 'cry for help.' One would have heard a joke. And one would have behaved properly with respect to a joke. And it appears that, alternatively to giving help, one gets cases of just those three common classes of ceremonials. Somebody laughs, or they say "Nice performance," or "Quit playing." And that would provide, then, for closing that thing off without, however, having been in the situation of refusing help in the sense of saying "no," or other such things. So we can see how that form provides for this thing to happen.

We can also see how awfully painful it must be for persons who are deeply troubled, and who constantly have people coming up to them and saying "How are you feeling?" when they can't come back. Now and then we see that very problem referred to in a joking form. Here is an instance.

   A: How are you feeling?
   B: You really want to know? ha ha
   A: ha ha

That is, someone, asked "How are you feeling?" jokingly proposes: What if I were to take this, not as a ceremonial form, but as a serious invitation. Then where would you be? And when people are asked "Well why don't you tell somebody?" they say "It'd be like a melodrama!" or "How can you tell them, they'll just laugh!"

I want to say another thing about ceremonials. Here is something very nice. Very lovely. Lovely in a way, but quite awful, also. When I was thinking about this stuff, I came across a very frequently recurring kind of statement. I'll just give one case; a long extract in which a widow is telling a psychiatrist of some problems she is having with her married daughter.

   A: Well, I'll tell you really what got into me last week. You know I was
          just talking about Thanksgiving beingThursday, and she had to
   →prepare, but she didn't invite me. And I go home and I start to think
          about it, and you know, when I spoke to you alone there a couple of
          minutes, I shouldn't have talked about that, because there was
          something else that was— I mean I touched on it, but there was
          something else.
   →I just had a feeling that I wasn't wanted anymore in their house. At
          least by her husband. Naturally she can't do anything about it. You
          know, I mean if she could, she would start fighting with him, and I
          wouldn't want to be a cause of that you know. But I thought that
          because, when I first went to the doctor that I went to, this internist
          I was going to last July, and she suggested that I go to a doctor in the
          Valley that she knew. She says well, it's a good idea because if you
          have to be hospitalized, or if you're depressed or anything, you could
          stay with me for a couple of days. She says I can't get down to see you

that often, with the children. But I'll take care of you if you stay at my house.

So this is in July. And I wasn't able to go to him because I didn't have the money to go. I finally in October, had to go to the hospital. And I was there for three days and got these tests, which just made me awfully weak, and when I got out she called for me because she had my car while I was in the hospital. She called for me and didn't

→ask if I wanted to stay over that night. I get out of the hospital and I have no– and I have to drive home, and I felt so weak by myself. I mean, she couldn't because otherwise she couldn't have gotten back. I mean it was just one of those things. But the better thing would have been if I could have stayed up there at least overnight and when I felt

→fresh, take the trip down. But she didn't even ask. And I know it isn't like Lila not to ask, when this was the original reason for my going up there. And I just know that she was warned that she better not bring me home.

And of course I started feeling sorry for myself. And then, when we were there Wednesday, she said something about preparing a

→Thanksgiving dinner next Thursday and she didn't say anything about me. I figured, well, instead of the family, which we always had, the family together, it's not at my house, it's at her house. I mean during the time I was married I used to have seventeen or twenty for dinner because the whole family. And then she had taken over lately. So I thought well, maybe she's gonna have her son. And it's not up to me to expect her to have me. And then I thought well, maybe she figured Jay

that's the son

is going to be there, and we're not getting along right now, and she is leaving me out in the cold. And I just began to feel sorry for myself.

Etcetera. Then she goes on to say:

Well, it turned out that she said to me, when I said for Thanksgiving,
→"Well don't I <u>always</u> have the family?" I said "Well you didn't ask me, how am I supposed to know what's going to be <u>this</u> year?" I mean generally I don't stand on ceremony, but conditions are, they've been different lately, you know.

A recurrent thing that I've seen throughout this stuff is persons talking about not feeling wanted anymore. The question is, how is that kind of feeling provided for in this society? And what would be interesting about it would be if we could see some way in which, quote, the structure of society, provided for the focussing of kinds of troubles. That's what I think we can see

with this,[1] if we just consider ceremonials a little further. We can note that there are classes of events which, between persons who are not terribly intimate, get initiated via ceremonials. "Would you like to come over for dinner tonight?" "Sure." That is, for these kinds of events to occur, there has to be an invitation, an offer of some sort. So that's one task of ceremonials – they do the job of providing for these events to take place.

They do another job, in a way. When persons are quite intimate, then one way they measure that is by virtue of the fact that invitations are no longer relevant. You can go over to their house without being invited. And people will say to each other, "Come over any time you want." Now with a husband and wife, one gets a version of this not feeling wanted, which goes something like this:

> *Wife*:   Why don't you ever ask me to go out to dinner anymore?
> *Husband*:   If you want to go out to dinner why don't you just say so?
> *Wife*:   I don't want to go out, I just want you to ask me.

What she's picking up here is the absence of ceremonials. And ceremonials have this double use. On the one hand they are properly used to provide for persons to do things – come over, go out to dinner, etc. – at some state of a relationship. At another state those things happen without them. And they're not absent. Indeed, it surely happens that somebody might say, "Well why don't you come over tonight?" and the other says "Why are you suddenly making a big deal of it?" But this double use then provides that when somebody has some doubts of some sort, they could focus right in there; that

---

[1] Throughout this volume many of Sacks' pronominal uses have been changed. Here, the operation is more or less innocuous. What is rendered as ". . . if *we* could see . . ." and "That's what I think *we* can see . . ." actually goes, ". . . if *we* could see . . ." and "That's what I think *you* can see," i.e., the second 'we' is actually 'you.' This change instances an editorial policy concerned with solving 'direct address' as a problem to a reader (e.g., "You ought by this time to be quite aware of the fact that . . ."). The policy takes as a resource and license Sacks' own use of the pronouns 'you' and 'we' in alternation (e.g., "We want to do [X and Y]. You want a method that generates this."), and his somewhat eccentric use of 'we' in particular. For example, he will use 'we' when he himself is the obvious referent (e.g., "Remember we said about the opening lines of conversations that they seem to come in pairs") or when the class is the obvious referent (e.g., introducing a "much more interesting thing that I doubt we've noticed"). For a more elaborated discussion, see Appendix A.

Of the range of changes made to the unedited transcripts, very few are marked and explicated. It might also be noted that the faithfulness of the unedited transcripts to the very words is in principle suspect. Such preservation of the very words as there is, is variable. That was not part of the enterprise – with the exception of the retranscribed Fall 1964 lectures, which were produced after Sacks' death. All of which is to say that the spontaneous nature of the lectures themselves, the variable fidelity of the transcripts, and the manifold changes made in the editing, result in a version of Harvey Sacks' work which from start to finish was in one sense or another not under Sacks' control.

they see this thing is absent, and see the absence via the position of one who is not in the position of intimacy. And they don't know quite how to handle that matter. Because if they complain, they get "Why are you standing on ceremony?" and if they don't complain and don't get the invitations, they figure "Jeez, it's the case that I'm not wanted anymore."

Now I can't make any statement psychiatrically about why persons would pick up that double use of ceremonials and use it – or feel used by it – with their doubts. But in any event, one can see how it is that the fact that those things get used that way, provides a locus for troubles to get focused on.

Here is another, related, phenomenon.

A: Hope you have a good time.
B: Why?

The "Why?" here is quite apparently a paranoid return, and the whole conversation from which this comes makes it quite clear that the person who produces it is paranoid. I won't quote the whole conversation, I want to just focus on this interchange for reasons I'll make clear.

One of the things that's reported about persons who have to deal with paranoids is that they feel weak, experience a terrific lack of control when they encounter them. Now you could go about trying to examine that, perhaps by studying let's say the comparative dynamics of the persons, or various other things. But I think you can get an idea of how they would have that feeling of weakness by just examining an interchange like this. We're talking about ceremonials. The normal answer to this "Hope you have a good time" is "Thank you." And if one uses a line like "Hope you have a good time" one can expect to control the return of the other. In this case the line doesn't control the return of the other, and we can at least begin to see what it means to feel weak: Having an expectation of doing something as controlling, and finding out that it isn't that at all.

But furthermore, this "Why?"–return casts this "Hope you have a good time" into the character of an 'accountable act.' Normally, when one does an accountable act, one knows that one is doing an accountable act. This one comes off like this:

A: Hope you have a good time.
B: Why?
A: Why? Well, I just would like– you know, you ought to have a good time if you're going on a trip.

What seems to be involved here is, doing something that wasn't seen as accountable, having it turned into something that is accountable, one doesn't have an account. One offers, then, an account which one feels is quite feeble. It's feeble in a special sense: Not only is it inadequate, but it's inadequate by virtue of the fact that there's no reason to have had an account in the first

place. But when one delivers the account, one may only see that it's feeble, and get the sense that, "Jesus I'm behaving inadequately here."

And that character, that others can by virtue of their return cast your activity into something other than it was produced to be – or that they can by virtue of their return cast it into what you thought it was – is a very basic problem. I call it Job's Problem. Remember the Book of Job? Job is a rich man, doing marvelously. Then everything is destroyed. Job's position is that he didn't do anything wrong; this was not 'punishment.' And now his friends come, and they say to him, "Just confess to what you did wrong and everything will be fixed up." That is to say, the appearance of his pain and of his loss is sufficient indication for them that he did something wrong. And the problem as they see it is that he isn't about to confess to it. Job, then, is in this position of, "Well Christ, the world has changed for me. And maybe I *did* do something wrong." But he is not about to acknowledge that. But most people do. Most people, when they get into a situation, will say, "What did I do wrong?" or "What did I do to deserve this?" That is to say, treatments are 'proper treatments.' And one isn't in a position of saying right off, "You're treating me wrong." Rather, one finds, the treatment occurred and it must be about my action.

Lecture 3
The Correction–Invitation Device

Let me give a quotation.

A: Do you have a gun at home?
B: A forty-five
A: You do have a forty-five.
B: Uh huh, loaded.
A: What's it doing there. Whose is it.
B: It's sitting there.
A: Is it yours?
B: It's Dave's.
A: It's your husband's huh
B: I know how to shoot it.
A: He isn't a police officer.
B: No.
A: He just has one.
B: Everyone does, don't they?
A: You have a forty-five and it's loaded.
B: Uh huh,
A: And I suppose maybe everyone in Burnside Park has one. I don't know.
B: No. But I mean a lot of people have guns. It's not unusual.
A: Oh sure. I see.

The first thing I want us to see in this, I think we have two of, more or less. It's this use of "Is it yours?" and then this one, "He isn't a police officer." I want to call them, and things like them, 'correction–invitation devices.'

By that I mean: Where one wants to get, from the person one is talking to, an account of something – why they did something or why they have something – one way you can do it is by saying "Why?" Another way you can do it is by asking with the name of the class of things you want. For example, a woman is talking to an officer from the juvenile division of the police force. Her 14-year-old daughter hasn't been coming home at night. The woman called the police, the police found the daughter, and now they're talking to the woman. And they say, "Have you ever had this kind of trouble with her?" That is, 'this kind of trouble' is the name of the class. She can then say, "No

---

Tape 5, side 2, and a brief extract from Winter 1965, lecture 7 pp. 12–13 (transcriber unknown).

21

I haven't had this kind of trouble," she can say "Yes" and then give some instances, or she can say "No I've had other kinds of trouble."

Now it also seems that one can ask for an account by naming, in question form, one member of the class, of which the account will be another member. For example, "Is it yours?" She doesn't come back and say just "No," though people sometimes do that. She says "It's Dave's." That is, instead of saying "Whose is it?" which he said earlier but didn't get an answer to, he gives one possibility and thereby elicits, as its correction, another; the actual class member.

For "He isn't a police officer," the problem is, how is it that the husband happens to have a gun? There are classes of good accounts which would explain why somebody has a gun – that is, has a gun properly. One member of that class is 'police officer.' And what could happen is, if "He isn't a police officer" is an instance of the correction–invitation device, and if the device had 'worked,' then the return would be, "No, he's a such-and-such," or "No, we have it because . . ." Here's another example. Two persons are talking on the phone:

> *A*:   What do you think was the cause?
> *B*:   It's a little difficult for me to speak now.
> *A*:   Oh it is. You're feeling badly yourself?
> *B*:   Oh no. It isn't it. I'm lacking in privacy.
> *A*:   Oh you're lacking in privacy. Well, why don't we arrange to talk tomorrow.

"You're feeling badly yourself?" would be one account of how it is that B finds it a little difficult to speak now, and the return is the correct account.

I'll just mention one way that these things get used, which can get us to one basis for their use in the first place. When police interrogate persons, one thing they do is, instead of saying "Are you the guy that murdered this fellow?" they say "Did you hit him with a tire iron?" And the guy says "No," and then they say "Well what did you hit him with?" where the guy hasn't admitted yet that he did it. And it may be the fact that this form is so routinely used elsewhere that permits it to set up the possibility of a trap like that.

Now, so far I've talked about the construction of these correction–invitation devices, and said that it's based on the fact that, using a range of classes, you can refer to one member to get another member. We might also be able to say something about the basis for their being used in the first place. And at least one basis for that is perhaps something like the following. If you say to somebody "Why did you do this?" then what they are being asked to present is something they may well know they have to defend. And you set up a different situation when what they have to present is something they know they have to defend, as compared to setting it up such that you're not asking for an account they have to defend, but you're 'inviting a correction.'

If these different forms can set up basically different situations, that would suggest that we're looking at extremely powerful matters. I don't know that they're that powerful, but if they are, that's a very important thing to know. That is, that just by the way you set up the matter, without regard now to the consequences in a large sense – as in the murder interrogations – this thing can work.

The fact that these things are not only recurrent, but that they do work, makes them worth looking at for the following sort of reason. Sociologists often talk about something called 'common knowledge.' And one question is, what is it that common knowledge consists of? One thing it can consist of is just lists of items that persons know in common. But there are some things it would be nice to know about the phenonenon of common knowledge. One of them is what we could call its 'structural properties' – and we'll talk about lots of them, I hope. Also, how it is that what persons know 'in common' is organized. Also, is it the case that the organizational features of what they know 'in common' are also known?

So if persons know that there are classes of accounts for some action, the question is how do they know those classes? For example, do they know them only if you name the class, then they know one or another which are members of the class? What this stuff seems to suggest is that on the one hand they probably do know, to some extent, the classes and items of these classes by virtue of the class name; 'kinds of troubles,' for example. But they also know them in this fashion: You can name one, and they know, by virtue of the use of that one, what class you're referring to, and can give you another. And that's a non-trivial way of seeing that, and how, common knowledge has its organization seen and understood by Members.

Now I haven't yet been able to track down when this thing works and when it doesn't work, or what we might say about the circumstances where it might be clear that a person knows how to use this, and knows what another account is, and doesn't pick it but instead answers only 'the question:' "He isn't a police officer," "No."

And in that regard, another question about this organization of common knowledge and the members of the class 'accounts' would be, how substitutable are accounts for each other? Is it the case that one is as good as another? Which ones would be as good as another for this or that account problem? And I ought to mention that the correction–invitation device may not only work for accounts, but for all sorts of things; that is, where you can name an item, and get in return another item.

Let me turn to another sort of thing that we can see in this piece of conversation. This line, "Everyone does, don't they?" is one of the most fabulous things I've ever seen. Where persons are engaged in trying to get an account from somebody, there's an object that the person who's being questioned can slip in. This is one of them. And what it does is, it cuts off the basis for the search for an account. I don't have a terribly elegant name for it. What I called it was, 'account apparently appropriate, negativer.' Or A3N. So, for example, having a gun is something for which an account is apparently

appropriate. The search goes on for an account, this thing goes in, and now an account is no longer to be sought. And this thing isn't an account of how she happens to have a gun. That would be quite a different thing.

Now these are extraordinarily interesting. One of the most interesting things about this one in particular – though it's not so for all of them – is that it seems to be a 'general purpose A3N.' By that I mean, it doesn't much matter what it is that you're seeking an account about, you can use this one, 'everybody does.' This object cuts off accounts about God knows what — where accounts are, of course, extremely crucial phenomena. It's a general purpose device. And we'll see some more later on, some of them much more extravagant than this. Just consider, with respect to the organization of the social world, that we're told how fantastically complex it is. How everything is a blooming, buzzing confusion. How everybody is different. Etcetera. That there are these general purpose devices might give a glimmer, perhaps, of an extraordinary kind of simplicity.

By and large I've only talked about verbal interaction. Let me just mention something that isn't a verbal device. My parents live in an 'exclusive' suburb. And when I was a kid in high school I always used to walk around at night in the streets. And when you walk in the streets at night in exclusive suburbs, you're liable to get – as I was routinely – picked up by the cops. "What are you doing?" "Just walking." Then they would take me and stand me in front of the police car with the light shining in my face and call up the police station to find out if I indeed did live there. This happened night after night. Finally, someone gave me the solution. If you bought a dog, that was the end. You never got stopped. And that has now become a matter of common knowledge. It has become so much a matter of common knowledge that in the book *Beverly Hills is my Beat* by a Captain Anderson, head of the Beverly Hills police force, he writes, "It used to be the case that an excuse to walk the streets was having a dog. However, the robbers started walking around with dogs. But don't try it in Beverly Hills, because we also know the dogs."

So we can begin to locate a range of general purpose A3Ns, with greater or lesser generality of application. 'Everyone does' has enormous generality. Another thing to notice about it is, it doesn't seem that evidence needs to be offered. That is, it's not the sort of statement about which someone will say, "How do you know that's so?," where there are lots of statements which will get such a question. It's been known for a long time that there are classes of objects – a very predominant class of which are proverbs – about which, on the one hand, Members don't have doubts, and on the other, it's not a matter of evidence that they're so. And the existence and use of such objects is fairly obviously the basis for a great deal of philosophy. Hume, for example, talked about the fact that when he was sitting and doing philosophy, there were lots of things he could doubt. But he found that as soon as he got up and walked out of his study, they were just there. And in an important sense, he had never doubted it. It may well be that these are the sorts of things he was trying to figure out what in the world they were, and how it is that they seem to do what they do.

Again and again we find that when such general-purpose devices as A3Ns and proverbs are used, others don't attempt to question them or contradict them. I think there's some reason why we don't much see attempts to question or contradict these things, and that is that they may be such basic objects – that is to say, Members are so committed to their correctness – that if you undercut one, exactly what you've undercut is not clear. And one doesn't know exactly how we can continue talking.

My reason for saying that is the following. A woman was collecting research materials by going into parks with her children and just starting conversations with people. One of the things she reported was how the conversations began. And one recurrent way they began was, there would be a woman sitting on a bench. This woman would go over to the bench with one of her children, and sit down. The little boy would wander around for awhile, then he'd come up to her and she'd say, "Go away, I want to sit and rest." Sometimes he'd go away, but sometimes he'd sit there, annoyingly. And then the other woman would turn to her and say, "They're all like that, aren't they." And she'd say "Yeah" and they'd get into a conversation. I asked her, "Did you ever say no, or something like that?" And she said "Yeah, when I first got out of college I was all full of information. People would say that to me and I'd say 'Well I don't know, my kids aren't.' And they'd always stop talking right then and there."

I don't know that that's generally true. I'd like to see whether it's so, that if you don't express commitment to these sorts of things, person feel that they can't really talk to you. But apparently proverbs and things like them have to be affirmed or membership is not seen as something both of us hold in common. That is, these things are known to be so – whatever that means – but if you ask for evidence for them, then apparently it's not clear what kind of a box you're opening up, what sort of things you're going to ask for evidence about next, what would stand as acceptable evidence. So they're just known to be so, whatever that may mean, in that they can be asserted, they can be used in conversations, etc. They're not known by virtue of ever having been established in some specificable way. In that sense, they're strictly traditional pieces of information.

Lecture 4
An Impromptu Survey of the Literature

Books like *Plainville, Street Corner Society, The Gang, The Irish Countryman,* and a series of others, were part of a kind of sociology done in the United States mainly 25 to 30 years ago. It's associated with the University of Chicago, and also with Harvard. At that time those fellows were trying to build ethnographic studies in a tradition that had been developed largely in England in social anthropology, and there largely by studying tribal societies.

That work essentially died out in the United States. But in recent years, anthropologists are again returning to detailed ethnographic work, and the term 'ethnographer' which had fallen into considerable disrepute, has been adopted as an 'in' term. *The Urban Villagers* by Gans is one recent book which is again attempting to do that sort of work. Two other recent books in the same vein are *Millways of Kent* by John Kenneth Morland and *Blackways of Kent* by Harlan Lewis.

This recent work is of a new sort, in a way. Where much of the early work was criticized as being impressionistic, casual, not hard; that is, not reproducible, not stating hypotheses, etc., the new ethnographic work — which is calling itself things like 'ethno-cognitive studies,' 'ethnocultural studies,' 'ethnoscience' and the like — is attempting to proceed without being subject to those criticisms. The concern is to try to describe the categories that members of a society use, but to describe those in a very hard fashion.

There are several bases for this renaissance — if it's a renaissance. First, the development of very strong tools by linguists. Second, the impact of the work of Whorf, whose collected papers are now in a paperback called *Language, Thought and Reality.* Third, and of pretty much equal importance, is Wittgenstein's later philosophy, which the anthropologists who do this work are familiar with. The relevant books are two volumes put out as one called *The Blue and the Brown Books,* of which *The Brown Book* is the easiest introduction, though it's not easy, and the book called *Philosophical Investigations.*

Tape 3. These materials were probably produced in response to a student's question.

Transcriber unknown. This is the first of several lectures comprised wholly by an early transcript for which there is no tape; i.e., which could not be retranscribed. There are several of these 'unknown' transcribers whose work is included here, without whom the first set of lectures would be significantly impoverished.

My own relation to that stuff is fairly tangential in some ways. Instead of pushing aside the older ethnographic work in sociology, I would treat it as the only work worth criticizing in sociology; where criticizing is giving some dignity to something. So, for example, the relevance of the works of the Chicago sociologists is that they do contain a lot of information about this and that. And this-and-that is what the world is made up of. The difference between that work and what I'm trying to do is, I'm trying to develop a sociology where the reader has as much information as the author, and can reproduce the analysis. If you ever read a biological paper it will say, for example, "I used such-and-such which I bought at Joe's drugstore." And they tell you just what they do, and you can pick it up and see whether it holds. You can re-do the observations. Here, I'm showing my materials and others can analyze them as well, and it's much more concrete than the Chicago stuff tended to be.

And I differ from the modern anthropologists, though I would recommend that work very much. There is a paper by Hymes called 'The ethnography of speaking' which is quite interesting. And then there is a collection of these anthropologists' most recent works called *Contributions to Cultural Anthropology* edited by Ward Goodenough. The trouble with their work is that they're using informants; that is, they're asking questions of their subjects. That means that they're studying the categories that Members use, to be sure, except at this point they are not investigating their categories by attempting to find them in the activities in which they're employed. And that, of course, is what I'm attempting to do.

There are other matters of a deeper sort which are perhaps relevant to why sociology took the course it did, and they're intrinsic in Durkheim's work. One of them is the notion that the order of social events is macroscopic, in the sense that you had to assemble lots of events to find statistically what it was that was doing the work. I think one can begin to see, in the stuff I've been talking about, that it may well be that things are very closely ordered. And what we have may be something like the following. There may be collections of social objects – like "How are you feeling?" – which persons assemble to do their activities. And how they assemble those activities is describable with respect to any one of them they happen to do. That's a different kind of order to a social world.

In a way, most of sociology could have been irrelevant, and what I do could have been done 50 years ago, 100 years from now, etc. As I said before, it stands in close parallel to classical naturalistic biology or zoology.[1] In fact, if you want to look at something, Darwin was doing this already. He wrote a book, *Expression of the Emotions in Man and the Animals*, where he collected pictures and tried to see if there were, for example, standardized expressions, and if so, how did they operate? Not until 50 to 60 years after that book was published did people again begin to use photographs. So, for example,

[1] This may be a reference to an introductory lecture, of which we have only a paragraph-long précis by an unknown transcriber.

Bateson and Meade began to do that some 25 years ago in *Balinese Character*.

But by and large the direct study of humans and their behavior wasn't done. And it probably wasn't done because nobody believed that it could be done, or perhaps because it wasn't interesting for some reason or another. More recently, those who have tried to study it very closely – for example, Bales in his laboratory work – have done something exceedingly foolish, I think. That is, Bales has the notion that you can categorize it as it comes out, so that you sit and watch people as they are talking, and write down categories of what they're doing as they're doing it. That makes it into some kind of trick. There's no reason to suppose that you should be able to see it right then and there. (I find it hard to imagine, for example, that a fellow would stand next to an electroencephalograph machine, or any other such machine, and try to give you an analysis of the data as it comes out on the tape.) Instead, you take these little pieces and you try to collect those that look alike, and it can take an awfully long time to understand any given one.

Another thing that might have been involved was the notion that you could tell right off whether something was important. So you would start to look at what kings did, or to look at votes, or revolution, for example, because those were obviously important. But, for example, the whole of biology has been revolutionized by the study of one bacteria, though when that bacteria was first being examined, no one had any idea that it would do that work. And it's possible that some object, for example, proverbs, may give an enormous understanding of the way humans do things and the kinds of objects they use to construct and order their affairs. That has to be seen by attempting to analyze the stuff.

And in that regard, a debt is owed to Freud, who did say "Now let's treat patients as sacred phenomena." That is, something that you would study in the sort of way that biblical critics have studied the Bible, where the fact that you were looking at one line wouldn't mean that you could only write a page on it. You could write 100 pages. You could spend your life studying it. The reason that sociologists haven't studied a line is that they treat it as something very ephemeral, where if you treat it as a machine itself, and as enormously recurrent, it has quite a different character. But, for example, the American philosopher Meade was a most extraordinary figure who proposed that psychology was the study of that which is not available to observation. He had an enormous impact on sociology, God knows how or why. It may in part have had to do with the notion that sociology studies 'society,' which has been a very troublesome idea because then you start out by saying, "Well, society isn't observable, but Meade has shown that you can study things which aren't observable. So let's go study things which aren't observable, like attitudes."

But social activities are observable; you can see them all around you, and you can write them down. The tape recorder is important, but a lot of this could be done without a tape recorder. If you think you can see it, that means we can build an observational study, and we can build a natural study.

Now all of this is background. I don't want to go through the history of sociology and show why one does this or that, because first of all if you want to do it seriously, you have to know what kind of work theorizing is, and that is an extremely obscure domain if you're going to take it seriously, at least as I take this stuff seriously. I have no idea why sociologists do what they do, and I don't want to get into long arguments about matters which really can't be taken seriously. My arguments can't be taken seriously, Mills' arguments about the effect of Parson's proposal to reraise the issue of 'are ideas important and what kind of resources do we have for asking that question' can't be taken seriously. We can talk about it as philosophers in conversation, but to talk about it in any serious way presumes that we have an enormous amount of information about how the animal operates, which we don't have. So the more material you have at your command, the more you ought to be able to pick up items and see their recurrence and get some idea of what they might be doing. But the way to proceed is item by item.

Q: How does this fit into the general definition of sociology and social structure, as structured?

HS: That's a good question, for the following reason. What has definition got to do with anything? Let's consider what a definition can do. A definition could be an epitaph to be put on a headstone: 'That's what this was.' The notion that it's a control of activity – that is, if you don't define what you're saying you can't do anything – is an absurdity. Just consider, for example, the fact that biology was said to be 'science of life.' Now they find out that maybe there wasn't anything such as that, or that it doesn't make much difference. In any case, it never controls any of their work. So one doesn't know what 'life' means until one knows all the things that the biologists try to show. And you may find out that it's not the kind of thing you started out with at all.

There isn't an answer to what you ask. But I'm not sure what you asked had, in any deep sense, a right to be asked. If you take it, as I do, that a question has to arise out of something you're trying to deal with, as compared to a way you've been taught about questions, then your question might not arise.

It's a big problem about the University as a scene, that you have almost a free right to ask questions. You can turn almost anything into a question, and it's not insane. You learn that much of the knowledge that you're going to get is formable as the answers to questions, because after all you have to be given it in such a way that you can answer it if I use it as a question on an exam.

Now that's a fantastic constraint on scientific research – that, for example, the product of research is subject to being used in a quiz. My own feeling is that it was the death of academic psychology that it grew up in a university. That implies that they did experiments for which it could be seen from the start how the results of those experiments would look as answers to quiz questions. If a research couldn't be formed as a quiz question eventually, then maybe you just didn't do it. Other fields, like biology and astronomy, developed well outside of the universities, so they had lots of materials already

worked up by the time they got into the universities to be taught in this
fashion.

And there is, for example, the notion of 'courses,' where there's a
beginning and an end – an organization. What has that to do with the
physical or social phenomenon you're studying? And textbooks. You have to
have introductory textbooks in sociology or sociologists don't know anything.
And the way textbooks teach sociology is quite exquisite. I'll give a marvelous
example of how you come to learn sociology. There's a line in Broom and
Selznick that goes like this: "Roles are more complex than they appear to be
at first glance." Now there's a basic sentence that you know as Members
without having done any sociology, which goes: "X are more complex than
they appear to be at first glance." And 'roles,' which first of all is a concept
that couldn't even be looked at 'at first glance,' now becomes something we
learn via that basic sentence that provides a blank for it. And you know a lot
about roles, you think. A book like this, built up out of these basic ways that
you already understand your world as a Member, and simply fits into slots,
is an especially powerful introductory textbook. But what you're learning is a
batch of terms, which you can figure you now know something about, by way
of what you already know about everything that could fit into that sentence.
But for us, the understanding and use of objects like 'X are more complex
than they appear to be at first glance' is precisely what we want to be
studying. It's not something that we can employ to give us the feeling that we
understand what is going on in the first place.

Q: How can you repeat the recognition unless there is some label to
communicate a definition?

HS: How do children learn to see 'another bird' when they saw a bird once,
or to re-see a car or a friend? It's a very obscure question, how it is that persons
learn to see generalities, or see objects again, or see 'another' of an object. I
really don't know how they do it, though it's an important thing to learn how
they do it. But they do it, and they do it with all sorts of things. You do it
with verbs, adjectives, sentences; for example, you can see "There's another
sentence." You look at them just as objects.

Now, what we're doing is developing another grammar. Right now I'm
using it with respect to verbal activities, or things like gestures, etc. And in the
same way you don't have any trouble seeing a variety of things such as birds,
or "There's another verb," you learn to see these things – at least people come
back and tell me all the time, "Oh, there's one of those things you
mentioned.' You can see it working, doing the thing it does. We want to
name these objects and see how they work, as we know how verbs work, and
that sort of thing. We want to see how activities get assembled, as with a verb
and a predicate and with whatever else, you assemble a sentence. The category
that you use to name that activity is given by the Members. They have these
category names, by and large. So what you're after is a way of describing the
activity that they have a name for.

Ideally, of course, we would be producing formal descriptions, as you
could give a formal description of how you assemble a sentence. It will not

only handle sentences in general, but it will handle particular sentences. Grammar, of course, is the model of closely ordered, routinely observable social activities.

"This is Mr Smith, may I help you?" "Yes, this is Mr Brown" was one kind of object and worked one kind of way. The way it works is the essential thing about it. There may be a large amount of things that Members can do with these objects. Or there may not be a large amount of things because someone might do something and people will laugh at them, put them away, etc. There may be lots of things that people might never do with these objects. What we're interested in is what do they do with them? Whether that's indefinite, definite, or not, is an empirical question.

We can say some of the things they may do with them. They may do other things, they may not do other things. For example, "This is Mr Smith, may I help you?" I have not seen occurring in the middle of a conversation, though "Hello" does occur in the middle of a conversation. For example, when you say "Wait I have to do something" in the middle of a telephone conversation, you may come back and say "Hello" though you'd been talking for ten minutes. So the latter has a use that the former doesn't seem to have. "This is Mr Smith, may I help you?" is strictly a greeting. The big thing is to see, what are the properties of an object which permit it to do this or that task? For example, the way the 'repetition device' works. There are special properties which provide for its use.

If you really want me to talk about what sociology ought to be about, or what relation any of these things has to what I do, I wouldn't want to do it in class, because that's like taking a position. These can't be handled seriously unless one takes them as the kinds of issues they are; like take a line out of a book and try to see how that fellow came to write that. And who knows? At least I don't know.

Lecture 5
Suicide as a Device for Discovering if Anybody Cares

I'll begin with a quotation. This is a suicidal woman, 40 years old, divorced, no children.

> A: Well perhaps you want to tell me uh why you feel like committing suicide.
> B: ((sigh)) ((sigh)) Well it's the same old childish reason that everybody wants to commit suicide.
> A: Why is that.
> B: You want to find out if anybody really does care.

There's a whole bunch of things that are interesting here, and large collections of things we have to do if we were going to be able to generate this interchange, most of which I'm not going to consider now. For example, you might look at the way this caller sets up giving her answer – by the use of "Well it's the same old childish reason that everybody wants to commit suicide" – and compare it to the A3N device.[1] That is, the A3N can provide that an account need not be produced. The sort of line this woman uses might provide that the account she is about to produce is not challengeable, needs no defending.

We might also notice how that's added to by the use of "you." That is, instead of saying "I want to find out if anybody really does care," she says "You want to find out . . . " And those usages, where a person says "you" or "one" as a way of stating something that they propose thereby to be a generally correct remark, and how they are defended, and what kind of attacks they can be subjected to, are something we can watch. And I'll deal with these matters later on.

I'm now mainly concerned with ". . . if anybody really does care" and not the particular objects by which this sequence gets done. But I do want to note the fact that this first question, ". . . tell me why you feel like committing suicide," can be asked as a sensible and appropriate question to which there is expectably or reasonably an answer – that why you want to commit suicide is something that you would have information on, or could propose to know.

A combination of Fall 1964, tape 4, side 2 and another lecture, ca. Spring 1965 ('64–'65).

[1] See Fall 1964–Spring 1965, lecture 3, pp. 23–4, above.

That the question is askable can be considered this way: Given that there are sets of question forms which Members use, one of which is "Why do you want to do X?" where 'X' is some activity, then, 'suicide' being an activity-category, just by reference to the relevance of that form for any activity, it can be applied to suicide.

How it is that such a question can expectably or reasonably be answered is worth some consideration, since for professionals there are classes of things which, if you do them or want to do them, then ipso facto you don't know why. And psychiatrists — and psychoanalysts in particular – take it that a person who wants to commit suicide doesn't know why they want to commit suicide, in the sense that the psychiatrist could say why they want to commit suicide. (And of course sometimes a person says "I don't know.") Now that fact doesn't seem to stand in the way of asking the question. And the issue then is, what's the relevance of that question, and what would happen, insofar as persons come to know what it is they didn't know? That's Socrates' classic problem; that one thing about knowledge is that you know what you don't know, and to the question "Why?" the answer "I don't know" is sort of a deeper answer; that is, it might have an awareness of the character of this knowledge as something only professionals have.

The notion of 'opinion' as contrasted to knowledge (and Plato made a great deal of the difference between them) and the sheer introduction of a notion of 'opinion,' provides in part for professionals' talk to laymen. Because one of the characteristics of 'opinion' is that it's something which lay persons are entitled to have when they're not entitled to have knowledge — in the sense that they can offer it without ever proposing to have to then defend it. Like they say "My feeling is such-and-such on that, but I don't really know," as a permissable way of talking, where one then doesn't try to find out what kind of defense you have for that statement. So in a way, 'opinion' provides for the continuing discourse between professionals and laymen. And I presume that it's a means or a mechanism by which not just psychiatrists, but perhaps professionals in general can talk to clients — by the notion of the permission that 'opinion' gives to a person to talk. That is, under the control that one doesn't really know; which is to say, one isn't entitled to know. And very frequently when you see "I don't know" appended to some statement, that's what it seems to be doing – providing that "I'm not entitled to say this," that is to say, "I can't defend it professionally," if it's a matter of professional information.

But if it's the case that there's going to be discourse between clients and professionals, or between the public and professionals, then the fact of a distribution of knowledge which provides that professionals know and laymen don't know might seem tremendously interruptive unless you had some mediating device, like 'opinion,' which would permit laymen to keep talking even when they find out that they don't know. Otherwise they might not have any way, for example, of even turning to a professional.

What I want to focus on is, why is it that suicide seems to be a way to find out if anybody does care? The question I asked when I was sitting trying to puzzle that out was, what are the available ways in this society for going about

determining that others care, or that one is relevant to others? What are the means available for seeing one's relevance?

And while I had that stored at the back of my head, I was reading one of the greatest books in the social sciences, *Witchcraft, Oracles, and Magic Among the Azande* by Evans-Pritchard. And some of his observations can begin to give us a feel for what such a procedure might look like. Here's what he reports. Whenever anything goes wrong among the Azande – if an Azande feels lousy, gets sick, injures himself, is economically in trouble, etc. – he engages in the following procedure. He pretty much drops whatever he's doing and goes off into the woods with some oracle procedure. Like, say, one oracle procedure is they take a chicken and give it a little poison and ask questions to the chicken, which the chicken answers by dying or not dying upon being given the poison.

So the Azande takes a chicken and some poison and goes off into the woods with it. And he sits down and makes up a list, essentially composed of his neighbors. He considers what his state was before he got ill, and then goes through this list of neighbors, considering about each person how he takes it they feel about his situation. Are they unhappy that he just got married that week, that he just got some wealth, etc.? By going through this procedure he then locates some persons who he figures would like to cause him trouble. And for each person that he has in this way, he offers a name to the chicken and gives it some poison. On some giving of poison the chicken will die. The person whose name was offered on that occasion is the person who has done him the trouble – caused him to have some illness, caused the rain to fall before his crops were in, caused him to have a bad hunting trip, etc., etc. And once the one who caused the trouble is found out, there is some procedure for getting amends.

Evans-Pritchard reports that the Azande just love to do this. There is pretty much nothing that will stand in the way of them stopping and going off into the woods and making up a list and sitting down and considering, for all the people around, 'How are they interested in my good or bad circumstances?' Now, this is one rather nice kind of procedure, which is institutionalized in a society, whereby persons can take an occasion and determine for themselves properly – that is, there is a proper occasion for doing it – whether anybody cares, and what they care.

Let me make a parenthetical remark about the situation of the Azande as compared with this society. One of the things that lies at the basis of the availability of that procedure for the Azande, and which is not present in this society – and which then provides that we don't do that in this society — can be stated in the following way. The Azande do not have an institutionalized notion of chance. Things like falling ill, and most particularly things like dying, do not occur by chance for the Azande. There is always somebody who's responsible. And there is a set of procedures, the purpose of which is to find out who it is that's responsible. And these are not random procedures, because one has some way of finding out, in the first place, who would be interested.

Now it's not that the Azande don't have a good notion of 'natural causes.' They are perfectly well aware of of the fact that you can get ill from natural causes. That doesn't exclude the fact that there's somebody interested in those natural causes occurring. Evans-Pritchard reports, for example, that somebody will stub their toe on a tree and then go off with their chicken. Evans-Pritchard says to the guy, "Well after all, you know, it's your fault. You stubbed your toe on the tree." And the guy says, "I know perfectly well that I stubbed my toe on the tree, and that the tree caused that trouble, but I've been through this forest hundreds of times and I never stubbed my toe before. There must have been some reason, then, why it happened this time." And that, then, provides for the responsibility. So it's not a matter of they don't have a good notion of natural causes. It's that they don't use a notion of chance.

That being so, you can come to see how rather special it must be for a notion of chance to be in fact enforced, and how easy it might be for it to break down. Because what a notion of chance involves is that something that happens to you is not a matter of inquiry as to how it came about. It just happened. You simply don't investigate why this or that trouble arises, for a great many troubles. And that might provide for people to do you ill in more or less subtle ways. The notion of chance is a pretty tender one anyway, and persons suffering various troubles in our society will often feel that they have to shed it and begin to employ, for any given trouble, the question "Who did that and why? What do they have against me?" That is to say, they no longer feel able to – or they feel compelled not to – use a notion of chance where others use it. But in this society it's not proper, and in fact it's diagnostically significant, if you do not use the notion of chance. By 'diagnostically significant' I mean persons who do not have a notion of chance are persons who have the symptoms of paranoid schizophrenia. When some trouble befalls them, they take it that it is some persons who are in the business of generating it for them.

Okay, end of parenthesis. For the Azande, then, there is a device which is routinely employable for checking out how it is that others attend to your ill- or well-being. Once we have some idea what such a procedure looks like, we can begin to consider what are the sorts of things that look like that in this society? What are the occasions under which one can make up a list like that and just sit down and consider who cares and what do they care? I think you can find that there are very, very few.

One such occasion is the wedding. Before a wedding the parents of the bride sit down with a big list and have this enormous ball considering "Would this fellow be happy that our daughter is getting married?" "How would this guy feel?" Some people give parties, they say, to occasion such a device; that is, they say "I just gave a party to see who my friends are."

But I take it that the most prominent occasion in, so to speak, a person's life, is right after they die. In this society, on the occasion of death, people gather around and talk about how important so-and-so was to our lives, how much we cared about him, how much we miss him, what a marvelous guy

this was. And that's what this suicidal woman reports. Later in the call she says:

> B: And daddy died he won't suffer anymore now the family won't be
>   aggravated And he's not here aggravating other people He was
>   aggravating everybody before he died and as soon as he died you
>   know he wasn't aggravating anybody anymore so they just said he
>   was a great guy

And anybody who's ever witnessed that scene has learned what an opportunity it is. And of course it's a well-known fantasy, seeing yourself as the one who died, getting a chance to get those credits which persons never give you and that you can't yourself collect – that is, for which there's no occasion to collect them. You can see how, for someone in pain, that scene after death — which is known to everybody as an occasion for having persons propose that they care about somebody – may then come as something exceedingly attractive, and 'the only way.' And how, then, the 'attempted suicide' can be the attempt to actualize that scene.

There are, of course, less dramatic devices for considering somebody's relevance by reference to missing them, or absences. For example, when somebody comes back from somewhere, the question is, "Did you miss me?" as a way of deciding whether it is that one cares. The question of absence and loss, then, seems to be a basic way that one has of dealing with relevance.

Now there are other, more specialized devices for doing a similar task. I'll start considering one of them in a slightly tangential way. One of the things I came across several times in the telephone conversations I've been analyzing, involved a widow or widower who was suicidal. They would say that time hangs heavy on their hands and what they find is that "nothing happens." Nothing happens to them. And I wanted to see if there was some way of finding out how that comes about; that somebody sees that nothing happens to them.

I also have conversations between young married persons. And one of the most exquisite kinds of things that young married persons do with each other is, they say things like, "Kennedy was assassinated two weeks after we got engaged." I want to give the name 'private calendars' to that sort of talk. And I want to note that married couples, each one, by themselves, independently, construct these private calendars. And what private calendars do is to provide for the locating of, not only events within that relationship, but events of the world in general, by reference to the relationship.

Further, these calendars are 'causally powerful.' What I mean by that is, there are all kinds of events which can be explained by reference to the relationship. There is a generic statement: 'Because A did X, B did Y,' where one can substitute for A, 'wife' and for B, 'husband,' and substitute for Y the event to be explained, and for X the activity which can explain Y. This provides a large class of sensible statements which persons in units like

husband–wife are able to employ. Indeed for many events, such statements *have* to be employed; that is, for many events, such an explanation is the only sensible explanation. So it's often said that while you can give a whole list of explanations for why it is that somebody succeeded, in the last analysis it's because of his wife. It's said without knowing the guy, or knowing anything else.

Another sense in which the private calendar is causally powerful can be seen in the paradigmatic statement, "That was before I met you and I was lonely then." There is a class of logical statements which the logician Nelson Goodman named, and pointed to as creating very basic problems for the philosophy and logic of science. He calls them 'counterfactual conditionals,' of which an example is, I think, "If one had lowered the temperature to such-and-such a degree, then the following would have happened," where one hasn't lowered the temperature and the thing hasn't happened, but one has done something else and something else has happened. Many scientific statements are made that way, and Goodman argues that there isn't currently a logic providing for them. But counterfactual conditionals are nonetheless routinely used, and they are, nonetheless, enormously powerful. Which suggests that perhaps a logic can be invented, or that they're building on something very strong.

Many uses of the private calendar are such uses. See, one of the problems in developing a relationship is finding out that the states of the person you're with are to be accounted for by *you*, and not by the sheer fact that they're with somebody. That is, they want to be able to say that even if they were with somebody before, they would still have been lonely. And that's one wants to do with these private calendars. They're ways of building up, in deep and repetitive ways, the relevance of 'you.' And perhaps one of the big things about marriage is that that's just what you're constantly doing for each other. The notion, for example, that marriage is made in heaven, is kind of an underpinning to the use of these things. That is, it's an account that would provide the basis for saying "That was before I met you and I was lonely then." Our meeting was virtually guaranteed, and it's just a matter of, until then one drifted, and now it happened. By virtue of this causal structure, of course, persons who are members of such units have built-in procedures for finding that someone cares. And for a lot of things it's the only way you can find the sense of what's going on.

Let me point out something about the private calendar that turns out to be rather important. I don't have a very large set of features of these things, but one thing I have found out is that if we compare these private calendars to everybody's calendar, then there's one striking difference between the two of them. And that is, everybody's calendar has, and private calendars do not have, guaranteed continuity. Everybody's calendar runs on into the indefinite future, without regard to anybody in particular being present. Private calendars end when 'we' end. The end of a relationship, in one way or another, can provide that there's no more events on the private calendar.

Now then, what we can see the widowed person saying, when they say

"Nothing happens anymore," is that with regard to the private calendar whereby events between me and my spouse happen and the value of my life is found, no more events can occur on it. You can get, then, a sort of task that a therapist, or somebody else to whom one of these persons would turn, might have. The task is at least programatically simple, whether it's easy to do is another question. It involves bringing them back to the use of everybody's calendar, whereon events can still occur sensibly in their lives.

I'll add another thing, and this is somewhat more conjectural, though not strictly made up, and it may be relevant for our materials here. For widowed persons, the fact that they've had a life with somebody is something that the other's death doesn't take away. And they can say "We had a marvelous 25 years together," pointing to all the things we did together, how it is that I was happy on this day because of what he was doing, because we were together, etc. Now, when persons get divorced, something quite different seems to operate. Apparently a divorce can provide for the fact that one can't even retrospectively use the private calendar one had going. The fact of a divorce, perhaps with the reconsidering of whether one ever did care, and what after all they were doing these last five years that led up to this, seems to involve that one can't then use it for the past that one was 'together.' That the woman in our materials is divorced may then not only provide that she has no current access to the built-in procedures for finding that others care which such a unit as husband–wife provides, but also that she is deprived of whatever retrospective use she might have had of that unit's private calendar.

Via this sort of a sketch we can begin to see where the relevance comes of having others care. And that is that the whole class of causal statements that are built out of such units as husband–wife and the relationships between categories in these units, provide an apparatus in which everybody is supposed to be entitled to become a member of such a unit and thereby to have these things done for them. And if they don't become a member, given that they're entitled to become a member, they have a clear way of seeing that something is missing. It's not the easiest thing in the world to find a way to say that something is missing. But if you have some objects for which there is no rule of exclusion in the first place – everybody is entitled to them – then if someone doesn't have it at some point that one is entitled properly to have it, one can say that it, and its consequences, are missing.

We can tie this up to some extent by asking what, then, is the consequence of not having persons care? Well, these lay theories – and all these causal statements and entitlement propositions are lay theories – have a rather interesting property. If you consider our prototype of a scientific theory, then, if some object doesn't conform to what the theory proposes about the object, then the theory has to be revised. This world has been constructed in a rather more exquisite way. What goes on is the following. A large class of lay theories are properly called 'programmatic theories.' If they don't describe your circumstances then it's up to you to change. And if they don't provide for you as a Member, then it's up to you to rid yourself of being a Member, for example to kill yourself. In that way you keep the theories going as descriptive.

If you're a member of one of these units you have essentially automatic ways of finding that others care. It's built into the structure of ordinary discourse, and the way persons see how events come off. If you're not a member of such a unit, it's still relevant, but its structure is not available to you. And you may then try that procedure which works for everybody – dying – either as a way to find that somebody does care, or as a way of providing that the theory that people ought to care is made correct by virtue of your no longer being a Member. And we'll see constantly that persons talk of a whole range of things where if something is not so for them, then that doesn't provide that what's supposed to be so is thereby wrong, but that they're wrong.

Let me add one more device relevant to "Does anybody care?" It is, of all things, trash mail. The next time that they have hearings about removing trash mail, I'm prepared to go and testify against its removal. Because trash mail is a most interesting thing. I've mentioned this woman who used to go to the park and sit and talk to people. Many of those were old ladies. They were all utterly isolated. They came to Los Angeles after their whole family died, or they came with their husband and he died. They live in apartments near a park and they spend their day in the park. But they regulate their lives in most interesting kinds of ways.

Even though they have almost no money they, for example, never purchase at supermarkets and never purchase more than a day's food. Because if they did, they'd have nothing to do the next day. And they routinely will get up – you'll be sitting in the park talking to them, the only person who's talked to them since God knows when – they nevertheless get up and say "It's 11 o'clock, I have to go home and check the mail." Now there's nobody who's writing to them. What it is, is that there's that trash mail coming, and that's something.

Consider their situation: The mailman comes every day, and they know it. And that means that for them, they have to go check the mail every day. The only mail they do get is this mail that everybody gets. But for them, it's something. And if they had to recognize that he would come every day, and every day they would find no mail, and they could look forward to that day after day, then that situation of theirs, of isolation, would so be built into their circumstances and shown to them routinely, that it might become far more unbearable than it is – and it's pretty unbearable – because this is a device that happens every day, for whomsoever. You don't know who is getting telephone calls, you don't know how many phone calls are being made, but every day, everybody has the mailman go by. And if you just consider the comparative cost of trash mail versus an enormous mental health operation, then trash mail is not expensive. And for these people it's by and large the only means by which the routinely-used device of delivering mail does not become the kind of thing it would otherwise become – this persistent statement to them that nobody cares.

Lecture 6
The MIR Membership Categorization Device

I'll begin now talking about some very central machinery of social organiza-
tion. Let me indicate how I came by the findings I'm going to present. In
dealing with first conversations I've very frequently found, as anyone can
easily find, that especially in the early parts of these conversations certain
questions are prominent; questions like "What do you do?" "Where are you
from?" etc. I wanted to see if there was some simple way that I could describe
the items that those questions contain, so as to provide for their occurrence by
rather abstract descriptions. That was the initial task. Its consequences are
rather powerful, and I'll develop them as I go along.

It seems that there is *a class of category sets.* By 'category sets' I means just
that: A set which is made up of a group of categories. There are more than
one set, each of which can be named, and they have common properties. And
that is what I mean by referring to them as a 'class.'

A first thing we can say about this class of category sets is that its sets are
'which'-type sets. By that I mean that whatever number of categories a set
contains, and without regard to the addition or subtraction of categories for
that set, each set's categories classify a population. Now, I haven't made up
these categories, they're Members' categories. The names of the sets would be
things like sex, age, race, religion, perhaps occupation. And in each set are
categories which can classify any member of the population. I call them
'which'-type sets because questions about any one of these can be formulated
as, "Which, for some set, are you?," and "None" is not a presumptive
member of any of the categories. And that would suggest what it is that
provides for such questions occurring at the early part of first conversations:
You don't have to know anything about somebody to be able to formulate a
set of questions for which "None" is not an expectable answer. And of course
for some of the sets you don't have to ask the question.

A second thing we can say about this class of category sets is that its
categories are what we can call 'inference rich.' By that I mean, a great deal
of the knowledge that members of a society have about the society is stored
in terms of these categories. And by 'stored in terms of' I mean that much
knowledge has some category term from this class as its subject. And the

---

A combination of Fall 1964, M1, sides 1 and 2, and Winter 1965, lecture (4–5)
(transcriber unknown). The discussions are the same in both sets but are more formal
in the latter, and much of what is shown here is taken from the more formal version.

inference-rich character of these categories constitutes another warrant for their occurrence in early parts of first conversations: When you get some category as an answer to a 'which'-type question, you can feel that you know a great deal about the person, and can readily formulate topics of conversation based on the knowledge stored in terms of that category.

A third feature is that any member of any category is presumptively a representative of that category for the purpose of use of whatever knowledge is stored by reference to that category. So, for example, a foreigner comes to the United States and you find yourself asking them about the political situation in Ghana, or how they like the food in the United States, without reference to whether they stand as a member of the Gourmet Club of France, or don't ever eat out, or aren't interested much in food, or are just ordinary citizens, so to speak. But one finds that it's done. And it's done for any of these category sets.

Let me emphasize that we're dealing with categories, and not necessarily with what sociologists might call 'groups,' 'organized groups,' 'organizations.' It's quite important to see that presumptive representativeness holds whether or not the members of that category are or are not organized. If they are organized, it holds whether or not they choose their representatives. The fact that they are organized and choose their representatives does not mean that one cannot apply the knowledge stored about such a category to persons who are not selected by the group. And, furthermore, the fact that it is not a group in the sense of being organized, doesn't mean that one cannot apply such knowledge.

I'm calling this whole apparatus the MIR device. And that is an acronym. 'M' stands for membership. 'I' stands for inference-rich, and 'R' stands for representative. That's the core of the machinery. I take it one can readily notice how absolutely central this is, for a vast amount of stuff is handled by Members in terms of the categories that it locates and the way it locates them, and the activities that those categories are used to handle.

Now one might get a sense here of a certain problem, and I'll mention it right now. I take it to be a central problem of sociology, and I'll try to show some sorts of solutions to it eventually. The problem is this: There are these category sets. For any person being talked of, how is it that Members go about selecting the set in terms of whose categories that person is going to be talked of? It's perfectly obvious that there is a range of sets whose categories could be used; from the set 'sex,' "a woman". From 'race,' "a Negro." From 'religion,' "a Catholic." From 'occupation,' "a psychiatric social worker," etc., etc. Each of these categories could apply to the same person. And it's perfectly obvious that Members do use one set's categories for some statements and another set's categories for other statements. If we're going to describe Members' activities, and the way they produce activities and see activities and organize their knowledge about them, then we're going to have to find out how they go about choosing among the available sets of categories for grasping some event.

All the sociology we read is unanalytic, in the sense that they simply put

some category in. They may make sense to us in doing that, but they're doing it simply as another Member. They haven't described the phenomena they're seeking to describe – or that they ought to be seeking to describe. What they need to do is give us some procedure for choosing that category which is used to present some piece of information. And that brings us back to the question, are there procedures that Members have for selecting categories? One of my aims is to show that there are.

For now, let me show one of the tasks this MIR device, in combination with a particular sort of operation, can be involved in. I'll be talking now about some extremely basic and extremely generic social control devices. The particular sort of operation consists of one way that Members go about making new knowledge. Suppose some event occurs and is known about by reference to the name of the person who did it. The way you get a piece of knowledge involves pulling out the name and putting in some category. Then one gets, not 'John did X,' but 'a such-and-such did X.' In that way one gets additions to any given body of knowledge about such categories. And what we find is that an enormous amount of what we could call the lay theories of social actions are fitted onto these categories.

Given the MIR device, and given this operation whereby new knowledge is formulated – by replacing a name with a category – we can begin to see how a class of social control devices gets set up and is used. It has as its basis that members of the society are constantly engaged in monitoring events; on the one hand by reference to whether something that has happened is something that they're accountable for, and on the other hand, to find out what is getting done by members of any of the other categories.

Apart from the routine monitoring terms of these categories, we get nicely special kinds of occurrences which provide a beautiful view of tensions arising as persons await the discovery of which of them is going to be found to have done this thing. For example, the hours between the assassination of President Kennedy and the determination of who it was, and thus what category it was that performed the act. If you have access to a variety of materials from that time, you can see persons reporting themselves going through "Was it one of us right-wing Republicans?," "Was it one of us Negroes?," "Was it a Jew?." etc. That is, "Was it me?" in that sense.

This sort of monitoring makes for great sophistication in kinds of ways of doing trouble. For example, in the recent Russian economic trials, it was quite sufficient for those who were encouraging anti-semitism in Russia, to simply publish the names of the persons who were tried. The names turned out to be seeable as belonging to Jews. And you could leave the rest to everybody's routine procedures: "See? Jews are economic criminals, as everybody knew."

What you get then is a whole series of teachings, all of which have the same form: "Remember you're a such-and-such" (a lady, an American, a Negro, a Catholic, etc.). That is, any action you take is exemplary. Any action you take is something we're going to have to come to terms with. Such teachings belong to a class of activities which are often called 'internal systems of social

control.' They may be informal or formal, but they're not like such things as, for example, a government. What they have in common is that they are all operated by and enforced by and taught by and used by members of the category whose members are to be controlled.

These internal control devices all seem to be built on, and have their power by virtue of, this very simple apparatus the MIR device, which is utterly disjunctive to whatever these groups happen to be, or whether they happen to be 'groups' in the organizational sense of the term. Indeed, some of these classes' categories may set out to become organizations by virtue of the uses that are being made in any case of their categorial membership. It is no mere plea, for example, that women have got to get organized. If an event occurs where what somebody does is seen by reference to the category 'female,' then women in the society find themselves constructing explanations for how it would have happened, or proposing that they can't figure out how such a one would have done that – though of course they need know nothing about the person except that category of membership.

To get some contrast on these control devices, we might notice that they're much unlike a characteristic thing to which we give the name 'scapegoating.' In scapegoating, if a member of a group does something which is sanction-able, then either that member or some other member of the group may be selected by some procedure – perhaps the group itself selects them, perhaps an outsider selects them – and a sanction is applied to that person or persons. That being done, guilt is purged. This doesn't happen. If somebody does something that is formulated as an action of the group, then a piece of knowledge is thereby legitimately usable and you don't have some procedure for cutting off its use – such as the scapegoating procedure – where it's thereafter not proper to say about a group that they did this thing. So, Members' stake in the actions of other Members is not conditional in that sense; that is, it is not conditional on being or not being purged.

Now, given what I've said so far, there are certain things that can be examined pretty clearly. One of them has to do with a situation where some person who is a member of some category does something to another person, where that other person happens to be a member of the same category. The pain of it, that it's something awful, operates not merely by virtue of the fact that somebody did something to you for which you have some legitimate feeling of being injured, but in addition you have the sense of having injured yourself. And in such cases people talk of being ashamed of being a member of the category they're a member of.

So, for example, I have materials in which a person in one or another trouble will call the social agency of their religious denomination (Catholic Family Service, Jewish Welfare Group, etc.), and get rejected. I have two cases in which such a person subsequently calls someone else and is reporting this. And in each case they report – as is not reported when persons are rejected by, say, a municipal agency or some hospital – "It's not just that I was rejected by somebody, but I feel ashamed of belonging to a group that does that to people." That is, impersonally they are now observing the group

in operation, where they take it that whoever it was that spoke to them is a representative of the category (Catholic, Jew, etc.), and that such a one did something to another is something that reflects on themselves and devalues their membership. That is, not only non-members, but members of a category take it that the actions of that category can be assessed. It's not merely that a non-Catholic could hold this up and say, "See? Catholics don't take care of their own," but that a Catholic will say, about their own group, the same thing. The generic importance of such a phenomenon is that it's not just one category's view of another, but that knowledge is standardized across the categories.

I want now to notice several affiliated features of the MIR device. I'll start off with a feature I found in a few pieces of conversation – and indeed it was looking at these materials that really launched a lot of the considerations here. First I'll show the materials. In the first extract, two teenagers, a fellow and a girl, are talking about dating.

> *A*:   Corliss the g– this chick that I'm hanging around with now, she's real nice she's got a real good personality, she's not– you know she's //
> just a real cute little kid.
> *B*:   Mm hm,
> *A*:   And last night we went to the Mardi Gras together and we were both well we were both pooped because I–I ran in the track meet yesterday. And she–she's in the girls' tumbling team. I mean she doesn't like it she's just on it because she needs the credits.

The second is from the emergency psychiatric hospital.

> *A*:   How old are you Mr Bergstein?
> *B*:   I'm 48, I look much younger. I look about 35, and I'm quite ambitious and quite idealistic and very inventive and conscientious and responsible.

What struck me was that a thing was presented, "She's on the girls' tumbling team" and "I'm 48," and then you get a modifier in a long or short statement. At this point in our considerations I take it that what we have here is very apparent. For some category, like these two, there is a set of things known about a member which can be applied to any member, for example that being on the girls' tumbling team is presumably something very gauche, and that someone who is 48 is past their prime, which any person now talking about such a category membership has to come to terms with.

So we have a class of things, these modifiers. And they consist of attempts to provide that what it is that may be said about any member is not to be said about the member at hand. "I'm 48 but I look and feel younger," "She's on the girl's tumbling team but . . .," "He's a Negro but . . . ," etc. Having seen this, I think we can see a solution to something I had been puzzled about for quite awhile. It is, I suppose, a rather minor kind of interest, but it's

related to just this business. There is a class of what look like tautological statements, "Women will be women," "White folks is white folks," a whole large bunch of them. It looks like they are simply tautological statements; that is, that they say nothing. But given the use of MIR modifiers, these tautological statements seem to be – to use an awkward phrase – 'anti-modifier modifiers.' That is to say, under a condition where for some reason it's proposed, or one has been going along under the notion that, the person whose behavior is being considered is to be classified by reference to one of these modifiers – for example, "He's a Negro, but the things you can say about Negroes you can't say about him" – you have this other class of statements available to flip in and provide that in the last analysis he's like the others. They provide for the re-relevance of whatever it is that's known about the category. And if you watch conversations in which these things occur, that's the way they get used.

In certain kinds of relationships these anti-modifier modifiers can be extremely deadly kinds of things to have around, because they can always be used in the following way. There is the kind of relationship that proceeds between some set of persons under the modification that what is known about the category that one of them is a member of, is not to be applied to this one. And now the one who is living under that modification has always to carry the possibility that some time somebody is going to say, "Well, now it really comes out . . ." and invoke a set of things that can properly be said about that category, removing the modification under which they've been living.

There is another feature I want to mention. Some of the category sets of the MIR device have to be differentiated from others in some special ways. If one considers categories like age and social class, in contrast to those like race and sex, one finds some rather interesting differences. For all of them there may well be a stable set of categories used by everybody. But whereas for, say, sex and race it will be by and large the case that one can take it that whatever category somebody applies to somebody else or to themselves, anybody else would apply that category, that is not so for categories like age and social class. What you have with these latter sorts of categories is a rather lovely series of things going on. If any Member hears another categorize someone else or themselves on one of these items, then the way the Member hearing this decides what category is appropriate, is by themselves categorizing the categorizer according to the same set of categories. So, if you hear B categorize C as 'old,' then you would categorize B to decide how *you* would categorize C. And again, the same procedure works for such a thing as social class.

This sort of operation is probably basic to something which sociologists are talking about as a generic matter (but which is by no means generic) and which Members also use. And that's the notion of 'perspective.' If somebody calls somebody 'old,' what you want to know is, how would you call the person who called the person old? That way, even if you don't know the person being categorized, you can have, for example, some notion as to the range that's involved. If you're an adult and it's a ten-year-old who calls somebody old, then you can figure that the somebody could be anywhere from 20 on up;

that is, they're possibly young. Now it may well be, though I can't say this with any confidence, that even though this sort of business is going on, it's largely the case that the same information is stored for any category. So that A and B, being from different categories, may place C in different categories (A categorizing C as old, B categorizing C as young). But whoever A and B would place in the same category (whoever A might call old and whoever B might call old), they would say the same things about that one. So that when kids talk about 'old people,' though they're talking about somebody who is 20, they may have the same information about that one that a 30-year-old has about someone who is 70.

It may not be the case, then, that on the different 'perspectives' – that is, on the different uses of the categories – depends a whole different body of information, but that the knowledge is stable for any category like 'old.' It's just a matter of what category is using the term 'old.' The same thing may work for social class. For these, there may be no position that provides for the definite classification of somebody. One wouldn't then find that somebody carries around an identity which is stable for any environment they come into; for example, that they would be 'old' no matter who it is that's around them. Nor would it be the case that for each of the persons around them they would be seen as the same person that they have to see themselves as. There is no supposition of agreement on any categorization for such persons all categorizing each other.

Let me mention another minor thing which this machinery can clarify. Where it might not be proper to say certain things about another person, or for that matter about oneself, what one can do is to propose membership in some category, where that category stands as the adequate basis for inferring those certain other things. So, to take a sort of extreme example, here is a first conversation between a psychiatric social worker and a suicidal man. Earlier the man had said that he's been married three times, he's not working and not married now.

A: Is there anything you can stay interested in?
B: No, not really.
A: What interests did you have before?
B: I was a hair stylist at one time, I did some fashions now and then, things like that.

They go on for a couple of minutes. Then:

A: Have you been having some sexual problems?
B: All my life.
A: Uh huh. Yeah.
B: Naturally. You probably suspect, as far as the hair stylist and, uh, either one way or the other, they're straight or homosexual, something like that.

In this case, while it might not be proper for this man to say about himself that he's troubled by possible homosexual tendencies, he finds a way to invoke a subset of occupational categories, "hair stylist. . .fashions. . .and things like that," which constitutes an adequate basis for inferring homosexuality. And in his subsequent talk he proposes that such an inference has "probably" been made by the other. Apparently, then, there are ways of introducing a piece of information and testing out whether it will be acceptable, which don't involve saying it.

Now, I have by and large been talking about negative information stored in these categories, but they obviously provide that system of rewards which any young person can expect by virtue of becoming a member of any category that they can become a member of – for example, occupation, or changes of religion – since to become a member is to make stateable about yourself any of the things that are stateable about a member. So they're the basic system of incentive for persons to do a variety of things. That's now fairly well known, so all the various occupations are engaged in trying to sharpen up their images so as to make it attractive for persons to come into them.

Also, there are paths that can be constructed in terms of set movement, which persons may use to consider what their likelihoods are of ever getting to be a such-and-such, given that I'm a this-and-that. And the fact that 'somebody has made it' provides a path. But this can be used in very negative ways just as well. For example, I heard on the radio the other night an interview with congressman Billy Mills. And he was asked, "Well, you're a Negro, you came from the lowest part of the economic structure and nonetheless you've made a great success, why can't any other Negro do it?" That is, there is a path which your history has laid out. Why does that not stand as a way to get from one place to another which any person in your initial state can use? And now Mills has to come up with some argument about why it couldn't or shouldn't. Or, for example, the notion of 'token integration' can be used in business establishments in just that way. The fact that there is a such-and-such at this place provides that there is indeed a path from the position they started with. And since there is a path, and since Members at that initial position know how to use it, the burden now lies on them to do so.

Finally, let me offer something to consider. I have no idea whether it's so. It sounds altogether too smooth to me, and nonetheless it also looks, on the face of it, to be very descriptive. Many of these classes are, or can be built as, two-set classes. Sex is a two-set class. Race can be formulated as a two-set class; for example, non-whites and whites. And there's rich and poor, old and young, etc. The question I'm asking is, does it matter, for the *kinds of things* that can be done with these classes, how many sets they contain? Two-set classes would seem to have certain kinds of attractions. For example, they're tremendously easy to compare. With a two-set class you can apparently make an observation of comparative lack much more easily than otherwise. And I wonder, for example, whether many kinds of conflict and perhaps most sorts of revolutions occur by virtue of these two-set classes; as we say, the haves and

the don't haves. Under such a view, you can see all sorts of different things being fitted to the notion of haves and don't haves. Marx can be seen to have used this two-set class. The movement for equality of women can be seen to be using it. And the Negro revolution as well.

To establish a two-set class you might start with one group who you locate as the group in power, or the haves. Give them a name: Whites, men, the old. And then assimilate all the others to some predominant feature of those others; for example, a lot of them are Negro so you call it 'the black revolution.' But if you just go through the ways revolutions tend to organize themselves, or the ways movements tend to organize themselves, or notice that games – which are model conflict situations – are so often either two-party systems or variants of two-party systems, it begins to look as though formulating in terms of two-class sets is a method of doing things. Whether this is so or not, I haven't the vaguest idea and it needn't be taken with any seriousness. But what I said earlier, about this device as a basic mechanism of social control is, I think, important. If we can come to see what's involved in it, I think we can see something useful, and something that's of theoretical importance in sociology.

Lecture 7
On Questions

A few days ago I asked people to go out and collect first lines of 'pickups.' I did that because I want to return to some considerations of rules of conversational sequencing, and to introduce a rule. But it has initially such a vacuous sound to it that I wanted to see if there was some way of making its relevance clear, more quickly and more intimately than the materials I had on hand permitted. Looking at my materials, these long collections of talk, and trying to get an abstract rule that would generate, not the particular things that are said, but let's say the sequences, or their continuity and things like that, then you come up with a rule that says something like: *A person who asks a question has a right to talk again*, after the other talks.

That sounds enormously empty. One reason it sounds empty is, at this point I can't put in ". . . after the other answers." I can't put it in, in part because 'questions' and 'answers' are in some ways altogether different objects. For example, a question is a grammatical matter and an answer isn't. I don't think you can locate 'an answer' grammatically. Also, a question can be paralinguistically described. An answer doesn't have that character. That is, if you play a tape or listen to a conversation and forget about what's being said but just try to get the tone, pitch and that sort of thing, then you can describe what a question looks like. A question has a form. And an answer doesn't, apparently. So we can talk about 'asking questions' and identify some object as 'a question,' but we can't do that very much with 'an answer.'

But anyway, there looks to be a rule that a person who asks a question has a right to talk again afterwards. And that rule can provide a simple way of generating enormous masses of sequences of talk: Question, talk, question, talk, etc., etc. We can say it's a rule with a repeat device. But what else can we get from it? About 60 first lines of 'pickups' were handed in. Seven of them were other than questions. More than 50 were questions. And by reference to this rule, that wouldn't be an incidental fact. You might begin to see why questions get used.

Here's a classic Yiddish joke on just this issue. A young man gets on a train and sits down next to an older man. The younger one asks, "Can you tell me the time?" and the older man says "No." "What do you mean no?" the younger one says. The older one says, "If I tell you the time we will have to get into a conversation. You'll ask me where I'm going. I'll ask you where you're going. It will turn out we're going to the same place. I'll have to invite

you for dinner. I have a young marriageable daughter, and I don't want my daughter to marry someone who doesn't wear a watch."

I'll make something of an excursion and talk a little bit about pickups. Let me sort of mock one through; one that I saw at the airport. A bunch of about 20 people are standing around waiting for a plane to arrive. At the edge of the crowd a girl is standing. A guy comes up somewhat behind her and says, "What time does the plane arrive?" She turns and says "In 20 minutes" and turns back. Then he asks another question. She turns, answers, turns back. This goes on for five or six questions. Then she just turns her body to him, without especially any expression, or even looking at him. He keeps asking questions. She keeps answering them. She turns her head up when she answers and then brings it back. So it looks like if at any point he was to stop, that would be that. At some point she takes out a cigarette and he lights it.

Now, it's a very well known fact about homosexual society that in bars frequented by male homosexuals the bartender keeps a pack of matches behind the bar because it's impossible to ask for a light. That is to say, asking for a light is so much a 'move' that if what you want is just a light, you just pretty much can't do it. It also seems that between males and females, asking for a light is a tremendously sexual thing to do. In any case, in such things as pickups it's a key point. And I don't think that's incidental. There are a series of areas which are closely regulated, especially between persons who don't know each other, which lighting a cigarette can be involved in.

First is eye-to-eye contact. If, for example, you sit in the library and have somebody sit opposite you watching you, you can get the following results. You start to look at somebody. You'll find that even when *you* can't tell that the other person has caught your glance, the person sitting opposite you can – and they're not looking at the other, they're just looking at you. Your eyes flick, like magic, across the room. A glance just drives them away. So eye-to-eye contact is a highly regulated thing. But of course when a person lights a cigarette for you, that's an occasion for persons to align with heads very close to each other, looking at each other directly.

A second thing is touching; a very closely regulated matter as between persons who don't know each other, and even between persons who know each other. But again, lighting a cigarette can be an occasion for taking someone's hand, for example. In any case, some touching can very easily go on.

It's also a point when business is being done between the persons such that they're not talking and nonetheless together. Whereas previously, every time they stop talking there's an issue about whether they are together. But here you have a first occasion when the persons can stand together, looking at each other perhaps, without ever saying anything, and pick it up again. And the development of the ability to have a pause in a relationship is very crucial. Just remember, for example, when we were very young, going out on dates for the first times, how it was that gaps in conversation were treated as such tremendously painful things. The developing of an ability in a relationship to be silent is a very important thing. And this is a first step to that.

Another thing this act of getting a cigarette lighted does – this is of course

completely apart from anything like psychoanalytic theories about cigarettes
– is that when a woman has a cigarette, she has an occasion to be moving.
You don't smoke a cigarette with your hands at your sides. And, for example,
as the cigarette is lighted for her, she can bend her head and look up through
the top of her eyes – which is in our society a very sexual kind of way to be
looking at somebody. And when she has a cigarette in her hand, she has then
a routine opportunity for bringing her hand to her face, which provides the
minimal condition for him to be looking at her face; that is, it's perfectly
legitimate to follow a moving object, your eyes do it normally. So she can
begin to get into physical action, moving her head and her arms, etc., which
then provides for, literally, a dance.

That ends the excursion. I wanted to give some idea about the relevance of
this rule that if you ask a question you have a chance to talk again afterwards.

Now, there are some situations which have their particular character by
way of the fact that this rule *doesn't* hold. The easiest one to get examples of
are Presidential press conferences. A bunch of reporters are in, say, the State
Department auditorium, and one of them is pointed to. They can ask one
question. Then somebody else will be pointed to. This isn't so for Johnson's
recent conferences because he's been doing them informally; people wander
around together. And there it seems to be permissable for a fellow to ask a
second question, a clarifying question. But in general, you could take the
Presidential press conference as one extreme: You only get one question. One
thing you could then do is move to the other extreme: Places where one has
an enforced right to ask further questions, a right which is not violatable by
the person who is answering – cross examination, for example. Then you
could try to see what questions look like under this or that control. For
example, do they have a different shape? And what's the position of either the
questioner or the answerer in each situation?

Here's one of the problems for a questioner at a press conference. Persons
come in with questions. They all move to be called by doing various things
– standing up, waving their arms, getting front seats, wearing odd clothes,
etc. One of them gets recognized. He asks a question. An answer comes out.
If he had an opportunity to talk again, he might want to push further on what
that answer suggests. But he can't. Somebody else is now called on. Now their
problem is, they may know that there's a good question one could make up
to follow that one. But if they follow that one, what happens to their
question? They may have come with something of particular interest to their
area, "What's your policy on Idaho potatoes?" They want to get that out. But
what's just been raised is something about the defense policy, which is a
generally important issue. Should they ask their question or the follow-up
question? They won't get another opportunity. Now for some questions
they've brought with them, they can know that these are so topical that
another might well raise it, and they can 'sacrifice' their use of it to doing
what's in the interest of the press conference; that is, asking a follow-up
question. But of course the President has some control over what questions get
asked in the first place, because he will have some pretty good idea about

what various persons might be interested in asking. (Kennedy apparently sometimes gave them the questions, or they told him what they were going to ask if they were recognized.)

Another sort of problem for a questioner at a press conference is that the answer might be nothing more than a "Yes" or "No." Or, for example, the Kennedy format, responding to a question with a quip. And that in its way is akin to "This is Mr Smith may I help you?" as a way of getting the other's name without saying "What is your name?" and also akin to laughing when someone says "I'm going to kill myself" as a way of refusing to give help without saying "I won't help you." The Kennedy quip is a way of refusing to answer a question without saying "I'm not going to answer that question." Because after the quip, the fellow who asked the question can't come back. And whether anybody else will come back to it remains to be seen.

What might stand as a solution to this problem was something that was noticed when they were thinking of televising the press conferences. One of the matters that arose was, if they televised these things, people would ask very long, involved questions to get themselves time before the audience. Then it was realized, well they do that anyway. Now the question is, what are these long involved questions doing? One thing they might be doing is this: You try to ask a question, providing in the question for a sub-answer: "Would you do so-and-so or not, and if not, then . . . ?" That is, you'd want to provide that he could not just say "Yes" and you wouldn't have anything, but "If 'yes,' then is such-and-such relevant, and if not, is such-and-such relevant?" These sorts of questions sometimes get so involved that after one of them the President says "Well you've made your point, thank you." Because it looks like a speech. Now that elaborateness may not be so much due to the guy's being on television as to his having to make a question under this constraint of not having a second chance, to ask for a clarification of the answer or to pose a follow-up question. You have to try, then, to build the one question to do that job, whereas in other situations you can just ask them piece by piece.

So we can begin to see how things might look different by virtue of the presence or absence of the rule and how strongly that is enforced. For example, in cross-examination the presence of the rule is strictly enforced. You're sworn in and you stay on the stand until the guys says "No more questions". You can't say "Well that's enough, don't bother me anymore," which you can do in ordinary conversation. And, for example, in ordinary conversation you can produce an answer, append to it a question, and now take over. The roles are not set so that one is 'a questioner' and one is 'an answerer' from now until the end of time, or from now until the end of this interchange. So something as limited as this rule can have rather considerable and observable consequences.

I'm going to introduce another rule. I'll start out with some quotations.[1]

---

[1] Cases (1)–(4) are from Sacks' research notes. He often put big blocks of data on the blackboard, usually reading it out. He does not do so this time, but he refers

(1) *A*: Do you have any physical problem? Any illnesses?
  B: No. Just a little bit (   ) and overweight.
  A: Overweight?
  B: Just about 20 pounds.
  A: Now when you get depressed, how is your appetite?
  B: It's usually always good. No when I'm depressed I don't feel like eating, I can't eat.
  A: And how do you sleep?
  B: Alright, but not as much as I'd like to.
  A: That happens. Do you lose much interest in sex when you're depressed?
  B: Well, just in everything when I'm depressed.
  A: Now, right now you're feeling a little better.
  B: Yes.
  A: But you figure on past experience that you might become depressed again any time, like tomorrow.
  B: Yes.
  A:→Well, it certainly sounds as if you need some help, and there are many things that can be done for this.

(2) *A*: Are you working?
  B: No I'm not.
  A: Your husband supports you?
  B: Yes.
  A: Well, what do you do with yourself?
  B: Oh, I have a lot of interests. I work with theater. I do, oh, little community theater direction and things of this order.
  A: Do you find there are times when you lose interest in it?
  B: Yes. Very d– I find there are times when I lose interest in everything and there have been times when I have stopped speaking for days.
  A: I don't know anything about your sex life now, but are there times when you lose interest in sex?
  B: Yes. Completely so.
  A:→Right. Sounds pretty clear cut as a depressive illness.

(3) *A*: Hello, this is Mr Smith.
  B: How does the Emergency Psychiatric Hospital work out?
  A: How does it work out?
  B: I mean what do you do. I'm sure a telephone conversation wouldn't save me.
  A: Well, it sometimes is a first step in the process, going a very long way in being helpful.

---

to the materials in such a way that at least two of them can be located with some certainty, and the other two stand as decent instances of what is being talked of in the lecture.

B :   A first what now?
A :   A first step.
B :   In a telephone conversation. Then what's the next step?
A :   Well, we would If it's a problem involving suicide we would invite you to come in for an interview, explore the problem more fully with you, and then see if we could recommend something helpful.
B :→It sounds too slow.
A :   What's that I'm having difficulty hearing.
B :   I said it sounds too slow.
A :   Too slow, we can act very rapidly when the need arises. Are you a person with a suicidal problem?
B :   Yes.
A :   Could you tell me something about it?

What we find in these exchanges is that the person who is asking the questions seems to have first rights to perform an operation on the set of answers. You can call it 'draw a conclusion.' Socrates used the phrase 'add them up.' It was very basic to his way of doing dialectic. He would go along and then say at some point, "Well, let's see where we are. Let's add up the answers and draw some conclusion."

And it's that right that provides for a lot of what look like strugglings in some conversations, where the attempt to move into the position of 'questioner' seems to be quite a thing that persons try to do. (We can just note that in our third exchange there's a shift in the middle, A, the answerer, appending to his answer a question, which B answers, and then a next question.) As long as one is in the position of doing the questions, then in part they have control of the conversation.

Now, we do find questions followed by questions. For example, you can propose a request for clarification of the question.

(4)   *A* :   This is Mr Smith. May I help you?
      B :   Yes, I heard that you help people who are on the verge of committing suicide or something.
      A :   What was that?
      B :   I said that you help people who are on the verge of committing suicide.
      A :   Yes, we do, certainly.
      B :→In what way?
      A :→Well, let me ask this. Are you calling about yourself?
      B :   Yes, uh huh.
      A :   Well, what we do is talk with them. We usually invite them to come into the office, try to determine what the problem is, and see in various ways how we can help by talking   understanding the problem and sometimes making recommendations   sometimes getting them in contact with a psychiatric person to help them.
      B :   I see. Where is the office?

But as compared to ceremonials – where once the slot in which the next piece of talk goes is filled with something else, then the ceremonial doesn't hold the floor, so to speak – I don't think that's so for questions. For example, here's one where, after two questions by someone who had been asked a question, the first question is answered.

A: Hey did you talk Marcia into coming down here?
B: Was she here?
A: Yeah.
B: When did she leave.
A: About a half hour ago.
B: Yeah, I talked her into living here with me.

So an answerer can ask a question after a question. But what happens is, you get a parenthesis in the conversation. There is a question on the floor, and an interlude in which some question or set of questions operates, where, once that is answered the initial question comes back into its relevance as controlling what's supposed to go next.

As I said, as long as one is doing the questions, then in part one has control of the conversation. In our first four instances the person who is calling is doing so, presumably, for help. One difference in them is that in the latter two, the caller starts holding the floor with a series of questions. And by doing that, they have the opportunity to assess whether the proposed help will be something that can help them and whether they're going to use it. They can say, as we get in the third instance, "It sounds too slow." In the first two, that doesn't take place. And what one has in the latter two is a situation where the caller is in the driver's seat; they can hold back asking whether they should come in, and go about deciding that on the basis of the answers they get. Whereas in the first two, the recipient of the call gets the materials, on the basis of which they can propose that the other ought to come in for help.

There is a lot more detail about how, in particular ways, the bringing of an agreement or the holding off of an agreement to come in, takes place. But the outline of it, by reference to this rule that persons asking questions have a right to make the first operation on the answers, is the first thing I wanted to see. You can then watch for it happening in altogether different kinds of scenes.

Let me now focus on the fact that the one who is doing the questions has control of the conversation, *in part*. There can be a sense in which, while you're asking the questions, you could *not* be said to be in control. I'll give one of the best examples I've ever seen of this sort of thing. I took a course called Constitutional Litigation with an enormously smart man, a guy named Telford Taylor who was chief prosecutor at the Nuremberg Trials. The first day, we came into the class and there were twelve people. He went through the list of persons who were supposed to be there. Thirteen had signed up for the course. The door opens and somebody walks in, just as Taylor has finished going through the names. He says "Mr Jones." The guy says "No." Walks

over and sits down. Taylor says, "You're not Mr Jones." "No, I'm not." So he's used the correction-invitation device, asking "If you're not Mr Jones, who are you?" without saying that. In return, he's gotten "No, I'm not." So he says, "Well, on the list here, Mr Jones is the only one who isn't present, who is signed up." The fellow says, "I didn't sign up." Taylor says, "Well I ought to have the names of all the people who are taking the course." The fellow says, "Well I'm not sure I'm going to take the course." Taylor says, "But even anybody who just happens to *be* here!" "Well, maybe I'll leave."

So then Telford Taylor sits and scratches his head, says "I'm sure if I go to the Dean's office I'll find a rule that says if I ask somebody for their name, they have to give me their name." The fellow says, "You haven't *asked* me for my name." At which point the class starts wildly laughing, and Taylor points and says, "Now sometimes you get a witness like that!" And you do, of course, get just this kind of thing; the ability to extend a series of returns which avoid what's being asked for but hasn't been asked for point blank.

Now, in contrast to that, we get something we can call an 'answer constructed by reference to the project of the question.' We've talked about this correction-invitation device. What you got there was, for example, "Is your husband a police officer?" to which you could answer "No" or "No, he's a such-and-such." And it's the latter answer which we can call an answer constructed by reference to the project of the question. That is, what you can see that the question wants to find out, is something that controls how you answer it. Here is another instance of such an answer.

B: I just thought you sent somebody out to talk to somebody. You know, Twelve Step type of thing. Because I must have a—
A: Have you ever been in AA?
B: I don't drink.
A: You don't drink?
B: I mean, I drink if I'm out at a party and everybody's having a drink. I take one to everybody's two, but I've had friends . . .

That is, the caller has mentioned that this clinic might work like Alcoholics Anonymous (Twelve Steps being one of their procedures). Asked if she's ever been in that organization, she gives this answer, "I don't drink." She could have said just "No." But she understood what it was that he wanted to find out, and produced an answer by reference to that.

These sorts of answers take a kind of cooperation which is not present when the answerer leaves the questioner 'in control' of the conversation – which can also be characterized as letting the questioner go off on as many wrong tracks as he pleases, where you can get a long, involved project that generates a series of questions, none of which turn out to have any use.

Lecture 8
On Measuring

I'll begin off with some quotations.[1]

(1)   A: People have to be pretty upset to want to kill themselves.
        B: Oh I have been. Don't think I haven't.
        A: Have you been sleeping?
        B: No I haven't.
        A: And how's your appetite.
        B: Well, not too good.

(2)   A: Let me hear a little more. How's your appetite.
        B: Not too good.
        A: Yeah. Haven't felt like eating?
        B: (   ) other day
        A: And you haven't been sleeping too well?
        B: Not very well.

(3)   A: How are you sleeping?
        B: Well, that's a peculiar part, I sleep very well.
        A: And how is your appetite.
        B: My appetite is very good. That's what I don't understand.
        A: You sound as though you know something about the symptoms of depression.

I want to notice the following sort of thing. Recurrently in these conversations you get a question like "How are you sleeping?" "Not too good," "How's your appetite?" "Not good." Now it looks like absolutely nothing is going on. And quite frankly when I thought I was essentially finished with analyzing this stuff, I hadn't seen something that's going on there that is utterly fantastic. Absolutely unbelievable in a way. And let me just try to begin to show what it is.

I'll start out with something I'd already worked up, which just begins to set this problem. And that is, there are a variety of items on which persons can

[1] Only the first of these extracts is on the tape; the other two are taken from Sacks' research notes.

monitor their own states. They either do it routinely, or, when asked, they have the information which permits them to engage in some consideration and then give an answer as to a current state or current variation from a prior state. The items are things like sleeping, appetite, etc. And all I'm saying, then, is that persons can go about monitoring how they're eating and sleeping. on those questions, they know.

Now for each of these there is a category that Members use, and that category is 'normal.' That is an extraordinarily special category. Each Member employs it. Questions can be asked about it from one to another. But for a large variety of uses of the answer to questions within which 'normal' might be an answer, and for a large variety of the monitorings which might go on by oneself without anybody asking you anything about it, it's quite irrelevant what, for any given person, that notion 'normal' denotes. It's irrelevant whether it's similar to or different from the features that anybody else uses to decide that on some item they're 'normal.' So 'normal' is a standardized category, where whatever it refers to for any given person doesn't have to be specified to control its use.

And there are variant categories which are also standardized, like 'poor' and 'great.' There are whole bunches of terms: Fantastic, cool, terrible, whatever you want. It's essentially the same. We'll call them 'directional differences.' Minus and plus. So we get 'normal,' 'minus' 'plus.'

Variations from 'normal' are noticeable phenomena. They're noticeable by reference to whatever it is that's 'normal for me.' And it's the fact of the variation which is relevant to some state being noticeable, and *not* what the normal state's features are. That is to say, if you sleep four hours a night normally, that doesn't make how much you sleep noticeable. Two hours might be 'poor.' That would make it noticeable. Six hours might be 'poor' for somebody else; that would make it noticeable for them. You don't have to have an equivalence.

It's also to be observed, and equally crucial to the whole business, that the variation categories are standardized, and they're standardized without respect to what they contain or what the normal contains. Any Member can employ the set of categories to formulate their current state; that is, they can say 'normal,' 'poor,' or 'great' without reference to what it is that that stands for, or how what it stands for compares with what anybody else has theirs stand for, and they can talk about it. And if the product of some monitoring comes up with one of the variant states, that provides that that state is noticeable, and provides, then, an occasion for an account of that variant state. That is, it provides for an inquiry being launched as to how come it's that. If there is a collection of variances, then the problem that an inquiry has to solve is their co-occurrence.

Now consider how extraordinarily elegant this is, as compared to a situation which is imaginable if one had to have a standardized content to these things. That is, if one had to have a standard measure such that persons would have to decide whether 'my normal' was 'normal,' and if one had to have measures for the variants, and it was required to know what the 'normal'

was, for any given person to decide that 'my poor' was 'poor.' But such standardization is, not absolutely irrelevant, but essentially irrelevant to the way these measurements are actually done.

There are very special cases, which are set up just by this thing being so extraordinarily simple, where these matters do come into question. That is, there are some physiological states which are dramatically different with respect to what is 'normal,' where that might be taken as something that ought to be found out about. But an enormous amount of diagnostic talk – with professionals, and in conversation which is not with professionals – can go on without much further specification than that; without having to check out what is 'normal,' what is 'poor,' whether that's 'really normal,' whether that's 'really poor,' etc.

It's that set of facts, and the set of items for which those facts hold that provide part of the superstructure that permits these conversations to take place. People don't know each other? They don't need to know each other and nonetheless all this can go on. With respect to these kinds of items we do not have what we ordinarily refer to as 'ambiguity troubles.' Asking, for example, "How's your appetite?" and hearing "Not too good," that's sufficient. What it is that "Not too good" is for that person doesn't have to be known. And, for example, that someone eats an awful lot normally and now what he eats would still be a lot for most people, doesn't matter.

What I'm trying to differentiate here is the following. These are clearly measuring categories of a sort. And one might have the idea that, given the way measuring is done, these are 'rough versions' of something that is mathematicalizable; that persons are talking loosely about something which our business would be, in studying it, to find out what the specific measures are. What I'm saying is, there aren't any such measures built into the use of these categories. I'm pointing to the fact that here's a medical device of a sort. Its power comes from its emptiness in a way. It measures directions, and it can work for normality apparently by reference to 'whatever it is that normal is,' and that's enough. That there is a set of items like this is fantastic. Consider what a time system would look like, or what a monetary system would look like, built on this kind of a device.

What we want to consider carefully, much more carefully than sociologists have ever considered the matter, is what kind of an object do you have for the purposes of counting? Here is another way I came to think about this matter. In about 1956, in the *Journal of World Politics*, Talcott Parsons wrote a review of C. Wright Mills' *The Power Elite*. I'm not a great fan of Parsons, but there he made what I thought was a really basic kind of point. He said, "In this book Mills seems to propose that power is a zero-sum phenomenon." And what that means is, if I have it, you don't. Something adds up to a number that can be divided among the set of persons such that if 90 percent are X, then 10 percent are Y; that is, there can only be 100 percent.

Quite obviously there are lots of things that are not zero-sum phenomena. For example, an economy may not be a zero-sum phenomenon; it can expand. If you put something in you can get more out. And if everybody has a certain

amount, that doesn't mean that that's all there is. And when you're considering social phenomena, one thing you want to do is to try to find out what kind of a counting system you need. Is the object zero-sum or non-zero-sum, or something quite different? And then, how is it that persons go about counting this or that matter?

Let me give a rather simple kind of consideration. Here's a quote from a group therapy session of seventeen, eighteen-year-old kids. The group is made up of four boys and a girl. However, the girl left the group the week before. In this exchange, one of the boys is talking to the therapist, also male.

> *A*:   Did Marian call or anything this morning?
> *B*:   Why, did you expect her to call?
> *A*:   No.   I was just kind of hoping that she might be able to figure out some way of coming to the meetings. She did seem like she wanted to come back.
> *B*:   Do you miss her?
> *A*:   Oh, in some ways   yes   it was nice having the opposite sex in the room, ya know, having a chick in the room.

The first thing to notice here is that MIR categorization device is being used to formulate the absent person, the relevant set 'sex,' the category 'female.' In general, it's to be noticed that the MIR device provides one of the basic ways that Members go about counting all sorts of things. This can be done, since for any category-set there is a known set of categories, and what you do is examine some population – a meeting, a party, one's employees – deciding whether, for this or that category-set, every category is represented. You can have, then, a notion of completeness and a notion of absences. You can then formulate the sort of thing you need to make this or that population complete, where you don't have to know the people you need; you only have to know that they have to be 'females,' for example.

In this particular case, the way this fellow finds of formulating someone's absence is psychodynamically interesting. He is, for various reasons, much afraid of ever showing affection for anybody. And as much as he could do was to provide for the fact that 'some such one' was absent, and that was good enough grounds for him to miss her. But he wasn't going to say that he likes her or anything like that.

More abstractly, such a use of the MIR device is a way one can go about making what I think can reasonably be called 'safe' or 'non-commital' compliments. A category, in this case 'female,' is applied to someone, which discriminates that one from every other person in the place, so that someone is characterized by reference to a category that applies to nobody else. The relevance of that for making a safe compliment may be considered if you think of compliments like "It was nice having someone smart in the room" where, on its use, anybody else can say "Well what about me?" That is to say, there is a whole range of categories which also *can* apply to any other person in the room, and thereby if one is singled out for notice on that item, the

others may be implicitly derogated. Another thing is, just to mention it, that on the category-set used to provide for the way that she's located, it's not simply the case that she's a member of a category that nobody else is a member of, but that everybody else is a member of the same category by reference to the one that's been used to locate her.

Now, there are whole series of ways in which we can talk about Members' counting, measuring, adding up, etc.; that is, we can go about mathematizing social events. Here's an interesting way in which this matter comes up. A woman is talking to her husband; their son had a birthday that day.

> A: I said did Grandma bring you anything for your birthday, I forgot all about it. And Nicki said uh
> B: Yeah I did too this morning.
> A: Forgot all about it.
> B: Oh boy. Well.
> A: I said, Nicki I said Mama has so much on my mind I forgot all about it.

What we can see here is how some set of things can exclude some other thing. The issue wouldn't be that one had 18 things on one's mind and therefore by some logical operation the 19th could not be held in mind. We need to ask what it is that stands as excluding something, when and how any given set of things can provide for the exclusion of another thing, or can substitute for something – all of which are mathematical operations.

Then there is a very nice issue, that of 'erasability.' Some things are in a sense erasable; for example, one can be forgiven. But in another sense it can be seen to remain there, on the sheet as it were, such that if that thing happens again, someone can say "I already forgave you once." Other things don't seem to have even that sense of erasability. Take, for example, suicide attempts. For many diseases, let's imagine that the record of your life is a hospital log with a series of entries. Now let's say there's an entry: "Had pneumonia on such-and-such a date. Cured." That's that. If you get pneumonia ten years from now nobody says "Gee, how come they didn't cure him of pneumonia?" You can get it again and this prior one had nothing to do with it.

So in that sense, pneumonia and many diseases are erasable. The cure removes it from the record. And the next occurrence is not seen as explainable by the earlier one. But suicide is not that way. If you make an attempt at some point in your life, then the fact that, for example, you went through therapy, or you were seven years old and now you've grown up, does not remove it from the record. That thing remains alive. So that if you kill yourself 40 years later, persons will refer back: "See? He made a series of attempts." It's not an erasable matter.

One relevance of suicide not being erasable is the following. Let's say you're now considering whether to go into therapy, as compared to killing yourself, where this would be your first suicide attempt. If you just do it, and do it in

a way that might not look like suicide, your family won't have stigma, can collect insurance, and all the rest. You're in a situation quite different than if you go for help. If the help fails, thereafter you can't kill yourself in the same way. And people know that. And that provides a real trouble about getting people into therapy. Because if they come in under suicidalness, just by going in they have cut off what they see as an opportunity. Because what happens is, if you die in some way which might not look like suicide, the fact that you had that record provides that people ought to look at this death by reference to that record, and they may decide "Suicide."

If you keep suicide attempts off your record, then if you do kill yourself, you may have something important going for you. And that is, the procedures employed for deciding that somebody committed suicide. There are kinds of events which are well recognized to occur. For example, somebody can sit down and drink themselves to death. However, it's a very hard thing to do, and if pills are available, people, it's said, just don't do it that way.

Now if you had a statistical operation for deciding did so-and-so kill himself, you'd take 100 cases and you'd have a notion of the probability of events occurring, so that in 5 percent of the cases where persons died of alcohol they may have killed themselves. You could then bunch those cases and you'd get a distribution at the end, where 95 percent of deaths by alcohol are accidental and 5 percent are suicide. You could pick the five cases that looked closest to being suicide and propose them as probable suicides. It doesn't happen that way. Cases get decided one by one. And each time a case comes up, the fact that there's a 95 percent chance that any death by alcohol is not suicide, is used to decide, "No." And you get the statistical outcome which is that they never occur.

My own feeling about such matters is that a range of decisions are made in terms of 'odd events' versus 'normal events.' And odd events, by and large, are just not added together. So that if one has a notion that some X is a normal event, then the fact that occasionally or two or three times in a row something else happens, that doesn't provide for a shift. One doesn't now say "Well, maybe X isn't the normal event." But, in part perhaps by way of the fact that what is normal gets incorporated into things like proverbs and becomes very stable, odd events are just sloughed off. They don't get incorporated. The fact that it's odd is enough to mean that one doesn't have to consider it on this particular occasion. What you get is, "Those things happen, sure, but . . . "

One thing about odd events, then, is that they're very hard to report. This fact can occasion the relevance of a category that this society has, called 'believing.' So, for example, there are classes of events which are very closely tied to activities that someone ought to do. If the event occurs, the activity ought to be done. Now for some events that are so tied to an activity, those who ought to do that activity may not be in a position to observe the event, but they have to deal with a report. Somebody says the event happened. Fire. Wolf. There's a kind of gap, in the sense that one can't wait to see whether

the thing that stands as a condition for some action has happened, but one has to act on the basis of a report. And of course the Cry Wolf fable is the fable about this problem.

What's to be done when if something happens some action has to be done, and nonetheless the persons who have to do that action can't see to decide? And that's of course where 'believing' fits as a category. 'Believing' can operate on such a basis as the following. A notion of credit is built up about somebody's reporting of events. And his credit is used to decide whether the action ought to be done. It might be that somebody has a specific task, reporting event A, for which some action should be taken. And if they report it wrongly a series of times, they're no longer creditable on event A. It can also be the case that 'believing' does not become event-specific, but that for some person, whenever they say something happened for which some action should be taken, whatever the event and its relevant action, they just don't have any more credit. It may be they have no more credit across whole sets of classes of events, or it may be that while they're not believable in general, for some events you'd figure this is not the kind of thing anybody lies about. And if one was interested in mathematizing social events, one would want to find out what the classes of events are, when they overlap, etc. For example, which kind of event is used to decide that persons are unreliable on another kind of event, and which are not.

Now one of the things about 'believing' is, if you can propose that a person has no credit, then it seems to be quite adequate to use the fact that you didn't believe them, even though the event they reported did occur. In my suicide cases there are situations where a person has killed himself, investigators ask a friend or relative or neighbor, "Did he ever threaten?" They say, "Threatened all the *time* but never *did* it, so we never took him seriously." And that's treated as quite an adequate account by the persons involved, and apparently by those they tell it to.

Well, that's fine, if what is at issue is building an adequate account. But suppose you have the following problem – and it's a live problem. You're setting up a missile receptive system, where dots appear on a radar screen. And the people who monitor the radar screen have to tell somebody to act. Now 'believing' is the resource the society has. But the one who has to act can know that the screens can show dots when there's nothing there, or can show dots and there's something there but it isn't missiles. And if you believe and act upon the reported dots, you're in plenty of trouble. And if there are dots and they are missiles, and you haven't believed the reports, then you're also in plenty of trouble. But that's the category that people seem to be stuck with. And of course in this case an account will obviously not be adequate in the sense that, whether there were no missiles and you acted, or there were missiles and you didn't act, nobody is going to be around to say, "Well, so you did your best."

I've heard talks by persons who are in the business of, I think they call it 'human systems' for things like the Air Force, and as I understand it, this is an actual problem that they don't know quite how to deal with. It seems

they've tried some experiments designed to select persons whose reports would be reliable. And that would be decided by how persons behaved in the experiment. Now that would seem to be fairly reasonable. Except that these guys know it's an experiment, and now they're going about considering what happens if they behave too conservatively, will they ever be chosen? And if they're not conservative enough, will they ever be chosen? And that of course affected the outcomes of the experiments.

Now, for some sorts of organizations there seems to be a system for deciding reliability that has to do, not with behavior but with category membership. One day I was going through some police files on suicide and I came across a series of notes to the police involving the discovery of a body in a college dormitory. A fellow was found hanging in a closet. Here's the sequence of notes.

The first note says, "I am Mrs so-and-so. I am a housemaid in the such-and-such dormitory. At 10:08 in the morning I was cleaning out room 472. I had swept around the room. The closet door was slightly open. I opened it a little more, and there was somebody hanging there. I immediately stopped. I went down and found my supervisor, Mrs so-and-so."

Next note. "I am Mrs so-and-so, supervisor of such-and-such floor in such-and-such dormitory. Mrs so-and-so came to me at such-and-such time and said that there was a body in the closet of room 472. I went to room 472, looked in the closet, and there was a body there. I called the head of the dormitory."

And then a note from the head of the dormitory. "At 10:14 I was called by Mrs so-and-so, the supervisor for such-and-such floor, who said that there was a body in the closet in room 472. I took the elevator up, went into the room, looked in the closet, there was a body there, which I then cut down. I then called the police."

You could figure my God if you want to talk about organizations and hierarchies, isn't that something? That on such a matter that's the way it operates. Well, but maybe it's occasional. Maybe it just happened that time. No so. Recurrently when a body is found in an insitution, you get that sequence. I routinely clip the newspapers, and when you look at things like murders, suicides, etc., you find things like this. There was a recent murder in New York, and the report says, "The body was discovered at 5:24 a.m. by the janitor who woke up the superintendant who then went and checked and then called the police." Some categories in a hierarchical organization do not have enough rights to say that there's a body somewhere without some other category checking to see that there is indeed a body somewhere. Nobody touches the body until somebody who is 'responsible' comes. And they're the ones who bring it into contact with the outside world.

Now, such a sequence is not reserved to those sorts of organizations. And it can sometimes operate in extraordinarily tragic ways. There is, for example, the possibility that if the fellow who hanged himself in the college dormitory was alive when he was first found, he might have been saved. But the first time I ever thought about this matter, the following happened. I was in a

hospital waiting room. They came charging in with this dead eight-month-old baby which they were trying to revive, the young mother, about 18, and her parents. What had happened was, so the mother thought, the baby had suffocated by a pillow over its face. Actually the baby had some disease, but the mother thought it had suffocated. The mother and baby lived about five blocks from the hospital. When she discovered the baby was not breathing – she happened to walk into the bedroom and noticed this – she goes to the phone and calls up her parents who live 45 minutes away, sits down on the front steps, waits until her parents come, and they call the police. And the police then call the ambulance.

These built in sequences! I've been interested in the possibility of orderliness in what people do for a long time, and not known that they could be working in that kind of order. Now, the way I work has been called 'microscopic' with, then, the usual sociology as 'macroscopic.' And it's not a bad distinction. But then it's proposed that social events are not closely enough ordered so that we can get results at the 'microscopic' level of investigation. I take it that we just don't know whether or not that is so. Certainly there has been an argument, and certainly the statistical position has won out. Durkheim posed the matter – which is the basis for the statistical approach to sociology – that if you take the statistical figures on suicides, you find quite an order. And you can study those. And construct theories. Then he says if, however, you deal with such things as the accounts that accompany each suicide, you don't find order at all. They're hastily made up, by low grade officials, etc. But he did not in fact attempt to deal with the accounts. And, in fact, his arguments as to why you shouldn't do non-statistical work were statistical arguments. And it may well be, for example, that the accounts of suicides are closely ordered phenomena.

Another objection to the way I work is that it seems to be enormously laborious, and sociologists are not given to doing things slowly. But one reason I'm operating as I do is, I take it that the big problem is not that we know that social events are not closely ordered, but that we wouldn't know how to describe them to see whether they're closely ordered or not. I want to see if such work can be done in the first place. Then we can repose the issue of where are social events closely ordered and where are they not closely ordered. But it's then an empirical issue that has to be discovered. It couldn't be solved by an argument. And we'll see.

Lecture 9
"I Am Nothing"

B: I'm   a grown woman an attractive woman I have a
                                          ⟋real nice date
A: Do you have any   (at same time as)⟋
B: good looking guy for a date tonight and and I somehow I'm feeling
     that   I'm nothing   (smiling sigh)
A: Uh huh
B: And I know nobody's a nothing   But I am.   It's like everybody
     else is somebody or something and somewhere along the line I muffed
     up

Suicidal persons recurrently say about themselves such things as "I'm
nothing" or "I've got nothing." The question I'm going to address is, can we
describe how they're able, properly, to so speak? Is there some way we can go
about constructing the procedure whereby 'nothing' is a possible product?

We might first ask what would the relevance of such a procedure be for the
persons involved? Maybe for suicidal persons it is said of them, and they know
it is said of them, that they and the project are irrational. If there were
procedures available so that they could report how they arrived at the
conclusion "I am nothing" or "I have nothing," and the person they were
talking to could go through the procedure again and find that their conclusion
was correct, then that might provide that at least this part of their project is
logical and not irrational.

Or, for example, if to arrive at this conclusion one uses materials that are
properly to be considered in producing an activity, and handles them
properly, then another claim that is raised against persons who are suicidal can
be undercut. The claim has been put by Menninger who says about neurotic
or psychotic persons in general and about suicidal persons in particular, that
they lack a loyalty to reality. (Which suggests that 'reality' is, for this society,
a special category. Some scientists and philosophers might say that whatever
is, is 'real,' and the category 'reality' encompasses whatever happens.) A
person might use a procedure which is otherwise properly used to make
assessments, to arrive at the conclusion "I am nothing" as a warrant for
suicide, so as to show that they are committed to what the society holds is
important or sacred, and that it's out of just this commitment that the project

A combination of Fall 1964, tape 7, side 2, tape 8, sides 1 and 2, and Winter
1965, lecture (6) with a brief extract from Winter 1965, lecture (4–5), pp. 1–3.
Transcriber unknown on all these.

66

arises: "I'm not disloyal, I'm forced to conclude that I'm nothing." And persons recurrently do propose that the suicide possibility is becoming very logical: "I tried to reason it out and that's the way it looks."

If we're going to construct these procedures whereby "I am nothing" is arrived at properly and reproducibly (i.e., others could go through the procedure again and find that the conclusion was correct), a first thing we might ask is, what are the objects by which Members in general make assessments of their lives? We'd find that those objects are some subset of the society's recognized values; in particular, those which have a sanctionable way of being counted.

Of those there is a special class of values, which are what I call 'cumulative.' These have two features; (1) If you can properly have them at some stage of your life, then you ought to have them at any time thereafter. (2) You can lose them, so that having them at one stage of your life is no guarantee that you will have them thereafter. And the way they're counted provides that the fact that you had them once is quite irrelevant if you don't have them at the time you're doing the count. The fact that you had them once doesn't count.

That differentiates between things like money and children, and things like 'kicks.' For example, the cumulativity of the value 'having children' is recognized in the proverb 'Children should bury their fathers.' If you had children at some point, you ought still to have them; if they are now dead or if an irrevocable break has occurred, they don't count. Money is counted in the same way. When persons assess their circumstances they don't feel that they may add up how much money they earned over their lifetime, but consider how much they have now. If they do talk about how much they've earned in the past – if they don't have any now – then they'll talk about it by reference to a disparity.

Aside from values like these, for which one can say "I have none," there are other sorts of things which are cumulative, but on which you get a yes–no alternative; for example, being married. For such things, 'no' is apparently equivalent to 'nothing,' and 'yes' at least to 'something.' That is, just because a thing does not have the countable property of money does not make it unassessable in the sense we're examining.

Kicks are different. We can sanctionably say, "Well I had a lot of kicks." The fact that we're having none now, or few, doesn't seem relevant. There may be other things of this sort. For example, if you do something that counts in the society – an invention, a discovery, a contribution – then that can follow you. At any future time, should a person who's done such a thing try to make the conclusion "I'm nothing," it can be countered with "You've done this."

Now, some of the assessable values are so structured that they are only relevant at a certain stage of life. For example, a caller to this emergency psychiatric hospital talks about himself for awhile and then says "I feel I'm a bum. I'm just nothing." And the fellow answers, "No, you're not a bum, you're not old enough to be a bum." That is, that's one thing you're not eligible to be at this stage, so you can't use that to count yourself as 'nothing.'

So there's a notion of a stage in life in which you're entitled to say whether or not you have nothing on this or that value. When persons 25 years old say in assessing themselves that they're unmarried, they're told, "No, you can't say that yet." That's not anything that counts as 'nothing' at this point. These things are standardized; it's a matter of certain formal properties, that your age has to be X before Y counts as 'nothing.' This is without regard to the fact that a child, for example, could be said to be 'unemployed' or 'unmarried.' It may be true, but it's not relevant in this society.

But to get a sense of this 'stage of life' feature as a formal one, we can note that not all that long ago, a quite young child could be relevantly characterized as 'unemployed;' say, before the child labor laws. And, for example, there are old neighborhoods in New York which are partly populated by descendants of Spanish Jews. Among them the proper age to get married is about 15 or 16. Girls who want to graduate high school – not to mention college – find themselves under tremendous pressure from their families, and themselves. That is, the girls themselves talk ambivalently about behaving quite progressively when they're 19 years old and aren't married – or as being failures. And there are Jewish guys in the neighborhood, but not Spanish Jews, who date these girls and find it tremendously troublesome because they are too well received by the families. The fact that you're 17 or 18 makes you perfectly eligible to get married to their daughters, and if you're taking them out, you must be prepared for that.

Related to the stage of life feature is that of 'prospects.' A person who engages in the assessment procedure I'm describing, and arrives at "I am nothing," may then find somebody saying, "Well, that's where you are now but what about your prospects?" Or, as we find consistently for any relevant question, this question could be expectable without ever being asked; that is, it can be independently dealt with by the person doing the assessment. So how do they deal with the matter of 'prospects'? Here's some further talk by the woman I quoted at the start of this conversation.

> *B*: And I do think what man wants a neurotic childless forty year old
>   woman   No man.
> *A*: Well I'm not
> *B*: I know that
> *A*: sure about that
> *B*: I know that   outside of to hit the sack with
> *A*: Uh huh
> *B*: That's not what I want
> *A*: Uh huh

There seems to be a notion of 'entitlement,' whereby one examines some problematic outcome by reference to the Members' theory of how that outcome is arrived at. When I talked about the MIR device, I mentioned that arrangements of its classess provide pathways which persons can use to talk about what they're entitled to expect; given where they are now, where they

could come out. Such a use of that device can involve formulating one's present state in such a way that for the collection of categories one is presently in, one has no legitimate expectations of 'getting there.' One can then propose that one has 'no prospects' on that item.

In this particular case, what is being dealt with could be called a theory of how it is that men go about selecting a mate, and who is eligible to be selected. And there are some very specially interesting things going on in this statement, ". . . what man wants a neurotic, childless, 40-year-old woman? No man." What has to be seen about that formulation, "No man," is that it's to be understood as 'no man Member.' That is, we're always talking about classes and class members. That's important, because you can propose that any actual man who would go about selecting you is not 'a man.' Or, if he is 'a man,' if he claims to be selecting you, that's not what he's up to; that is, he's not up to selecting a wife, but, as she says here, he just wants someone "to hit the sack with." So this business of finding oneself unentitled is not simply a way of assessing some possible future, but a way of dealing with any currently encountered person to find either that they're not eligible, or they're just using a line.

In general, the notion that you can't get there from here has to do with the ways in which persons arrange membership classes to do things; to find pairs, to get appointed to jobs, to become successes, etc. Such arrangements are taken as ways of assessing whether it's possible that you could do that, and as I said, it works not simply to argue that you haven't any prospects, but also as a way of deciding what it is that's happening to you.

Further, if it actually happens that somebody marries you, or you get a job or a promotion, there is a notion of ineligibility that can get used even though it seems that you're eligible by virtue of having been selected. And that's the notion of 'phoney.' "I'm a phoney" focuses on just that sort of thing. The most exquisite statement I've ever seen of that sort was written by a woman in the course of a psychosis which has been named 'depersonalization.' She says, ". . . the feeling itself is one of unworthiness, in the way that a counterfeit bill might feel when being examined by a banker with a good understanding and appreciation of real currency."[1]

We might go about describing this in the following way. For any MIR device category, there's a set of inferences attached to it, which are 'common knowledge.' Some person is a nominal member of a category, but feels that the set of inferences that are properly made about that category are not properly made about them. They can count down along that list of inferences and find "I'm not this, I'm not that," by reference of course to a rule of relevance as to what one is or is not. That is, one is not just saying "I'm not the sheik of Arabia" or something like that, but: "I'm not one of the things that, given my categorial membership, I ought to be." And that again provides for the difficulties such persons have in getting into a relationship

---

[1] In the lecture, Sacks does a rough paraphrase. The exact quote comes from the research notes, and is in *Psychiatry*, 23 (1960).

because they have the notion that what will happen over the course of any relationship they get into will involve the discovery by the other person that each of those inferable facts do not hold with respect to them.

Let me just mention a related category, that of 'imitation.' I'm not using the term with respect to actors in stage performances, but where persons observe some activity and say, "He's imitating." I came across an extraordinarily interesting use of this category in some of the older ethnographies, dealing with the situation of Negroes in the pre- and post-Civil War periods in the South. Again and again I found references to the activities of Negroes as 'imitating whites.' And they were characterized as being 'marvelous imitators.' Such reports are very similar to the way the behavior of children is characterized. And in that sense, then, it's being said of Negroes that they're children.

Now, we want to ask what does 'imitation' consist of, procedurally? How is it that some behavior is seen as 'imitation'? One of the central things that seems to be involved is this: When one normally deals with the activities of a Member, apparently one takes it that they have some right to do some class of activities, and that when one engages in making out what they're doing, one takes it that what one sees them doing is what they are doing. 'Imitation' seems to involve a way of characterizing some action which somebody does when they are unentitled to do that class of action. And if you watch the way the Negro slaves got talked about, or the way the emerging Negro is talked about, you can see how marvelous a category 'imitation' is, because it turns out that everything whites can do Negroes can imitate, but they can't *do* any of these things that whites can do.

So 'imitation' becomes a category which involves the construction of a parallel set of knowledge for those unentitled Members, where it doesn't happen that as they do something one finds that there is 'the doing,' but as they do something one finds that they're able to imitate. One doesn't see that thing which would, by reference to the category 'knowledge and capacity,' be taking place; that is, one sees a child 'behaving like an adult;' following adult rules of etiquette, being able to produce sentences like an adult, "talking like a big girl," etc.

It's noticeable in relation to this, that if the capacities of some persons are treated in this way, then one finds that certain sorts of accounts that can be applied to Members in general cannot be applied to them. So one finds that they can't be found to be 'responsible' for what they do, in a non-trivial sense. If you watch, let's say, the way that children's suicides are described, you'll see that it's not enough to say that the child was depressed, the child got a gun and shot itself or whatever, but there's an added item: How it is that the child was free at that time to do it; for example, their mother went out of the room and then the child took the asprins. That is, part of the causal account is some competent person's actions which permitted this thing to take place.

I take it that 'imitation' is one of the basic categories one wants to focus on when one talks about the phenomenon of ideology. Because it makes noticeable that there are a whole range of things that these persons obviously

can do, which are by and large not seen as things they can do in the sense of things that a Member can do, and the addition of capacities is treated as more things that can be imitated. And that's an extremely interesting kind of blindness, if you want to put it that way. It shows you the power of this procedure because it's apparently a perfectly consistent and reasonable way to talk, and the materials are thus never shifted over to be seen as, "They can do those things." In rather more abstract terms, we can come to see a way in which such categories as 'imitation' and 'phoney' provide us with something very central, in that they serve as boundary categories around the term 'Member.'

Lecture 10
Accountable Actions

I'll start out with several quotations.[1]

(1) A: Hello. This is Mr Smith.
     B: Hello. I was referred to your office by Mr Jones from the
         Conciliation Court, and I felt perhaps someone there would make
         an appointment for somebody there to talk to me. I don't know
         what I want to say to you except I'm confused and the trouble –
         Ask the questions.   I can answer them . . .

(2) A: Hello Mr Brown, this is Mr Smith.
     B: I was told to call down from the Conciliation Court and speak to
         someone. He gave me a card introducing myself to whoever I was
         supposed to speak to, and we had been recommended to Family
         Service I believe it was, and they said they couldn't do anything
         until I had talked to someone at the Emergency Psychiatric Clinic
         for psychiatric examination or something.
     A: Why did they refer you to us?
     B: Because I had tried to commit suicide.

(3) A: Mr Green?
     B: Yes sir,
     A: This is Mr Smith may I help you.
     B: Yes sir, it was suggested by Miss Geno that I call you.
     A: Who?
     B: Geno. With the Epilepsy League.
     A: Oh yes.
     B: We have a problem with my daughter.

(4) B: Hello.
     A: Mrs Gray?
     B: Yes.
     A: This is Mr Smith of the Emergency Psychiatric Clinic.

A combination of several lectures: Fall 1964, tape 6, side 2, pp. 5–17, tape 7, side
1, p. 1, M6, side 1, part 2, and Spring 1965, lecture 3, pp. 3–10 (transcriber
unknown).
   [1] Only the third fragment is actually given on the recording. The others are taken
from Sacks' research notes.

B: Yes.

A: I spoke to your daughter who was quite concerned about you and I wanted to talk with you and see if we could help in some way.

(5) A: Hello Ronald

B: Yeah.

A: My name is Smith.

B: Uh huh–

A: I'm a psychiatric social worker with the Emergency Psychiatric Clinic.

B: Yeah.

A: Your father called us this morning and was very concerned for you.

(6) A: This is Mr Smith and I'm one of the social workers at the Emergency Psychiatric Clinic.

B: Oh yeah. I would like to have an appointment if I can. I'm kind of a depressed personality, and I've been under psychiatric care for–   I had been at one time, and I thought possibly some therapy might kind of help snap me out of it.

(7) A: Hello this is Mr Smith

B: Say, my husband is suicidal and, I mean, he's attempted it about a half a dozen times . . .

I'll begin off by noticing that these phone calls seem to be 'accountable actions.' By that I mean that by and large on the first opportunity to talk after greetings, the person who's called gives an account of how they happened to make the call. We can also notice that they are 'symmetrically accountable.' That is, if somebody calls the agency, the somebody calling gives an account, as in the first three quotations. If the agency calls somebody, the agency gives an account, as in the fourth and fifth.

Now, as I mentioned once it seems to be a fact about invitations that at some point in some relationship, invitations are the proper way that activities get started, whereas a measure of intimacy between the persons is that they don't use invitations.[2] The same seems to hold for accounts of phone calls. Persons who call up someone they are not intimate with, often construct accounts of how that came about. In fact, the way I began to focus on these things in the first place was coming across something I thought was extraordinarily strange, but I guess it isn't. It's a phone call between a man and woman who don't know each other particularly well. At some point he says:

A: Oh I was in the bio med library and I had big intentions of working all day and they flicked the lights and kicked me out. Well that's just–

[2] See lecture 2, pp. 18–19.

I was just gonna call and see if you and your husband would like to
come over.

He constructs the operation of the university as providing for how it is that
he happens to come to make this phone call. There he was, he was going to
study, then he gets kicked out, he's left with nothing to do, and now, by
virtue of that, he comes to make the call. It seemed a little elaborate to me,
but persons do that. And at a little later point in intimacy it seems that they
don't. They just call up and say "Hi, how are you." And if you ask "Why
did you call?" they say "No reason, just felt like calling."

    In the calls to the emergency psychiatric clinic, some of the accounts that
persons offer involve another organization proposing that they make the call:
"I was referred to your office by Mr Jones from the Conciliation Court," "It
was suggested by Miss Geno of the Epilepsy League that I call you," etc., etc.
Some of the accounts have a different character, simply announcing the
trouble: "I'm kind of a depressed personality," or "My husband is suicidal."

    Now, for the purpose of getting a hearing, and perhaps for the purpose of
getting help, there is a sense in which the two sorts of accounts are
substitutable. You can use one or the other, and either of them can work. But
I want to notice that the use of each of these has a different source; that is to
say, different search procedures would have generated the organizational
reference and the announcement of a trouble.

    To call an organization and propose that the call takes place by virtue of the
operation of some other organization, involves informing those you're now
calling that this action is not the first step in the search. That's non-trivial
because persons tend to start a search for help with that place about which
they have the most rights to have an expectation that they'll get help. That's
very unfortunate in a way, because if they don't get it there, they may apply
a formula to that fact: "If not there, where I had most rights to expect help,
then where can I expect help from?" That is, they treat the sequence of calls
as informing them about the likelihood that any next call will be a success.
And they may, then, give up. I have mentioned a few calls in which that's
proposed.[3] In one, for example, a woman says, "I'm a Catholic and you
know, I wonder about Christianity. I just called three Catholic sources. None
of them offered anything." In another, a fellow calls up and says, "I'm very
ashamed to be a Jew," and goes through a report of the difficulties he had
when he called a Jewish agency. He says, "Now there's nothing you can do.
I'm going to kill myself. This treatment I got was the last straw. I only want
it to be known why, and that's the reason I'm calling. You should tell them
they ought to treat people better than they do." And I talk about the way in
which persons take it that when they call an organization the treatment they
get is representative. As this Jewish fellow says, "It's not that they did it to
me, they don't know me, and I don't feel personally affronted. But that they
treat *people* that way!" And at least some organizations have a solution to such

[3] See lecture 6, pp. 43–4.

a problem. They can come off without having refused help by proposing that they are giving help, where the help they are giving you is telling you to call this other agency which is specially capable of doing it.

Let's turn now to the other sort of account; those in which persons propose straight out that they need help. With respect to how that would have come about, a first thing that seems to be worth considering is how asking for help is regulated. In an earlier discussion I drew a distinction between two classes of 'others,' and said something to the effect that one class were persons with respect to whom there was such a bond of obligation that you could directly say to them "I need help," for example, 'family.'[4] We can talk of the two classes as 'insiders' and 'outsiders.' The issues involved here are extraordinarily interesting, but to consider them fully I have to introduce a series of other concepts. I will deliver a long discussion on the matter eventually; for now, I'll just sketch it.[5]

There are strong feelings – and strong maxims which provide those feelings – that you don't turn to "a stranger" for help with personal troubles. And you certainly don't as a first act. There's a proper sequence. And the first place you turn is to your family, or to some insider with respect to yourself. When somebody calls up an agency and says "I need help" – which is the proper thing to say when you're talking to an insider – a signal ought to go up that something is going on here. What can be present is, they've turned to an insider and gotten no help, or for some reason they find that they're not able to turn to an insider. And in this regard, something which might stand as just another way that callers to this agency start off, may be seen as an alternative to "I need help." Things like this:

A: Hello. This is Mr Smith
B: How do you spell your name?
A: S-m-i-t-h
B: I would like to have some information about your Emergency Psychiatric Clinic.

A: Hello. This is Mr Smith
B: How does this Emergency Psychiatric Clinic work out?
A: How does it work out?
B: I mean what do you do.

A: This is Mr Smith. May I help you?
B: Yes, I heard that you help people who are on the verge of committing suicide or something.

[4] See lecture 2, pp. 14–15.
[5] The several lectures in which these matters are discussed are not included in this volume: Fall 1964, tape 10, sides 1 and 2, tape 11, sides 1 and 2, and tape 12, side 1. For a formal version see H. Sacks, 'The search for help: no one to turn to' In E. Schneidman (ed.), *Essays in Self-destruction* (New York: Science House, 1967), 203–23.

A: What was that?
B: I said that you help people who are on the verge of committing suicide.
A: Yes, we do, certainly.
B: In what way?

That is, we get callers starting off with 'requests for information' which involve, then, that over the course of the conversation help will be offered without being 'asked for.' Because asking for help is something that one doesn't do with respect to strangers. So, "I need help" and "How does this organization work?" seem to be alternatives in the sense that persons who use them have perhaps come to do this call by the same paths.

Now, if a person does turn to an insider and does get help, it's notable that the form of help may be that the insider calls the agency for them – thus setting up the sort of thing we see in our fourth and fifth extracts. Or the insider may refer them to the agency. And calls made on that basis will take a very similar format to the calls where the person says "Such-and-such organization told me to call." For example:

A: This is Mr Smith. May I help you?
B: Well, I don't know. My brother suggested that I call you.
A: I see, well he must have had some reason for making the suggestion. Has there been some personal problem or difficulty that you're experiencing?
B: Yes, I just lost my wife and I feel awfully depressed.

And there's another which goes, "A friend of mine told me to call." "Why?" Caller says something, and then the receiver says, "She certainly did the right thing."

I want to stop here and show a way to analyze classes of statements for sorts of things we can find in them. I had these exchanges, where a person calls and says "My brother suggested that I call you" and "A friend of mine told me to call." I thought gee, that's curious. And I tried to think of a paradigm line, of which 'X told me to call' is an instance. It looked like the kind of line about which a psychiatrist would say, "This is a dependent person." And then I tried to see what it was that made it look like a matter of 'dependence.' I thought of the following. A kid comes into a grocery store and says "My mother told me to buy a dozen eggs." It looks exactly alike. It looks very much alike, anyway. And that's one of the major prototypic types of childrens' accounts; naming some adult who told them to do some activity.

Parenthetically, we can note that the fact that such an account by a child is sufficient and they learn that this is sufficient very rapidly, causes rather nice trouble. They can go from one to another among the set of adults who can warrant some activity, to find one that will say "Okay." And I have some stuff in which children were watched over a period of time, and we find that they do systematically go from one to the other without telling the one that

they asked the other, or what response they got, so as to provide that one of them will say "Okay." Then they go back and say, "He said okay." And of course that's known to generate fights in the family, etc.

So we get this prototype, 'an adult said to do it,' and something much like it done by callers to these agencies. And what it does, of course, is to provide that some person other than the caller – or in more general terms, the doer of some action – is the competent individual in the case. Now, apart from the fact that a person is proposing that they're not a competent actor where as adults they might be expected to be competent with respect to some item, the importance of this is the following sort of thing. If one can formulate what a child's set of resources are at some point, then one may be able to examine those behaviors of adults who are said to be 'infantile,' to find just what it is about them that provides that character. By comparing a child's and adult's version of similar statements, one may get an idea of what some of the tasks of socialization are. One can then watch the development of an 'adult' by the shift in the use of such blank forms as 'I'm doing X (action) by virtue of Y (competent agent).' One may begin to see over the course of a child's growth that the child will be using himself as a competent agent for an expanding class of activities. On the other hand, where someone is a presumptive adult, about whom it's said, "They're infantile," we might find that they are producing a statement in which X is something that this person could do on their own, but the Y proposed is some other agent.

Or, for example, by examining childrens' resources we can get a sense of what the psychotherapist is talking about when he says that neurotic adults do not have a good sense of reality and, again, that they remain children. Let me give a conversational excerpt.

> B: How do you make people love you? How do you do it? I wish I knew
>   I wish   I see people doing it all around me and I try to imitate
>   them and I don't know how you do it.
> A: Uh huh
> B: I don't know   It isn't because   You don't do it by loving them
>   you don't do it by   being thoughtful of them   You don't do it
>   by being understanding . . . I I really I don't know how you make
>   people love you I just don't know

One of the things the woman is doing is asking for instructions: "How do you make people love you?" Then she goes through this list: "You don't do it by loving them, you don't do it by being thoughtful of them, you don't do it by being understanding." Now where does she come by that list? They're pretty familiar objects; norms. They're a set of things one is told one ought to do to get what she proposes she didn't get, presumably by using them.

I want to focus on things like this for awhile; they're extremely important: It's rather well known that very young children have, from the perspective of adults, a rather poor notion of causation. They don't know how things happen to happen. Now, among the ways that adults go about formulating

rules for children, are two which it's important to distinguish. Call them Class 1 and Class 2. A prototype of Class 1 is, "Don't stick your hand on the stove." Prototypic of Class 2 is "Honor thy father and mother' – and such things as "If you want people to love you, you should love them, be thoughtful of them, etc." belong in that class.

With respect to an adult's conception of reality we would say that these two are different, in that for Class 1 the consequences, whatever they are, naturally flow from the act done. If you stick your hand in the fire, you get burned. Whereas for Class 2, that's not so. For a lot of things that you do that are said to be wrong or harmful, somebody has to do something to you for you to get the negative consequences. You can 'get away with' things of the Class 2 sort.

Now it's supposed, and it seems reasonable, that there's a stage when children don't know the difference between those two classes. That fact is very important for adults because they exploit it heavily. The way they exploit it is, they'll formulate a whole range of what, as adults, we would talk about as Class 2-type rules, in terms of Class 1 operations. That is to say, they formulate a whole bunch of those rules for which the consequences occur only when somebody does something, as though the consequences occur as a natural fact of life apart from anybody's doing anything. They'll do that even though the consequences obviously involve the adult doing something. So that parents say to children while giving them a spanking, "I don't want to do this, it just had to be done," retaining thereby the relevance of Class 1.

The fact that there are these two separate classes, and that adults do not make a large point of discriminating them, but instead assimilate the one to the other, formulates a very serious set of problems for children. And that is that children are repeatedly faced with the question, "What kind of a rule is that, that I've been told? Class 1 or Class 2?" There's no principled way for them to find out. They have to proceed case by case. And proceeding case by case, they can get into a hell of a lot of trouble. Adults know this and have a whole class of proverbs on it, an instance of which is, "If you tell children not to stick beans in their ears, they stick beans in their ears." Children have to find out what 'sticking beans in their ears' is a case of. Bettelheim, for example, reports kids in Chicago who do things like get into a barrel and roll down a hill onto a main street where there's fantastic amounts of traffic, just checking out whether it's so that you can get hurt. And seriously disturbed children are those who go about assimilating the whole range of Class 1 phenomena to Class 2. They then go about checking out the causal properties of the world as though they were normative properties in the sense that Class 2 rules are.

When children get brought up with a certain amount of assimilation of Class 1 and Class 2 rules, of course they cause tremendous trouble for their parents and other adults. For one, if the child is about to do things like sticking forks in outlets and other such things, then an adult has to be around a lot of the time. And if an adult is around a lot of the time, and is saving the child from these pains, then we get another sense in which the child is learning

that the rules are indistinguishable. Whereas an adult spanking a child might want to retain the relevance of Class 1; here the child is learning that Class 1 rules are Class 2 rules because it depends on whether an adult is around to punish you, that you get hurt or not.

Now a major device for children, for separating these things out, are things like lies and secrets. They begin to discover that there are some things which they can violate, that, if the adult doesn't know, isn't told, doesn't find out about, nothing happens. And that may operate in alternative ways. One way it may operate is that they develop an adequate notion of reality; that is, they separate Class 1 and Class 2 rules. An alternative way that it may operate – and this is one of the ways that a person who is said to be neurotic can be seen to be neurotic – is that one doesn't see rule violations which have had no consequences as involving, therefore, Class 2 rules, but as involving Class 1 rules with no time-bounds on their operation. And one spends one's life awaiting the natural consequences of those actions which were violative of the rules. Persons in such situations live out a great part of their lives under the sense of the impending consequences of their violations of Class 2 rules seen as Class 1 rules. That's a considerable part of the 'neurotic sense of guilt;' an ever-present sense of guilt which consists of their knowledge of the set of Class 2-type violations that they've done, like not loving their parents, etc., for which they haven't – yet – been punished.

What they tend also to do by not putting a time-bound upon the operation of these rules; by not saying if at some time the consequences haven't occurred then they must be Class 2 not Class 1, is to formulate these sets of rules as 'prophecies.' So when their parents had told them "If you don't change your ways no man will ever love you," then you'll find forty or fifty year old people who eventually can give as an account of the failures of their romances that indeed they never changed their ways, and their parents were right. So they live out their lives under these rules as prophecies of what it is that will happen to them.

And persons can be found to hold the notion not only that the fact that it hasn't happened yet doesn't mean that it's not going to happen, but that that only means, for example, that when it does happen it'll be even more ferocious. "Things look great now, but boy, wait till it happens." And positive things are treated, not as contradictions with what your parents told you, but, for example, as the rise which will make the fall even more dramatic. There are whole sets of paradigms in the history of the culture which stand as examples: Sodom, the decline and fall of Rome, etc., where the enormous rise can be treated as an example, not of a rise which inevitably happened to fall, but the rise that was so great to make the fall worse. There's a thing that the therapists who are lucky enough to have such patients – lucky enough because the patients are all rich – call a 'success syndrome.' And that involves, let's say, a man who comes from 'nowhere,' 'the wrong side of the tracks,' and at a fairly early age amasses enormous success – in business most particularly. And at that point when he's been elected executive vice-president or whatever, he goes into a depression and becomes suicidal. And what it's

made out to be is the fear that he's finally arrived at that point where the drop will be appropriate to the kinds of sins he's committed. The sins were such that it wouldn't be sufficient for him to lose some trivial $50-a-week job, but now he's being primed; fattened as it were, for a more appropriate slaughter.

So that just gives, I think, a sense of what it is that the psychotherapist is talking about when he says that neurotic adults do not have a good sense of reality. And also when they say that they remain children, and that the projected operators in their presumptively adult lives are always parents, you can see what it is that the psychotherapist is seeing.

Lecture 11
On Exchanging Glances

An assignment has been given, having to do with observing people exchanging glances. The recording starts after whatever description of the assignment has been made.

Q: Can I ask a question about this assignment.[1]

HS: Yes.

Q: For each person that we notice looking over at somebody are we supposed to ask them if they know the person?

HS: No! Don't ask!

Q: But we have to write down the class and everything, how can we possibly know if we don't ask.

HS: Yeah, class membership doesn't mean Junior, Senior.

Q: Oh I realize that.

HS: I don't mean social class, either. I mean class in the sense that I've been talking about class. Any class. Whatever it might be. You figure it out. When two persons exchange glances, see if you see anything similar between them, and see if you see what it is that might be what they're noticing. If you find that you don't know at all, you can say that. I don't think you're that naive. You walk through the streets and you're constantly classifying the persons you see.

Q: ((re would it matter if the glancers knew each other; e.g., were sitting at the same table and someone walks by and the two at the table exchanged the glance.))

HS: No, I said I wanted persons who are not interacting with each other. Though you can add variations if you please. But the specific assignment is for persons who are not otherwise interacting with each other.

A combination of three sessions. On tape 6, side 2, prior to the lecture proper, an assignment is given and discussed. Then on M4, side 1, part 2 an entire session is given to remarks based on the papers handed in by the students. That is continued on tape 14, side 1.

[1] This lecture differs from the others in that, among other things, it includes many student comments, contributions, and questions. These have been omitted from the other lectures as much as possible, materials generated by them having been assimilated into the text.

I'll give you an example of what I mean, just from a lay approach to the matter. I was walking down the hall the other day, to give an exam to one girl. She was standing, leaning up against the wall. In between us walked another girl. She passed this girl first, and then me. And the girl who was standing leaning against the wall looked at me and gave a shrug of her shoulders with a big smile, which I returned. And I don't think it was a big puzzle over what was going on. The girl who walked by was smoking a pipe.

Now, the two of us knew what we were noticing. But that can be problematic. For example, on the Berkeley campus or in places in Berkeley, you often find interracial couples wandering around, one of whom is Negro, one of whom is white. And people who look like tourists, visitors to the campus, etc. – that is, strangers – will stop to look at these couples, and then check out with others around. The question-form might be seen as something like "Am I in Rome, or am I here?" That is, Rome, generically. "Do I know where I am so that I know that that's something okay or something odd." And when they do that, people will not infrequently just look back at them and give them a negative stare. As if to say, "Who the hell are *you*." And that's treated as very disturbing.

So sometimes when you search out somebody to exchange glances with, it may be about something you took to be deviant. And for something deviant it may be that you look at anybody. Now, for other noticeables, persons may pick out special classes. I want you to try to see what the classes are. I have by no means collected these things systematically, and it's done all the time.

Q: Something occurs to me. I can usually tell when some sort of interaction is occurring, let's say, and someone is looking at me. But if someone is looking at someone else, it's going to be kind of hard to differentiate between people that just happen to be looking at each other, as opposed to ones that there's some reason for an interaction.

HS: Try it and see.

Q: and if you make a mistake, you're liable to come to a lot of false conclusions.

HS: Try it and see. If you feel doubtful, put down that you're doubtful. I spend a lot of time watching people watch people and exchange glances. And it's often no big deal to see that people are exchanging glances. They turn at each other, across a room or from a distance, and exchange big broad smiles sometimes. In some places there's enough turnover so that these exchanges will happen pretty frequently. And it seems to me that people are noticing all the time. I may be all wrong. Maybe you can't tell when people are looking at each other, but you can only tell when people look at you. Maybe you couldn't even tell that. But I would find that odd.

Q: Do we have to watch others watching each other? or can we watch.

HS: No, I want you to be watching others watching each other. You can add personal remembrances if you want to, or you can begin to record the encounters happening to yourself. But as the assignment,

you're to be watching others looking at each other. And I'm willing to make a fair bet that you can guess, seeing somebody get up and start to move out of a place, whether they will be somebody that others will notice. And you can probably say who will notice them, knowing nothing about the persons except what they look like; both the person who gets up and the other persons around. Because after all, when persons look at somebody passing, they know from having scanned the room in the first place, who to turn to to get an exchange of glances.

Q: Is it okay if we write down, if it happened in different places–

HS: Yes. Put down the place and the time. The more detail the better. And if you can type these it would be a help, since I'm perfectly willing that anybody in the class takes the collection of them and sees what they look like, writes a paper on it, whatever else. We'll have the product of a bunch of persons going out independently. Now we'll see if they look alike.

I'm going to start to talk about your first assignment. I don't have all that much to say yet. I find them something to think about, and I want to begin with something that was suggested by some of the papers. Let me make a couple of remarks about the problem of 'feigning ignorance.' I found in these papers that people will occasionally say things like, "I didn't really know what was going on, but I made the inference that he was looking at her because she's an attractive girl." So one claims to not really know. And here's a first thought I have. I can fully well understand how you come to say that. It's part of the way in which what's called your education here gets in the way of your doing what you in fact know how to do. And you begin to call *things* 'concepts' and *acts* 'inferences,' when nothing of the sort is involved. And that nothing of the sort is involved, is perfectly clear in that if it were the case that you didn't know what was going on – if you were the usual made up observer, the man from Mars – then the question of what you would see would be a far more obscure matter than that she was an attractive girl, perhaps. How would you go about seeing in the first place that one was looking at the other, seeing what they were looking at, and locating those features which are perhaps relevant?

Now the matter is important because there are many occasions on which you might *want* to feign ignorance. I want you to come to see that that has to be learned as a special task. Here's the sort of thing I mean. In a short story by Conrad Aiken which I forget the title of, some fellow is engaged to some girl who claims that she's exceedingly innocent. And what bothers him is that her body doesn't seem innocent; that she knows what to do. She knows too well how to behave, it seems to him, to have not done elsewhere what she's doing with him. And the task can be quite delicate. For example, sometimes women can be in a group of persons one of whom is their husband, and their

husband takes it that they're not very knowing. And they play that with him, but can perform in such a way that others will know that that's not so.

Here's a related sort of issue. I once glanced at a paper concerned with teaching actors how to learn to make an error in doing something. For example, if your job is to be some professional, and in the play that professional makes an error, you have to learn how such a one, who knows how to do something, could do that erroneously. And the various set of things that you go about doing erroneously may give away the fact that you know just what you're doing. There could be erroneous ways of doing integration in calculus, one of which would indicate that you have no idea what those symbols are, others of which might indicate that you know how to do integration.

I think of a classical story, a very fantastic event that happened in the last couple of years. There was an automobile accident outside of Moscow. One of the victims was the leading theoretical physicist in the Soviet Union, and one of the very few leading theoretical physicists in the world. He was killed. But they didn't want him to be killed, and so, through some unbelievable exercises they organized a staff from around the whole world to bring him back. And they reassembled him, essentially. He was absolutely destroyed; clinically died five times in the first ten days, and they had a fantastic team of persons coming in to put him together again. Now the question was, was he going to be the same guy? So as he began to recover – and that meant very dramatic kinds of developments from essentially infantilism – his colleagues would go in and talk to him.

One crucial day, one of the colleagues comes out very depressed and says, "He's not himself." And they said "Why?" He says "Well, we were having this discussion about some problems and I asked him a question, and he came back with this answer, and that's just not so, and anybody knows it's not so." And they all sat there bemoaning the fact that it looks like he's finished. Then it suddenly occurred to somebody, "My God, look at that answer!" It was a far more elegant solution to the problem than anybody had thought of. And it was just not available to any of them, but they knew that that's the way he would work. So that situation was transformed very dramatically. And in that regard, let me just note that, for example, things that children say, which they have no right to say, can be treated as 'errors.' That is, errors are socially stratified in many ways.

Let me go at this business of 'inferences' in another way. The problem that I am stuck on at this point, and I don't have anything like a solution to it, is how does a glance become an action? What kind of a world do you have to build to make a glance an action? Let me start off by reading you a quote from an extremely important book, the title of which I also forget. I think it's called *Sight and Sense*, but you can easily find it given that the author's name, Von Senden, is not that common, and he only has one book translated into English. It was written in, I guess, nineteen twenty something. It by and large reports on others' investigations which had never been brought together. The book is exceedingly important in a lot of ways. The very eminent psycholo-

gist, Head, made a great deal of his reputation on his analysis of the materials Von Senden presents, which Head was able to do because he knew German and the book hadn't yet been translated into English. And the theory that he developed is built largely on Von Senden's work. So far as I know, sociologists have not used the book; the place where you would expect to find it among the classical sociologists is Sandeke, but I don't see that he even had any reference to that kind of material.

The book is about persons who, typically, were blind from birth and who got sight, and what kinds of things they could learn to observe afterwards, and what kinds of things they never learned to observe if they got sight too late. On pages 61–62 we get a report by Dufau of "a girl who only discovered at the age of 12 that she differs from other people in lacking a sense, and who now seeks to discover the nature of this unknown sense." And she says:

> I posed myself a host of questions about this new and unknown state which had been described to me, and did my best to come to terms with them. In order to satisfy my doubts I had the idea of trying a strange experiment.
>
> One morning I again put on the dress which I had not worn for some time because I had been growing so rapidly then from month to month, and thus attired I suddenly showed myself at the door of the entry room in which my governess was already working at the window. I stood listening. "Good heavens Lucy," she said, "why have you put on that old dress that only reaches to your knees?" I merely uttered a few idle words and withdrew. This was enough to convince me that, without laying a hand on me, Martha had immediately been able to recognize that I had again put on the dress that was too short. So this was seeing.
>
> I gradually recounted in my memory a multitude of things which must have been daily seen in the same fashion by the people about me, and which could not have been known to them in any other way. I do not in the least understand how this happened, but I was at last persuaded. And this led gradually to a complete transformation of my ideas. I admitted to myself that there was in fact a highly important difference of organization between myself and other people.
>
> Whereas I could make contact with them by touching and hearing, they were bound to me through an unknown sense, which entirely surrounded me, even from a distance, followed me about, penetrated through me, somehow had me in its power from morning to night. What a strange power this was, to which I was subjected against my will, without for my part being able to exercise it over anyone at all. It made me shy and uneasy, to begin with. I felt envious about it. It seemed to raise an impenetrable screen between society and myself. I felt unwillingly compelled to regard myself as an exceptional being that had, as it were, to hide itself in order to live.

Most of Von Senden's work concerns the perception of patterns. If persons are blind from birth and they get their sight as adults, it turns out that certain patterns just can't ever be learned. They may not ever learn how to see a rectangle. They know what a rectangle is, and they can find it by counting the points. But where one sees, quote, at a glance, a rectangle, a triangle, and other such things, they never learned how to do it. Now there are lots of other things that people see, quote, at a glance – and perhaps that blind persons know the categories of. And how it is that persons come to see these things that they do see in this fashion we don't know very much on. But what's important in the first place is to try to determine, in part, what it is that is seen in this fashion.

And that's why it's sort of a pain to intellectualize this stuff such that you already talk about it as though, "I see a blob, and then I infer that it's my mother because she's a blob like that," when what you see is not that. And it's an extraordinary experience when it turns out that you do see somebody in something like that fashion. I just recalled, in Fitzgerald's novel *The Last Tycoon*, he reports a scene where this girl remarks that walking in New York, seeing a man approaching, finding a whole series of properties of him which she doesn't especially like, it turned out it's her father. That is a special sort of experience, but I can understand why you talk that way. You may find that some philosopher has convinced you of this. But 'inference' has another kind of use.

So where are you going to start to try to build a way of dealing with this stuff? We start out with the fact that glances are actions. That's the first fact. There's a beautiful report to this effect. A guy is looking at a girl, looks around to find somebody to exchange glances with, catches the eyes of another girl who looks like this one in some way, and turns away quickly. That is, he sees her sanctioning his looking. And how do we start to provide for glances as actions? I take it we have to start building classes. Earlier I was talking about persons being representatives of classes of which they were members. And the sorts of things you've reported suggest that what persons see is a class member, for whole collections of classes. You see 'a girl,' 'a Negro,' 'a such-and-such.' That is, the class permits you to see what it is that's there. It permits you to see.

To liven this matter up, I'll read you something from *The City of Plains* by Proust. And Proust is an incredible sociologist, as you may know if you've read it – and if not you certainly ought to, even if you're not interested in literature. There is a scene where Proust is watching events take place in a courtyard below. He sees a whole sexual confrontation between two guys, which he describes absolutely fabulously. Then he writes:

> From the beginning of this scene an evolution in my unsealed eyes had occurred in M. Charleaux. As complete, as immediate as if he had been touched by a magician's wand. Until then, because I had not under-stood, I had not seen.

The vice – we use the word for convenience only – the vice of each of us accompanies him through life after the manner of the familiar genius who was invisible to men as long as they were unaware of its presence. Our goodness, our meanness, our name, our social relations do not disclose themselves to the eye. We carry them hidden within us. Even Ulysses did not at once recognize Athena. But the Gods are immediately perceptible to one another, as quickly as like to like. And so, too, had M. de Charlieux been to Chiupien.

Until that moment I had been, in the presence of M. de Charlieux, in the position of an absent-minded man who, standing before a pregnant woman whose distended outline he has failed to remark, persists, while she smilingly reiterates "Yes, I'm just a little tired now," in asking her indiscreetly, "Why? What is the matter with you?" But let someone say to him "She is expecting a child," suddenly he catches sight of her abdomen and ceases to see anything else. It is the explanation that opens our eyes.

So, the classes and their categories permit you to see. That's a start. It's not enough to make a glance an action. As some of you noticed and reported, it's not merely that some observer is seeing by reference to some category, but that the one being observed sees what the observer is, and is seeing. And we get into that whole jumble there: A, seeing that B is looking at A, sees what B is, and what B sees, etc., etc.

That A can see what B is, and what B is seeing, may seem the most trivially obvious fact. But it was the economist Bagnanin's seeing that fact that provided for the modern revolution in economics. Until the book *A Theory of Games in Economic Behavior*, the major theory of economics used the Robinson Crusoe model: A man alone in an environment, and now he has to go about deciding what to do, what things will work, etc. And any other person is to be conceived as a part of the environment. That meant that you could give statistical treatment to the various parts of the environment. Now Bagnanin was, among other things, a great poker player. And he saw that economics could not be constructed along the Robinson Crusoe model, and took poker as a model. And in poker you can't treat the other person as a statistical object, but as somebody who, whatever strategies you might employ to deal with 'that piece of the environment,' does the same about you. And then, furthermore, knows you do use strategy, etc., etc. If you just read the first chapter of the book, you see that laid out. As I say, it provides for a complete reconstruction of the way of doing economic theorizing. It's a very curious bit of history that Parsons, in his *Structure of Social Action*, posed essentially the same facts – and he left economics because of a similar complaint against economics. But the sociologists apparently didn't appreciate what Parsons was posing, and have come to this kind of position through Bagnanin and Morgenstern, and not through sociology itself.

So, A can see what B is, and what B is seeing. How is it that, given there's a whole bunch of classes available, A can see that? I have to introduce a notion

that will help this problem along. Let's talk about there being, for some collection of classes, an 'order of relevancy' with respect to categories. It seems that a set of circumstances can provide that order of relevancy for some membership class. If the circumstance is that A is being looked at by B, that in itself might inform the consideration of what order of relevancy is operating here. And if there is an order of relevancies, we can begin to locate certain facts that obviously do occur. For example, 'failures' can be located that way. And 'absences.' People talk about "missing something," "not seeing something."

Now a third thing may be very extendable, but for now I'll only deal with classes that have two subclasses. For some classes, A, being observed, sees that B, doing the observation, sees that A is a member of some contrast class such that A is one part of a paired class and B is the other. Where for each, there is an order of relevance which provides for the other as being an observable, and – and this is absolutely important and the thing would not work unless it was present – the order of relevance of each was available to the other.

With that, we can begin to handle some rather nice kinds of events; you can begin to see what the following kind of trouble is. A girl looks at a guy. And what he does is, he takes her glance and then looks over his shoulder. And what's going on is that he knows enough to know the sort of thing she's looking at, by reference to the class – she's looking at 'an attractive male' – and he has that sort of insecurity which provides that he's not eligible, so it must be somebody else. This complementarity of orders of relevance permits us to see how persons are operating when they talk of themselves as 'worthless' or as 'nobody.' And it's this complimentarity – that one knows what the other classes do – that begins to tell us what may be going on, in part, where some guy is looking at a girl, now looks around and catches the eye of another girl who is somewhat similar to the first, and turns away. That is, he does not seem to just continue looking around as though, "Well, she's not a male so how would she know what I was doing?" Or, for example, some of you report a person will be walking, sitting studying, just doing nothing, and then see somebody looking somewhere, and, quote, follow the glance, knowing that there would have to be something at the end of the glance which is worth looking at. And if you can see what it is that is doing that looking, you could have a pretty good idea of what it is that would be at the end of it. So this complementarity is equally as crucial as the fact that one is able to see what somebody with whom you are a member of a class in common is seeing when they look at you, or another. The sense of there being 'a society' is that there are many whomsoevers, who are not members of this or that class, who are able to see what it is that one is looking at.

Now there are other things that you talked about, which are worth thinking about. For example, people talked about the fact that persons didn't exchange glances over an average person. Now what you have to attend is the notion of 'average' that you employ. Because I don't think it's the case that you use it in the following way: You're sitting someplace, a set of persons pass you by, and you construct a distribution over that set of persons and provide

that those that stand out from that set, after let's say, watching awhile, are the unaverage ones. Rather, somebody's being outstanding may be quite irrelevant to the collection of persons surrounding them in the scene; that is to say, those who have passed before or who come after.

A while ago I gave some examples of odd suicides, and I said then that given the procedure that's used – that is, case by case – what you have is that an odd suicide gets separated off and is not used to consider the, quote, normal ones.[2] So a stream of odd ones is only something to be remarked upon, like "Isn't it amazing today, there's such a stream of absolutely beautiful women who walked through such-and-such a place." It isn't that one then finds that one is going to modify the notion of 'average' because of that. And that then means that those categories have to be given special attention.

In many of your reports it's proposed that what makes something noticeable is that it's an 'incongruity.' I've given a glancing attention to the phenomenon of incongruity for a long time, but it's only now that I feel that I'm beginning to get a handle on what I might be able to say about it.

A first thing we need is a notion that what Members see is decomposable by them. That Members can decompose some event, situation, complex, whatever you want to call it, is no surprise at all, given the sorts of things we've been considering. That is to say, we've been talking about activities as being 'assembled.' And if that's so, and if Members can see that that's so, then, that they can take them apart would not be especially surprizing. The question then is, having taken something apart, how do they put it back together again so as to find what it is that's strange.

The way they seem to do this involves treating something that they see as a combination of parts, some of which have names. And to those nameable parts are affiliated standardized procedures for producing those objects in some combination. I'll give you an example. You see a man in a car. Now a car is a 'possession,' and there are ways that one properly, normally, legitimately, expectably comes to have it. And apparently what goes on is that when one sees 'an incongruity,' one of the things one sees is that it does not seem that the proper procedure for this possession having come to be possessed, has produced the combination of this person and that car.

A guy I know told me the following story. He looks like a bum, is usually unshaven, wears very tattered clothes, and has a big flashy car. He's driving down the Massachusetts Turnpike and there's a police car sitting in the grass that divides the highway. He passes the police car, drives along below the speed limit, the police car starts to follow him, follows him along for a while, finally pulls him over. The policeman asks him for his license, the guy shows him his license. And now we get the following interchange. "What do you

---

[2] See lecture 8, p. 62.

do?" "I go to school." "Where do you go to school?" "Harvard." "That's very nice. Where are you going?" "I'm going home." "Whose car is it?" "My mother's." Then the policeman says, "Look, would you do us a favor?" "Sure. What do you want." "Would you get a shave? if you don't, every policeman on the Turnpike is going to have to stop you." That is to say, for such a person, how it is that they come to have gotten that car is a problem. And the incongruity is seen in that way; by virtue of the car being a possession, how would it come to have been possessed by such a one?

Or, for example, I talked about a woman who proposed that she was 'nothing,' and said "What man would want me?,", given her set of features. And in analyzing that, I said that what she was proposing was that given her features, the correct procedures for somebody selecting a woman would not arrive at her being in some pair.[3] And we can see a sense in which, whether in any given circumstance the person who says that is correct or not, they are in fact employing a procedure which might be employed if they happened to be together with someone; that is, people would say "How did she come to get him?" That is to say, one thing which seems to be observable as an 'incongruity' involves two persons being present, a man and a woman, where there's some special difference between them: A worn old man and a very young pretty girl, or the reverse. And now they get noticed, an exchange of glances takes place, and the question that seems to be asked is "How did he get her?" or the reverse. What one is doing is employing the procedure by which persons properly come together and finding that that does not produce these two persons as a pair. And one can then produce an explanation; for example, "He bought it" or "she bought it."

So that the procedures whereby persons come to be in some combination, or come to have some object, seem to describe in part what it is that you've observed, and what I had observed earlier but had never really been able to figure out – how it is one sees an incongruity, and also sees the possible illegitimacy of some combination.

Now, in some of the reports what we seem further to find is that where persons are concerned, units of larger-than-a-member are observable. People can see 'a family,' for example. That may be trivially obvious, but it's very important, and it has to be achieved in some way. One of the reports has a powerful instance of the relevance of persons seeing such a thing as a 'family.' One of you reports that you were driving along and a car pulls up and stops. It doesn't seem to stop anywhere special, just pulls up and stops on a street. The door opens and a girl of about 18 charges out, runs across a lawn and stops, and starts shrieking. In the front seat are an older man and woman. The guy jumps out of the car, charges across the lawn, comes up to the girl and gives her a smack right in the face. At which point some of the passing cars slam on their brakes, and some people start getting out of their cars.

The man and the girl stand there, face to face, screaming at each other, and then he just grabs her and drags her back to the car. And people look at each

[3] See lecture 9, pp. 68–9.

other, shrug, and say "*Well*," get back in their cars and go on their way, taking it that it's not after all a kidnapping scene or an attempted murder, but it's 'a man and his daughter' and he's punishing her for something she did, or something to that effect. No attempt at intervention is made. Whereas I take it that were the unit 'family' not available to them, and relevant features of it not observable in the scene, then it could be expected that people would intervene. But given what they saw, intervention becomes 'meddling.' And one wonders, again in part, how much of the failure to give help in dramatic scenes is a product of some order of relationships where the combination of persons and what they're doing is something seeable as 'their business.'

Q1: I read in the paper where a girl was in a car and she had parked a couple of blocks from her home. And another car pulled up and the guy driving asked her for information, "How do you get to the freeway?" She started to tell him, still being seated in the car. The guy said "I can't see you, come around and show me on the map I have with me." And she immediately got frightened, rolled up the windows and stayed in there. And he said "That won't help you," and he tried to get in. And she started honking her horn, hoping that someone would come out, hearing the horn. And so what he did was honk *his* born *back*. And therefore it sounded more like a game, and no one came to her aid.

Q2: The was another situation that was in the paper last week where a woman was sitting in the car waiting for her daughter and her date to come out from a show. And this man got into the car and started beating her up. And she yelled for help, and there was a couple watching, and another man. And no one would help. And afterwards, when the guy left, she said "Why didn't you help me?" And the woman in the couple said "Well we thought you were married and it wasn't any of our business."

Q3: But then on the other hand there was a story in the paper about this young motorcyclist who stopped on the freeway, who looked down below, evidently at another freeway portion where a car had stalled. And he leaned over the railing to ask if this man needed any help, and the answer was a shot from a gun, and he got killed. So these are the kinds of things that may be part of people's fear.

Q4: Which all points to a kind of a pattern of three things: A normal way of going about things, a subversive way of going about things with a normal appearance, and an uncertainty feature operating with regard to all events, since it's known that persons can be acting in a subversive fashion and appear to be acting normally, at the same time it's not known whether in fact they happen to be operating in a subversive fashion. And as a matter of fact it would be more of a problem to account for why that uncertainty factor is not operating, than to account for why it is operating when it is.

HS: Well, that may be. The problem about what you say is, in part, that

in this society there is a considerable shift of the responsibility for locating subversives, from whomsoever to a special group, the police. And persons otherwise feel that they're entitled to suppose that people are what they look like. And if they're not, then that's not their problem very much. It's fairly special that people use a supposition that somebody is not what they seem to be.

Q4:   It's Goffman's argument, the notion that persons feel that if some-body is acting in a particular fashion which they may doubt as being an example of such-and-such, then they're entitled to inspect him for other features that they assign to a such-and-such. I think that's much more common than the other. Because they're engaged in the prob-lem of attempting to make out persons and what they're like, and if they now do something that you didn't figure on, it's obvious that they did something. I mean they *did* it. So it's obvious that

HS: Yeah but the fact that they did it is not sufficient. The first thing that we find is that events are decomposable. And the question is, "Could somebody have done that?" and it could be decided that they couldn't have done it properly, and now we get all these incongruity observations. Now the fact is, Goffman talks about incongruity but he does not tell us what incongruity is. That's what I think I'm beginning to see here in this stuff. *How* it is that one sees it. He has not analyzed how it is that you do 'an incongruity,' what makes it an incongruity. And I think I have the beginning of how it is that you do it.

Now such issues as its import for integration in the social structure, which is what you're talking about when you raise 'uncertainty,' is another matter altogether. Not to say that it's not worth looking at. And the question of uncertainty is in part handleable in the observations you've made in these reports; that is, that people check out the things they've noticed with somebody else. What we have to consider is, what is it that they get out of checking out their noticings with somebody else? Some of you talk about 'reinforcement;' one reinforces their determination that someone was doing something wrong, or that a combination was wrong, by making a check-out with somebody else. And thereby the norms are reinforced. Which is a nice, Durkheimian kind of argument, and it may be true. But there's something that has to be seen about that claim, and that is the mechanism of the procedure in the first place, which is what I'm interested in.

In the first place, if one were engaging in some device for getting reinforcement, it might be supposed that one would want to know the status of the person one uses to get reinforcement from. That is, if you have a question, "Is it the case that this thing I've seen is a violation of the norm?" you might write a letter to Dear Abbey, or ask a priest, or ask your parents, or ask somebody who has special rights. In any case, it might be presumed that you'd be concerned to check with somebody who you knew to have some information about it. But in your reports, apparently what we find is that it's

pretty much an 'anybody' who can be turned to for that check-out; 'anybody' as long as they're a member of an appropriate class, so let's say, a woman turns to a woman, or a man turns to a man. You don't ask for their credentials in the first place, and if they return your glance, give you the smile back that you give to them, or the disapproving glance, that seems to be okay. And that's a fantastic kind of simplicity.

And furthermore, it might be supposed if one was getting a reinforcement, that if the person did not return the same glance, give the same thing back to you, then you would say "Maybe I'm wrong," figure that you're having a wrong response. But no, that doesn't seem to be the case. Given what you've reported in your papers, what seems to be the case are several things. First, if they don't return the same glance, a smile for a smile, etc., you look for somebody else, whereas if they do return the glance, you feel satisfied and look no further. And second, if they don't return the glance, you may make an assessment about *them*: "Who do they think they are?" or "What's up with him?"

So the norms don't seem to be in doubt; that is, the norm that provided for the incongruity that provided for the noticing is not something that seems to be held in doubt. And the notion that it's 'reinforcement' that you get is somewhat obscure. Though the question certainly has to be asked, what is it that people are doing when they exchange these glances? We've already observed that they get exchanged with whomsoever; there's no special credentials involved, except class membership. Another, equally extraordinary part of this – and why, again, 'reinforcement' is a tremendous gloss or oversimplification – is that one takes it that they know what it is that you saw, that they saw the same thing, and they know what you're smiling about, and they make the same assessment. Their smiles tell you that. Now, that that gets done would seem to involve a fantastic kind of social integration. And it can give us a way to talk about 'alienation.' Because one of the senses of alienation would presumably be that you would feel tremendous doubts about doing that. And one would have tremendous doubts about what those smiles and disapproving glances are about; what they're looking at *you* for. Schizophrenics are always reporting that people are looking into them, talking about them, know what they're thinking. And you can see that they haven't constructed a machine which produces events going on in the world, wholly out of their heads. For that thing which they propose is going on by reference to them, while it may not be going on by reference to them, is indeed going on, enormously, and *how* it's going on is an absolute mystery.

The sense of alienation with respect to a schizophrenic would be, in part, that they can't tell when it's being used with respect to them. Or, that they think it works better than it works. Because it's perfectly routinely the case that persons know what others are thinking – without knowing those others – in just the sense that 'thinking' is used as a non-technical term. People seem to know what others are thinking without having any idea who they are, apart from their class membership. Now schizophrenics claim that

others, who don't know them, know what they're thinking. Routinely. Well, there's a sense in which others *do* know what others are thinking, routinely. Again, then, a schizophrenic may be wrong as to when it occurred, but the notion they have is obviously correct; is obviously so.

Q: It seems like that was the basic assumption of the assignment; that we could notice them doing it.

HS: Right. It was the basic assumption, which could have been wrong. But of course it's not like I came into this world the day before I gave that assignment. I know that people can do this, I've watched it many times, and I take it that you've seen it also. However, people who get this far in their education are very prone to intellectualize the whole operation and not see it. And so you don't see that people know what other people are thinking; you figure it's a philosophical impossibility, or you'd have to go through four years of analysis, etc. It was an assumption. And it could have been the case that everybody came back and said "No, I never saw that happen." And that's possible. It might be something that's dying out. A thing that our forefathers had. Like God.

Lecture 12
Sequencing: Utterances, Jokes, and Questions

For the linguists, almost exclusively the largest unit of investigation, the largest unit they seek to describe, is a sentence. So grammar is directed to providing rules for generating sentences, and every time you have a different sentence the grammar is to be reapplied. If we want to study natural activities in their natural sequences, we have to deal with, for example, the obvious fact that a sentence is not necessarily a 'complete utterance.' Thus, linguistics is not sufficient, at least so far as it's by and large done. There is one major exception and it's extremely close to what I'm trying to do. That is Fries' book *The Structure of English* (1952).

We want to construct some unit which will permit us to study actual activities. Can we construct 'the conversation' as such a unit? Can we in the first place make of it 'a unit' – a natural unit and an analytic unit at the same time? The question then becomes, what do we need, to do that?

First we need some rules of sequencing, and then some objects that will be handled by the rules of sequencing. Now, if we restrict our attention at the beginning to two-party conversations, then we can get something extremely simple – though not trivial, I assure you. And that is, that for two-party conversations the basic sequencing format is A-B Reduplicated. It's not trivial in that with three-party conversations it's not the case that the sequencing rules are A-B-C Reduplicated. There's something else; what it is, I don't know. So: A-B Reduplicated. One party talks, then the other party talks, then the first party talks again, etc. I use the term 'two-party' so as to provide for the fact that this does not necessarily mean two persons. The 'two-party' conversation may be a basic format such that conversations having more than two persons present can take a two-party form. That would involve persons dividing themselves up into teams of a sort, and alternating according to team membership, where, then, one team talks – a whole series of persons might talk for that team – then the other team, etc.

Restricting our proper considerations to two-party conversation with the

---

The nine Winter 1965 lectures (all of them owed to 'transcriber unknown') pretty much recapitulate the considerations of 'Fall 1964,' sometimes in a more developed, formal way. Most of them have been incorporated into those earlier lectures: lecture (1) has been absorbed into lecture 1; lectures (4) and (5) into lecture 6, lecture (6) into lecture 9, much of lecture (7) into lecture 3, leaving lectures (2), (3), (8), and (9). lectures (2) and (3) comprise this lecture 12, (8) and (9) comprise lecture 13.

95

sequencing rule A-B Reduplicated, what we have to come up with as a first object is something we can call an *'adequate complete utterance.'* And that will be something that a person can say, which, upon its completion, provides for the relevance of the sequencing rules. That is, on its completion, the other talks, properly. A sentence may be complete, and one could tell that it's complete, but that wouldn't tell you that the person is finished speaking for now. But if they use an 'adequate complete utterance', then, by virtue of the fact that that unit is complete, the sequencing rules are relevant. Again, a sentence is in general not sufficient, though some sentences may be as much as a person is going to say. Nor, for example, is it generically the case that a 'question' is sufficient, though questions may comprise, and frequently do comprise, complete utterances. That is to say, it is not enough to propose that an item was 'a question,' to know that upon its completion the other was to have talked, or did talk.

We want to see if we can get something that stands as an 'adequate complete utterance,' such that upon the use of one or several of these, we have minimally constituted something that will be, recognizably, 'a conversation.' This is not to say that conversations are only built up out of adequate complete utterances, because persons can have ways of detecting that something is or is not complete, apart from the fact that the object is standardized in such a way. Though insofar as they're using other things than adequate complete utterances to make up their talk, they have a special task of detecting that the other is or is not finished, and perhaps what they ought to do now.

Another way that we could tell that 'a conversation' has taken place is if there were some invariable part. We might then go about identifying the fact that a conversation occurred by reference to the fact that the invariable part occurred. Only, as far as I can tell, there aren't any. However, there is something pretty close to that. Take something like "Hello," "Hello." Now, a 'greeting' is an 'adequate complete utterance.' It's standardized as such. When you hear 'a greeting,' then you can take it that when it's complete, it's your chance to talk, if you're the one that's been greeted. There are several things we want to notice about greetings, apart from the fact that they are adequate complete utterances. Greetings are *paired*. And by that I mean simply that if A picks a member of one of those things, then a proper move for B when he has an opportunity to speak – right after it – is to pick a member also; the same, or another. So one party's use of a greeting provides for that minimal exchange, "Hello," "Hello."

Now, it's the case that if A-B Reduplicated is the format of conversations, then there is no specific length that a conversation takes, to be 'a conversation.' And there may be no generic way built into the rules of conversational sequencing, that a conversation comes to a close. So, for example, there can be enormous variance between two conversations as to how much was said. That is, you don't have a situation where some certain amount of talk is required before the conversation can, or ought to, close. Or, for example, there can be an enormous variance as to how much one person has said, as compared to the other. It's not a situation where persons have to monitor how

much they've talked as compared to how much the other has talked, to find that the conversation can, or ought to, close.

Thus – if two things were so which are not so – we could say that we have a 'minimal conversation,' "Hello," "Hello." And we could say that if at least that took place, then a conversation occurred. And we could describe how that could take place, given this A-B Reduplicated format, given an 'adequate complete utterance,' given the 'paired' characteristic, plus a few minor things which I'll point to later on. But the two things are not so. One is, it's not invariably the case that things we would say are 'conversations' contain greetings. The second is, it's not invariably the case that 'greeting items,' such as "Hello," occur as 'greetings.'

Now those facts lead us to require the following: We need to distinguish between a 'greeting item' and a 'greeting place.' Where, then, something is a 'greeting' only if it's a 'greeting item' occurring in a 'greeting place.' If a greeting item occurs elsewhere it's not a greeting, and if some other item occurs in a greeting place it's not a greeting – though some items that are close to greetings might take on the character of a greeting by occurring in a greeting place. We need, then, to be able to say that there's a 'greeting place,' and that any 'conversation' has it. And I take it we can say that there is a greeting place in any conversation, by virtue of the following kind of consideration.

First of all, it does seem that there is no rule of exclusion for greetings. People can know each other 35 years, talk to each other every day, and nonetheless greet each other when they begin a conversation. But take a whole range of other items, for example 'introductions' (telling someone your name, etc.). About introductions it can be said that there are rules for their historical use. At some point in the history of persons' conversations, introductions are no longer relevant. And if they're not relevant, then, when they don't occur, one can't say they're *not* there because there's no reason to suppose that they would be there. Notice that what we're trying to do is find some way of saying, non-trivially, that something is 'absent.' If there were something that was invariably present we would have no trouble. We could say if that thing happens, then 'conversation' occurs. But we need to be able to say that we have a conversation if that thing is present, or if it's absent. And to say that something is 'absent' is a much harder task. The way we can go about doing that is to find that it's always *relevant*. If it's relevant, then if it's not present, we can say non-trivially that it's not there. And greetings have that sort of relevance, in that there is no rule of exclusion for them. So we can say that greetings are relevant for any conversation.

Secondly, we can distinguish between the greeting item in the greeting place, and the greeting item elsewhere. That is, somebody can say "Hello" in the middle of a telephone conversation, where what they're doing is not 'greeting,' but checking out whether the other person is still on the phone, and a variety of other things like that. Thus, the greeting item, to be 'a greeting,' has to occur somewhere in particular, and we can say, then, that there's 'a place.' And in that greetings are relevant for any conversation, that place in

which they are recognizably not something else, but 'greetings,' is present for any conversation, whether there is a greeting item in it or not.

It's not, then, that we just need "Hello," "Hello" or members of that class to have taken place, to have 'a conversation' and to warrant our being able to say that there is a natural analytic unit, 'conversation.' But if we can say about some piece of talk – either a greeting item or a greeting substitute such as "How are you?" – that it occurred in 'the greeting place,' and that piece of talk, whatever it was, provided for the relevance of the sequencing rules, then we could say that we have 'a conversation.' And then we would be able to warrant, at least in part, the fact that there is a unit, 'conversation,' which is natural and analytic, and is generically usable. Of course the description of cases of it may be far more complicated than this, but it has to be noted in the first place that such a warrant has never been made, and that such a unit has not been established. And it's for that reason, at least, that it's of interest.

Now, it does seem to be the case that "Hello," "Hello" is a 'minimal conversation.' Persons take it that it's a minimal conversation. It's not sub-minimal; you don't need more to have had 'a conversation.' And you do need that, or substitutes for it. Children learn this at a rather young age, and you find them producing perfectly recognizable ways of indicating that they have engaged in the beginning of what may be only a minimal conversation, and have not been properly treated. That is to say, one of the ways that one shows that one has done something which is an adequate complete utterance – that is, which is appropriate for the use of the sequencing rules – is to repeat it. So I have these reports where a child says "Hi," there's no answer, and the child says again, "Hi!" And then there's a "Hi" in return, and the child will take that as having been sufficient, and go about his business – which he doesn't do when he says "Hi" and there's no return.

That use of repetition as a way of indicating in the first place that an item was adequate for whatever it is that's supposed to come next, is obviously the simplest way of doing that task. In the child's use of it, however, we get something that's worthy of some brief mention. And that is the way that adults come to see that the child knows something of language. The way adults know that the child is now 'speaking' and not babbling, involves the fact that the minimally recognizable units of infant speech – and this is essentially cross-culturally valid – are combinations of 'p' or 't' or 'd' followed by a vowel like 'a'. And those combinations seem by and large to be used without respect to what the language is; that is, without respect to however the adult language may be constructed. And the way, apparently, that one tells that the child is now speaking is by virtue of the fact that it doesn't simply produce a series of syllables, but it repeats a syllable. In this culture, then, prototypically the first word that a child speaks is the word for 'father,' "da da."[1] The interest of this phenomenon lies in the fact that if you get that

---

[1] Sacks cites the paper in which "this is all discussed," but the title wasn't caught by the transcriber. One possibility is Ruth Hirsh Weir, *Language in the Crib* (The Hague: Mouton, 1962).

kind of stability, across fantastically different languages, then the social sciences and biological sciences come to some close relationship.

So, in the first place, this duplication business is a non-trivial fact, and it's pretty much as simple a way as you can have of indicating a range of things – in this case, that something had been done, and was adequate for the relevance of the sequencing rules. And you can notice the way that parents point out to children their violations on this matter. Suppose somebody comes to the house and says "Hi" to the child and the child doesn't respond. One thing the parents will say is, "Didn't you hear them say 'hi' to you?" Where they take it that they don't have to restate the sequencing rules, but simply point out that the rules have been adequately invoked.

I take it we can say, then, that the unit 'conversation' is warranted by the fact that we have at least a minimal thing that's recognizable as 'a conversation.' For it, the sequencing rules are relevant. We can talk about places in it, or a place in it anyway, and by virtue of this we can also see that – at least for the discipline of sociology if not for any lay interest in it – these things, 'greetings,' are of some central theoretical importance, though "Hello," "Hello" looks like nothing that one would want to attend to very much. Their consideration does an enormous amount of work for us. And once we're dealing with the fact that we've got sequencing here, and it's regulated, we're no longer in a position where linguistic investigations are usable. Because grammars don't differentiate this way.

With "Hello," "Hello" and things like it – members of a class of paired activities such that if A uses one, B's proper move is to use one also – we're examining the sequential building blocks of conversation which are specially relevant in terms of their sequential character. Now, in that light, we can consider jokes. The following comes from a group therapy session; the members are teenagers.[2]

A: Hey wait I've got   I've got a joke.   What's black and white and hides in caves?
B: Alright I give up. What's black and white and hides in caves?
C: A newspaper
A: No.   Pregnant nuns.

     silence

B: Whyn't you run across the street and get me some more coffee?
A: Why don't you drop dead?
D: Whyn't you just run across–?
A: What's black and white thump   black and white thump   black and white thump?   nun rolling down stairs.
D: You know what a cute one is. You want to hear what a cute one is? What's purple and goes bam bam bam bam A four-door plum.

[2] The fragment is taken from Sacks' research notes and is slightly different from, and closer to the actual data than, the one in the transcribed lecture.

A: Terrific
D: I think it's much better than about a black and white nun going downstairs
A: No. that's the new fad. Instead of having elephant jokes, now it's nun jokes.
B: Nothing. A nun.
D: hmmmmm
A: hehhhhh
C: What's black white and grey? Sister Mary elephant.
A: hehhhhh
B: Say whata nuns really do?   they must have some function?
C: ⌐ Nothing
A: └ They travel in pairs.
B: Nothing nothing hehhh
A: They travel in pairs. One nun makes sure the other nun don't get none.
B: You know what's a ball. Whistle at 'em whistle at 'em when they walk down the street.
D: You know   they usually ah pray.
A: Yeah.
D: That's about all.
B: But the rest of the church does. Or they pray harder.
A: They're women who have devoted their lives–
D: They marry God.
A: –to God
A: No. they're women who have devoted their lives–
B: They're women who've had a bad love life and become nuns.
A: –their lives their lives to uhm the devotion of the church.
B: J.C. and the boys.
D: We're on an awfully bad God kick.
A: OK let's change the subject.

The first thing that's important about jokes is that to use one is something like buying a drink among a bunch of people: They come in rounds. And if some person tells a joke then every other person present has the right to tell a joke. So we can say about a joke when it's used, that it's a 'first joke' and that it will provide the occasion for each other person present to have a chance to talk, and to have a particular kind of chance to talk; that is, a chance to tell a joke.

So what? So there are a variety of cases where you get more then two persons present, where exactly what the rights to talk are of the various persons present, may be quite obscure. For example, there may be large status differences or a variety of things like that, and how one goes about providing that each person can talk under such circumstances may be, then, a real question. For someone to use a joke on that occasion is then to give each other a set place to talk, and also to give him something to say.

And in this group therapy setting, those facts are quite non-trivial. The persons are there for two hours, and that they keep talking is absolutely crucial, for the occasions of silence are extremely dangerous to all persons concerned. What happens when they're silent is that various persons in the place now begin to look for a face that's noticeable among themselves, and then pose for that person the problem of giving an account of why *he* is silent. Or, for example, if any given person is silent for any length of time, then their silence is a noticeable fact; something about which they can be questioned. Now, if they want to raise their personal problems they're quite free to do so, but if they don't want to, and given that silence is something noticeable, then it's important to have some sorts of things that will permit everybody to talk, where they can talk without saying anything that can be 'used against them.' It also seems to be the case that any given body of talk, starting at any given place, will, if allowed to go on, end up dangerous. That is, it will end up on some topic which is perhaps too important to be talked about except under real feelings of relaxation. Things like God, death, sex, for example, which always come out, whatever topic is started. And persens are – and the people in this therapy group are – much given to watching when it is that a topic looks like it's about to shift into something that from the group's point of view is to be avoided – though any given person can talk about it 'themselves.'

What seems involved, then, is the development of things which permit talk to go on, and to go on in an 'unaffiliated' manner. Notice about jokes, that when jokes are told they're things that are 'going around;' they're quotes. So they're unaffiliated remarks, and in that sense it's hard to say about somebody that the fact that they told some particular joke has some special significance. They just heard it, and now they're repeating it.

Persons can then monitor the conversation, watching either for silence or for the approach of something dangerous, and start a bloc of talk by flicking in a joke, thereby giving each other person their chance to talk, and to talk 'safely.'

I'll just note here that there are other things which have the 'unaffiliated' character of jokes – that is, the speaker does not disclose his position by using it – but which don't have that sequential character of going in rounds, which seem to get used in similar circumstances. At least these kids use them, and until I noticed that they were being used in similar circumstance to the jokes, I found them puzzling. What they do is, at points in the conversation when either nobody is talking or they haven't talked for a while, insert slogans. They'll just come out with a piece of an advertisement from the radio, or a jingle, or obvious quotations sarcastically said. Again, then, it seems that they go about monitoring when they ought to be talking or when silence seems to be present, and flick out these things which, again, have this unaffiliated character.

Let me turn now to another sort of sequencing issue. I said about "Hello," "Hello" that it's a paired phenomenon, and that when the second one comes out, it may well be that the conversation is complete. And we can note that either one, or both, can be delivered in such a way as to provide for the size

of the conversation. For example, by not slowing down at all as you pass somebody. You say "Hello," the other says "Hello," and there's no indication by either party that there's going to be any more to it than that.

Now, some of the ways that conversations can begin, provide at least a slightly different set of sequential characteristics, although there are ways in which they're related to paired beginnings. Perhaps the best way to introduce it is by just reporting what I did the last time I was trying to introduce this some material, so as to indicate right off that it wasn't as trivial as it looks. Before I presented the phenomenon, I'd asked people in the class to write down the first lines of what they took to be 'pickups.' I got 60 first lines, of which just under 60 were questions.

What I had wanted to be saying to them, and which they could see once they had those collections, was that a person who asks a question has a right to talk again after the question has been answered. So, with a question beginning, the conversation goes at least something like A-B-A. It can go on from there, or it can end like that. And that may be without regard to what the question consists of or what the answer consists of. Now, one way that the conversation can go on from there is that the person who asks the question can use his initial right to talk again, to ask another question, and the same right holds. So you can get indefinitely long chains, running, Q-A, Q-A, Q-A, etc. Eventually I'll go over the special relevance for certain conversations of the 'chain' possibility. It turns out to be extremely important. Whenever it happens to occur in a conversation – and it doesn't necessarily have to occur in the beginning, but that point where somebody starts questioning – then the 'chaining' possibility can be quite crucial to the way that the conversation goes.[2]

Now, of the sorts of questions that occur in first conversations, let's begin by looking at those which have a close relationship to "Hello," "Hello." Note that the use of "Hello" is a regulated matter. It is the sort of thing which can be used to begin a conversation where two persons have some initial right to talk to each other, such that the fact that they happen to be physically co-present provides the occasion for the conversation. But, especially for things like pickups, the fact that the two persons are physically co-present is not sufficient grounds for them to begin talking, and "Hello" may be inappropriate. You can get conversations which go:

A: Hello

[2] This, and the following materials, constitute a next run at some of the phenomena considered in lecture 7 of this Fall 1964-Spring 1965 series. These materials were not incorporated into that earlier lecture although such incorporation has been done with most of the Winter 1965 materials, because in this case it would introduce an anachronism. Specifically, in this second run we see the first reference to "the 'chaining' possibility," which later crystallized as 'the chaining rule' (see Spring 1966, lecture 2, p. 256 and lecture 2 (R), p. 264). Not incorporating these materials into the earlier lecture makes for some repetition, but the genesis of 'the chaining rule' seemed worth preserving.

B: (No answer)
A: Don't you remember me?

Where that involves proposing that there had been an initial right to use "Hello."

In the absence of some obvious warrant for the conversation to take place by virtue of two persons being copresent and nothing else, you get that sort of question which provides that although it doesn't seem to be the case, there is indeed a warrant. There's a whole range of things which tend to formulate a first conversation as a version of an nth. Things like "Don't I know you from somewhere?" "Didn't I see you at such-and-such a place?" "Didn't you go to such-and-such a school?" "Aren't you so-and-so?", etc. All of these provide for the fact that it may be the case that we know each other, and if we do, then this conversation can take place as 'a further conversation.' In those cases, then, and more generally, we have a class of questions which provide an account for a conversation developing; that is, that this is not an initial conversation.

There are a variety of other accounts which focus on different matters. For example, very frequently the first question will be a request. And the request will be such a thing as can be asked when any two persons are physically available to each other; you're standing in a crowd waiting for a plane to arrive and someone asks, "When is the plane expected?" A variety of such informational matters can be offered. Note that for any one of these, to whatever the first answer is, another question can be constructed:

A: When does the plane arrive?
B: 7:15.
A: Are you going to San Francisco also?

It's also to be noted that such standardized questions as "When does the plane arrive?" "What time is it?" etc., by virtue of the fact that they are standardized, provide for the relevance of the sequencing rules such that one knows when one of those questions is complete. Further, one knows what an answer to such a question looks like, so that the one who asked the question can know when the thing that stands as an answer will have finished, and thus provide that the other can talk again. This stands in contrast to discursive talk, where it may not be clear in that fashion when it is that somebody has finished. For persons who don't know the discourse patterns of somebody they're dealing with, the use of standardized objects to build the beginning of a conversation may be quite important. First of all, that you don't wait too long after the other has stopped, where waiting too long might provide for their withdrawal altogether. Secondly, that you don't interrupt, where of course one doesn't want to be 'rude' to someone with whom one is making an effort to get acquainted.

((Thereafter is a discussion of the question "Do you have a light?" See lecture 7, pp. 50–1.))

Lecture 13
On Proverbs

I'm going to talk about proverbs, trying to develop what's interesting about them. I'll begin by doing something I don't normally do, which is to read you the way that proverbs are largely used by social scientists – because it's quite relevant to the task they seem to have set themselves. The first quotation comes from page 3 of a book called *The Study of Thinking* by Jerome Bruner and some associates of his.

> That there is confusion remaining in the adult world about what constitutes an identity class is testified to by such diverse proverbs as 'plus ça change, plus la même chose' and the Hericlitan dictum that we never enter the same river twice.

A very similar sort of remark comes from pages 1–2 (these always come in the first several pages of a book) of George Homans' *Social Behavior: its elementary forms*.

> My subject is a familiar chaos. Nothing is more familiar to men than their ordinary, everyday social behavior; and should a sociologist make any generalization about it, he runs the risk that his readers will find him wrong at the first word and cut him off without a hearing. They have been at home with the evidence since childhood and have every right to an opinion. A physicist runs no such risk that the particles, whose social behavior in the atom he describes, will talk back.
>
> The sociologist's only justification is that the subject, however familiar, remains an intellectual chaos. Every man has thought about it, and mankind through the centuries has embodied the more satisfactory of the generalizations in proverbs and maxims about social behavior, what it is and what it ought to be . . . What makes the subject of everyday social behavior a chaos is that each of these maxims and proverbs, while telling an important part of the truth, never tells it all, and nobody tries to put them together . . . every man makes his own generalizations about his own social experience, but uses them *ad hoc* within the range of situations to which each applies, dropping them as soon as their immediate relevance is at an end, and never asking how they are related to one another. Every one has, of course, every excuse

---

A combination of Winter 1965, lecture (8), and lecture (9), pp. 1 and 8–12 (transcriber unknown on these two) and Fall 1964, tape 13, side 1.

for this shortcoming, if it be one. Social experience is apt to come at us too fast to leave us time to grasp it as a whole.

I don't intend to make any detailed comments about those remarks, except to note parenthetically that Homans' procedure for starting a book is one of the most recurrent you'll find, and in a way it's enough to tell you about the kind of book you have here. He has to have an excuse to study the phenomenon he wants to study. That it happens is not a sufficient excuse. He has to show some problem. And he starts off with the supposition that persons think they know about the thing he wants to study, so he finds a way to show that they don't. Now, to notice that is to notice that in the ordinary world, in everyday life, 'engaging in inquiries' is an accountable thing. Where, then, the work of sociologists remains constrained by that format.

I want to focus on this sort of thing, available in both these quotes: It's a very usual use of proverbs among academics, to refer to them as 'propositions' and to suppose then that it goes without saying that the corpus of proverbs is subjectable to the same kind of treatment as, for example, is scientific knowledge. They then build the basis for an inquiry – which has nothing to do with proverbs – by virtue of the fact that these propositions, when compared – without showing that they are actually compared in their use – are inconsistent.

So one question is, are the collections of proverbs indeed a set of propositions in the sense that Homans proposes? Do you find any reason to suppose that that's so? For example, here's something from a newspaper:

> Premier Krushchev's removal was viewed in Paris today as a serious blow to the improvement of relations between the Soviet Union and the Western powers. The primary reaction of government officials and diplomats was surprise. But they were also deeply concerned. "Better the devil you know," one diplomat said, "than the one you do not know."

Would somebody seriously say to this fellow, "What's the evidence for that?" If it were a proposition in the first place, then the statement "How do you know?" which is used not only among scientists but is offered by Members, might occur.

But one of the facts about proverbs is that they are 'correct about something.' That fact is especially important since some of them contain rules, and are invoked to govern various situations. Now, for many other kinds of rules, even in highly rule-controlled situations like the legal courts, if you invoke a rule by reference to precedent, the occasion of using it can provide the occasion for reconsidering that rule to see whether, not only in this instance but in general, it ought to obtain for anything. So that a rule introduced to govern a situation in a law case can be changed altogether. Which is to say, even a strict precedence system such as that, doesn't have objects as powerful and as limitedly attackable as proverbs.

It's in part that this is so that makes it quite irrelevant when a proverb was established – and in that sense, Bruner's citing of "the Hericlitan dictum that we never enter the same river twice," which is several thousand years old, is a correct use of proverbs – whereas it might be relevant in, say, a lawsuit, when a rule was established and what the circumstances were that generated it. So, for example, in current civil rights cases you occasionally find an extremely old statute introduced, where, then, the fact that it was introduced many years ago by reference to, say, the buying and selling of slaves, can be used to argue that it really isn't worth anything now. For proverbs, such considerations are just quite irrelevant. Likewise, the organization or the society within which they were established is often almost as irrelevant. Where an American court would never think of using a Russian precedent, those Russian proverbs we come to know are treated as quite appropriate in ordinary discourse. For one, then, the object 'proverb' is enormously widely found, and, further, many proverbs are applicable quite across cultural boundaries.

Now, aside from the social scientists' orientation to proverbs, anything I've ever looked at on that matter involves a list of proverbs and where they come from, their age, variations, etc. Nobody seems to deal with actual occasions of their use. And that's because it is the folklorists, with their particular interest in proverbs, who have been collecting them. I want at least to make a start on considering proverbs in terms of occasions of actual use.

There is a class of proverbs known as 'proverbial phrases,' one set of which I'll focus on; things like "You're stacking the deck," "He's hitting below the belt," "You're way out in left field," etc. This set of proverbs comes from domains which have clear parameters. In baseball there are demarcated areas, so that "left field" is a locatable place within that domain. And "stacking the deck" is a locatable violation in playing cards. It seems to me that, for one, this sort of proverb may provide a clarification of the sense in which we might talk about 'families of actions.' And by 'families' I mean this kind of thing: Wittgenstein talks about 'families of games' and proposes, for example, that there is some intersection of rules between games in a same 'family.' I once tried to see what such an intersection of rules might involve, with the following kind of trick. We took violations of rules in one game, which were not violations in another game, and began to use them just to see what might happen. So, for example, if you're playing cards, it's not proper to stand behind your opponent and look over his shoulder, but there's no rule about it in chess. It's nothing. So we did it in chess, and it did cause some kind of disturbances. There was a sense that somehow something must be wrong. And that perhaps had to do with the fact that it was a violation of a rule in *some* game. It seems, then, that there may be a sense in which rules in games can carry over into situations for which they haven't been specified as rules.

And for 'families of actions' we might talk about the following sort of situation. For some kind of activity there may be an event which is, in that activity, not regulated. It's not even seen as an event; there's no language for it, or if it's pointed out descriptively, nothing much would be said about it.

But if you invoke a rule from another activity – especially those which can be produced in proverbial form – then you find that you can come to see the event as indeed an 'event,' and as possibly illegitimate. So, for example, suppose we have a meeting, and there are various interests present at the meeting. The way in which persons arrange their seating may not be treated as something noticeable, and if pointed out would only be treated as, "So they happen to be sitting in some order, so what?" But with respect to playing cards, the way in which a deck is shuffled is something that's regulated. And there are clear ways of violating that, which are observable, and which are talked of as "stacking the deck." And when we propose at a meeting that "the Commies are stacking the deck," then it's clear what it is that's going on, and it's treated as something suspect.

So apparently one uses proverbs of this character to make events noticeable, perhaps to make their ordered character noticeable, and then to formulate their ordered character by reference to their possible illegitimacy – where there is in the first instance no rule governing this or that particular event. We might loosely talk of this as a matter of 'analogy,' though it only becomes analogy once it's proposed that some order is relevant in both circumstances.

What we can come to see is that there can be a very limited set of paradigms or models, each of which may have demarcated areas of order which can operate generatively for an enormous range of further areas – without, however, it being necessary to produce a further set of rules at all, or to further demarcate the parameters of this other mass of events. Once one knows that "stacking the deck" is something that can be done with a set of cards, it can be seen that 'something like it' is being done with a set of people. Or, for example, where "hitting below the belt" is something that is done in an exchange of blows, it can be seen as comparable to something that can happen in an exchange of remarks, and thus to operate in conversation and other sorts of exchange activities. One doesn't have to construct a new language, but can retain the base source of this or that rule, as providing the terms.

I want to turn now to a consideration of proverbs as pieces of the language. In Archer Taylor's classical book *The Proverb*, he mentions in passing one aspect of these things, which got me started on the line I'll be discussing. Right at the beginning of the book he's talking about defining proverbs:

> The definition of a proverb is too difficult to repay the undertaking; and should we fortunately combine in a single definition all the essential elements and give each the proper emphasis, we should not even then have a touchstone. An incommunicable quality tells us this sentence is proverbial and that one is not. Hence no definition will enable us to identify positively a sentence as proverbial.

When I read the book a couple of years ago, what was important in that statement just never occurred to me. I'll formulate it in what may sound a very queer way: If we take it with the linguists and the grammarians that the

sentence is constructed according to some rules, and that it is a kind of unit, then one question we might be led to ask is, what other ways, aside from linguistically, can we talk of a sentence as 'a unit'? What can be done with it? That is, what are the sorts of activities that persons can hope to accomplish within a single sentence?

Such a question is obviously relevant to the analysis of social activities. Leaving proverbs aside for the moment, we could say that there would be at least a special kind of tension in a world where single sentences could do exceptional work. For instance, in the phone calls I collected at an emergency psychiatric hospital, you'd occasionally get the following. A man might report that he's suicidal and offer as the immediate warrant that after 25 years of marriage his wife said, "Well, the fact is I never really loved you." A statement like that has a dual consequentialness. It not only can bring something to a close, but it can provide that some series of events have been falsely seen; that is, it can erase them.

And there is a whole set of things like that. Some religions are carried on that feature. The fact that you can know that at any last moment – if you get a last moment – you can always change your ways sufficiently to erase whatever it is you've done in the past, means that you do not have to order yours sins day by day. That is, no matter how your sins have added up, it's possible at any last moment to change, and to get what anybody can get no matter what they've done earlier. Of course the fact that you may not get that last moment, itself sets up a variety of other kinds of considerations. But the sort of religious existentialism which focusses on every moment as a possible last moment, is itself only relevant given the notion of what can be done in any given moment.

So the issue of what can be packed into some single unit is obviously interesting. And with respect to language, we can examine the variety of ways that the resources of a language have been explored in terms of how much can be packed into something while retaining such central features as, for example, transmissibility and reproducibility. Now, poetry and proverbs have taken a quite different tack from other explorations. It is said that poetry is very similar to mathematics, in the sense that you pack in knowledge with far more economy than prose would offer. And that is shown in elementary mathematics books when they ask you to "rewrite in English the following equation." The same kind of test can be done for a poem. And it may be recalled that early Greek science, for example, did use poetical forms to write up the results.

Now, one of the crucial things about proverbs is that they're objects from an oral body of knowledge. They do indeed get written down, but their basic power and relevance seem to be as oral objects. There is a literature on oral traditions and how they're preserved and used, and I'd like to suggest a most extraordinary book on this subject which is misleadingly titled if you're looking for material on oral traditions, and that's *Preface to Plato* by Eric Havelock. It is about Plato, but you could have no interest at all in Plato and learn an awful lot from it. Its basic concern is, what is Plato up to in his attack

on Homer? Havelock argues that for the Greeks, Homer was an encyclopedia. His poems stored the enormous amount of relevant knowledge that the Greeks had to use, where the Greeks in this period did not, except in very exceptional circumstances, use writing. Homer's poems were one of a variety of very powerful devices used to store that information. Plato's concern was to break down that way of preserving knowledge because of a variety of things that bothered him about it. It's not that Plato didn't like poetry, in the modern sense of poetry, but that he was aware of the ways in which poetry is powerful – and the limits of that kind of power.

I couldn't begin to give an elaborate discussion on the relation of poetry and proverbs, but I can say a few things. Proverbs, like poetry, have a large use of metaphor, and they often have a kind of alliteration, rhyming, etc. There are more or less standard forms which are used, to which any given instance is fitted as far as I know; proverbs are formed as single sentences or phrases of sentences, they're not longer than that. And, like poetry, their reproduction consists of the exact repetition of them – a poem and a proverb lose their character when they're paraphrased. These sorts of features have some real advantages for maintaining a body of knowledge; we can say that they are constructed in mnemonically efficacious ways. That is to say, they're very easily remembered and are thereby transmissible as 'that very item' and not in a paraphrase. Their stability, then, can be something independent from any occasion of use.

Now for proverbs, I take it that one of the core features of their sense and of their use is that they are 'atopical' phenomena. So, for example, the sense and relevance of 'a rolling stone gathers no moss' is not found by reference to geological or botanical considerations. Some of the work of the neuropsychologist Kurt Goldstein and his associates may be relevant here. One of the things they've found for children, brain-damaged persons, and sometimes among schizophrenics is that a kind of test devised by psychologists indicates that these people cannot handle proverbs – they don't understand them, they don't know how to use them. There are many protocols of persons presented with a proverb and asked to interpret it, and they produce long discussions about various features and behaviors of, for example, stones and moss.

Goldstein proposes on the basis of those tests and other indicators, that there's a big split between what he calls 'abstract' and what he calls 'concrete' thinking, and that persons who can't use proverbs are persons involved in a failure of abstract thinking. But I take it that if you look at the protocols, the persons involved seem to be quite capable of dealing with proverbs 'abstractly.' First of all, the proverbs themselves are quite abstract. 'A rolling stone gathers no moss' doesn't contain any reference to a particular rolling stone, a particular kind of moss, etc., etc. And these people who are not able to deal with proverbs properly are nevertheless talking abstractly. They'll talk about "a stone" and how it might roll, and say this or that about moss, without any insistence that it has to be some particular stone.

That seems to me to stand in contrast to 'concrete' thinking. So, let's say, when you talk about some kinds of schizophrenics being "enmeshed in the

concrete,'' you might be pointing to certain kinds of strange things they can do that nobody else can do. For example, one day I was sitting having lunch with a friend of mine and she said, "What day is it today?" I told her what day it was, and she said "Last year on this day I had the following for lunch . . . two years ago this day I had the following for lunch . . . " and she went through ten years, just spieling out the details of her menus. That, I take it, is a pretty clear example of concrete thinking. But the troubles in dealing with proverbs were not of that sort. Again, if the proverb contained the item 'cat,' then people would talk about cats and use the plural term 'cats.' They did not start talking about 'my cat.'

This suggests that we may not be dealing with inability to do 'abstract' thinking, but an inability to do 'atopical' thinking. Where, then, proverbs can be seen to constitute a very clear example of whole collections of pieces of knowledge that are organized atopically. And I take it that it may be this feature that I'm calling 'atopical organization,' that Homans proposes as a possible 'shortcoming,' in the remarks I quoted earlier:

> What makes the subject of everyday social behavior a chaos is that each of these maxims and proverbs, while telling an important part of the truth, never tells it all, and nobody tries to put them together . . . but uses them *ad hoc* within the range of situations to which each applies, dropping them as soon as their immediate relevance is at an end, and never asking how they are related to one another.

But there are some obvious virtues to having a body of knowledge organized in an atopical fashion. You get a piece of knowledge, like 'a rolling stone gathers no moss,' which is in the first instance correct about something. If you paraphrase it into some particular domain, like "a man who doesn't settle down doesn't gather possessions," then it may not have the same kind of correctness; it may be questionable. And as I mentioned earlier, one of the most striking things about proverbs is that while on any occasion of use they may be, for example, inappropriate, people do not propose about them, "Is that so?" "What is your evidence for that?" If there is a question about them, it is in terms of, is it appropriate to apply that proverb to this person, activity, etc.? That is, proverbs are in the first place correct. And that can be accomplished by formulating a proverb from a domain within which it is correct, and having it always be used elsewhere. In that way, instead of constantly revising a body of knowledge by reference to the discovery that it's not correct here, now, for this, you maintain a stable body of knowledge and control the domain of its use.

I've already mentioned the feature of 'single-sentence packing' for proverbs. Let me offer a few more remarks. It's the case that both maxims and descriptions can be produced as proverbs, formulable as single sentences. "A woman's place is in the home" is an instance of the former, and for the latter, they are frequently those 'proverbial phrases,' "stacking the deck," "hanging by a thread," "barking up the wrong tree," etc. Both types of knowledge,

then, can be had and used via the single sentence, and thus it's not necessary to have some combination of sentences so as to minimally understand and transmit such information. Having that, you have a setup designed to permit you to learn new members of that class of information much more quickly than might be otherwise possible. That is to say, at that point when children can make single sentences, their task is now to see what it is that can be packed into that form they've learned. And that provides that they will have solved the theoretical problems of being able to know norms, or know knowledge. They would not then be faced with such a task as learning which set of sentences can constitute a piece of knowledge. Rather, once the single sentence is gotten, a whole series of things can be fitted to it, instead of having to deal with various combinations, which might set up quite different sorts of tasks.

In this regard, an extremely important thing about proverbs is that they have the character of being *potentially* descriptive or relevant. Persons learn them and have them available for use. They don't, that is, learn them on the occasion of their appropriate use. We could imagine that humans were built such that their language was alike to that of other animals, and to the way in which young children very heavily use language; either as narrative comment on what they're doing, "Now I'm putting on my shoe," or only uttering something on the occasion that it's appropriate – though it may be wrong, they could say "That's mommy" and it's not mommy; that is, the domain of application would be correct or incorrect, but the thing is not uttered apart from some possibly appropriate occasion. But you can have these potential descriptions and see them as 'correct for something,' where what it would be correct for remains to be seen.

And if you watch kids learning language, then learning that sort of thing seems to be an important part of it. Observations have been made of children talking to themselves before they fall asleep. And it's been found that they're not coming out with a bunch of random noises, but with a training procedure. For example, they've been observed doing exercises in phonetics, combining and assembling phonemes. I don't think it's been pointed out that once they have words, they play with combinations of terms that involve building possible descriptions. We could say it would be strictly a matter of learning the linguistic features of the language – learning the language in this very technical sense – that kids begin to use, in close relation to each other, the paired antonyms (things like in–out, up–down, etc.); that is, to produce these paired items as pairs. However, if they not only did that, but did – as I think they do – use them in proper sequence, then we've got them learning something more. They're learning potential descriptions. That is, they don't say, for example, "He fixed it, he broke it," but "He broke it, he fixed it." And for such things as in–out, which in some cases have proper sequences and you don't turn them around, then they do them in proper sequence, "Kitty got into the box, he got out." And if they do turn them around, they do it properly: "Kitty got out of the box, he got in again." They're learning, then, not only the relation of certain types of words, but that strings of words can

assemble potential descriptions, only in certain arrangements. And that is to say, they're learning that there is a correct way of assembling potential descriptions, apart from the particular occasions of their use.

Now, the phenomenon of 'potential description' has a variety of special consequences. One of them is that it sets up the possibility of a logic which involves examining statements apart from an occasion of use – and by 'an occasion of use' I mean an application to some actual situation, not, for example, an attempt to make a proof. Another is something which I had to be brought to see as noticeable, and that is the possibility of literature; stuff that is about nothing in particular, in which an author isn't talking about any actual set of events. It occurred to me that the phenomenon of 'the possibility of literature' is something noticeable while I was looking at psychiatric reports about delusions that patients have. In these reports, the writers take it that the delusions are understandable, though what makes them 'delusions' is that they couldn't possibly describe something. Literature has a similar character; it's composed of possible potential descriptions and possible potential rules, and a reader can look at assembled strings of language and decide that it's 'realistic' or 'not realistic,' compelling or not compelling. And in that sense, the possibility of literature and the possibility of logic are very, very closely related.

These sorts of considerations may have a bearing on a classical controversy, mainly within linguistics, which concerns the question: Are grammar and meaning separable? It may be that "Are they separable?" is not the problem, but that if 'meaning' is, in part, reference to something, and grammar is understandable apart from reference to anything – that is, formally correct in some way – then it's not simply a technological linguistic question, whether it's so that they're separable, but that it's an essential fact of language that they are separate.

Lecture 14
The Inference-Making Machine

(1) A: Yeah, then what happened?
(2) B: Okay, in the meantime she [wife of B] says, "Don't ask the child nothing." Well, she stepped between me and the child, and I got up to walk out the door. When she stepped between me and the child, I went to move her out of the way. And then about that time her sister had called the police. I don't know how she . . . what she . . .
(3) A: Didn't you smack her one?
(4) B: No.
(5) A: You're not telling me the story, Mr B.
(6) B: Well, you see when you say smack you mean hit.
(7) A: Yeah, you shoved her. Is that it?
(8) B: Yeah, I shoved her.

One of the basic things I want to be able to give you is an aesthetic for social life. By that I mean in part that we should have some sense of where it is deep, and be able to see, and to pose, problems. I'll try to do somewhat more than that. I'll also try to develop a variety of notions of what kind of business sociology is, what its problems look like, what the form of the solutions to those problems are, and perhaps to some extent, some of those solutions.

The kind of phenomena we are dealing with are always transcriptions of actual occurrences, in their actual sequence. And I take it our business is to try to construct the machinery that would produce those occurrences. That is, we find and name some objects, and find and name some rules for using those objects, where the rules for using those objects will produce those objects. And we also consider conversation per se, looking at the rules for sequencing in conversation.

The quotation I started off with comes at about the fifth interchange into a first telephone conversation, where A is a staff member of a social agency that B has called. B was told to call this agency because of some marital troubles he's having. A doesn't know anything about B's marital troubles, except what B tells him. So apart from the four or five previous interchanges,

---

these persons do not know each other, they've never met. And – though it's not exactly correct to say it this way – we find that "nonetheless," given essentially B's statement number (2), A is able to have some notion of what it is that has happened, in a story that he has only heard part of. Without knowing B at all, hearing "When she stepped between me and the child, I went to move her out of the way. And then about that time her sister had called the police," A can say, "Didn't you smack her one?"

And there is more to it than that. Because it would be one thing if A had some expectation about what the sequences of events were that brought on the coming of the police, where A would use that expectation to make a guess, but if it turns out that he's told it's not so, then so far as he knows, it's not so. But apparently A has a stronger grasp of the situation already, in the sense that it's not merely that he can have a guess, but that he takes it that – perhaps without regard to what B tells him – his guess is correct.

And we can notice that the fact that A has a guess here is not anything very extraordinary for *B.* He doesn't say, as a person sometimes says, "What makes you say that?" He says "No." And when it's proposed that his "No" is not correct, he doesn't say, "Look, I'm telling the story. How the hell would *you* know?" (Parenthetically, when I say "He doesn't say . . .," that is a rhetorical device on my part for loosening things up. I don't mean it in a serious sense. I am not making a statement that is intendedly descriptive. To propose seriously, descriptively, 'B doesn't say X' is another order of proposition.) But B takes it that A does know, and B corrects himself.

Furthermore, A is able to see as well, that B "isn't telling the story." And I want to briefly focus on that kind of thing: Seeing lies. I want mainly to focus on it because it seems that adult intuition may be misleading in trying to see what the problem is that seeing lies poses. In one of the early classics of psychoanalysis, a paper entitled 'On the origin of the influencing machine in schizophrenia,' which was published in English in the *Psychoanalytic Quarterly*, volume 2, in 1933, Victor Tausk reports on one of his patients. The patient was a young schizophrenic girl, and one of her symptoms he found in the following way. He often questioned her, and one time when he was questioning her she started laughing at him. He asked, "What are you laughing at?" She said, "Why do you always ask me questions? After all, you know what I'm thinking."

And Tausk worked at this symptom, that schizophrenics think other persons know their thoughts. The problem had been posed: How is it that schizophrenics come to think that others know their thoughts? And he tries to solve this problem. Now, Freud's comments upon the presentation of the paper are included in the journal publication. He says, "That's not the problem at all. After all, when you learn at least your first language, you learn it from your parents, from adults. And children must take it that adults, giving them the concepts, know how they're being used; know how the child is using them. So the problem is not how is it that people come to think that others know their thoughts, but how is it that people come to think so deeply that others don't know their thoughts?" Then, in a characteristic type of

observation, Freud says that the crucial event is the first successful lie. That event must be traumatic. The kid must have to say, "My God, they don't know what's going on!"

Whether that's so or not, I certainly don't know. But intuitively I take it that most adults don't see things that way, and that it's certainly not an inconceivable formulation. And the interchange we're looking at has a form which is very characteristic between adults and children; that is, the mother says to the child, "What were you doing?" the child gives some answer, the mother – who wasn't there – says, "No you weren't," and the child then corrects itself. And again, it isn't the case that persons proposing that one is lying, or "not telling the story;" are treated as doing something quite extraordinary.

Now let's try to begin to consider what our task is if we're going to build a machine that could in the first place produce this conclusion, "Didn't you smack her one?," with this piece of information, "When she stepped between me and the child, I went to move her out of the way. And then about that time her sister had called the police."

A first rule of procedure in doing analysis, a rule that you absolutely must use or you can't do the work, is this: In setting up what it is that seems to have happened, preparatory to solving the problem, do not let your notion of what could conceivably happen decide for you what must have happened. So, for example, when we get this kind of conclusion drawn at statement (3), you might say to yourself, how in the world could anybody think so fast? Because this just comes off. There is no pause more than three seconds between (2) and (3). You're going to say, "How? People aren't that smart." And therefore what happened must be something very simple; something which will require only a simple solution.

And that leads to our second rule. There is no necessary fit between the complexity or simplicity of the apparatus you need to construct some object, and the face-value complexity or simplicity of the object. These are things which you have to come to terms with, given the fact that this has indeed occurred. And insofar as people are doing lay affairs, they walk around with the notion that if somebody does something pretty simply, pretty quickly, or pretty routinely, then it must not be much of a problem to explain what they've done. There is no reason to suppose that is so. I'll give an analogical observation. In a recent review of a book attempting to describe the production of sentences in the English language – a grammar, in short – the reviewer observes that the grammar, though it's not bad, is not terribly successful, and it remains a fact that those sentences which any six-year old is able to produce routinely, have not yet been adequately described by some persons who are obviously enormously brilliant scientists. Of course the activities that molecules are able to engage in quickly, routinely, have not been described by enormously brilliant scientists. So don't worry about the brains that these persons couldn't have but which the objects seem to require. Our task is, in this sense, to build their brains.

Now, what features do we need to build into this machine? the first thing of course, is that it is an 'inference-making machine.' That is to say, it can deal

with and categorize and make statements about an event it has not seen. And the first thing about the sort of events it can handle is that they can be sequential events. In the interchange we're looking at, if we keep things very simple what we see is that if we have (a), (b) . . . (d), then if we suppose that A is a user of the machine we're going to have to build, he can find what (c) is. He is not merely in a position to make a guess about (c), but there are stronger features to this machine. As I said earlier, it's not that he guesses something, is told "No" and says "Okay." For him, there is some fit operating between (a), (b), (c), and (d) such that the fact that he's told that what he proposes as (c) has not occurred does not constrain what he can continue to insist on; that it was *that* (c) which occurred. And you can just quickly contrast that to the situation of a riddle. I ask you a riddle and invite you to give an answer. You give an answer and I say "No, the answer is . . ." something else. And by definition that's the answer. Where people do riddles you don't get an insistence, "No, I'm right." The inference-making machine we are building can handle riddles, but riddles set up a simpler task than those which this machine is capable of handling.

Now let's begin to examine, in a rather informal way, how it is that the machine-user, A, seems to make conclusion (3), "Didn't you smack her one?" and then (5), "You're not telling me the story, Mr B." And here we can use that information which we have as members of the same society that these two people are in. What we have is roughly something like this: A knows that the scene is 'a family problem.' So (a) is the family quarrel, (b) is the guy moving to the door . . . (d) is the police coming. And (c) is the grounds for the police to have come. That is, apparently on some piece of information the police have come, and that piece of information is the thing that A has guessed at. A apparently knows, then, what good grounds are for the police to be called to a scene. And he's able to use those good grounds, first to make a guess, and then to assess the correctness of the answer to that guess.

We can note as well that it's not simply the case that A and B don't know each other, but we have a set of other persons who are being talked about, and A is listening to this. Whatever A knows about B, he certainly knows less about these others. A knows essentially only the set of terms that B uses to name them; that is, that there is something called a sister, something called a wife, something called a child. It seems to me that the information that is being used by A is held in terms of collections of these categories. For one, you can easily enough come to see that for any population of persons present there are available alternative sets of categories that can be used on them. That then poses for us an utterly central task in our descriptions; to have some way of providing which set of categories operate in some scene – in the reporting of that scene or in its treatment as it is occurring.

To get a sense of the way in which the inferences that can be made from a story are geared to these categories, we could try, for example, using different categories. What if it were, not "her sister," but 'a neighbor' who had called the police? A possible inference in that case would be that the grounds for calling the police had something to do with 'creating a

disturbance;' crying child, husband and wife yelling at each other. Or, for example, just shuffle the one category around a little bit. Would the same inference be made if it was 'my' sister, not "her" sister who had called the police? The rules with respect to who owes what to whom, and who takes care of whom may be so formulated that those things matter a great deal. The inference in this case might then be, not that the husband had produced some activity which served as good grounds for calling the police, but that the wife had done so.

And that is extremely important because it is an awesome machine if one needs to know only that it is "my wife" and "her sister." And you can do this because that holds for every like unit in society, such that you don't need to ask for example, "Well tell me some more about your wife's sister, is she elderly? Is she prone to hysterics?" which is something that would be absolutely essential in psychology. But if something like what I've been saying is so, then: It is not merely that the notion that you need to know a great deal about somebody before you can say this or that about them may be a lot of nonsense, but the way that society goes about building people *makes* a nonsense of such a notion. That is: A task of socialization is to produce somebody who so behaves that those categories are enough to know something about him.

One of the things we always want to be watching for is to see how simple or how complex this animal is. In this regard I'll raise a question but not attempt to answer it here. There is what we can call an 'order of depth' in dealing with various kinds of occurrences. So, for example, we can say about A here that there can be a list of good grounds for police to be called to a scene, and that list is built into his brain as a mature member of the society, and he can, when told of some scene where the police come, now throw out an item from that list as a guess, and perhaps furthermore insist on it being correct. That would be one order of depth. But for the issue of how simple or complex this animal is, we can notice that, for example, for dealing with such a situation as 'the police arriving on the scene,' we need a machine; a set of rules, that is, and a set of objects that those rules handle. We can then ask, is that machine altogether distinct, such that if something else happens, we need another machine for making another kind of inference, etc., etc.? Or will it be the case that this use of an inference from the 'police' situation will be absolutely similar to the way in which some other event is found? Then 'police' just becomes one category of a general machine that handles a whole set of things. If that is so, then the task of describing how this animal operates will be tremendously simplified. And the work of the animal itself is, of course, tremendously simplified.

What we're working with, for now, is that apparently A knows what the good grounds are for the police to come, and uses those good grounds to monitor what B tells him, and makes a guess and then challenges B's assertion that he's wrong. I want show how this stuff can cut; how it can be interesting. For example, it's clearly the case – A knows it and B knows it – that the police don't only come for the good grounds that police come for. Cranks call

up the police all the time. And police answer calls that turn out not to be based on good grounds. But apparently that fact has a special status. The proper ways that the police come to some house are available to Members in general, and it is those which may be used, for example, to decide what happened at that house. And if you see somebody being led away by the police, you may quite naturally feel that you know what's up with him, at least generically; that is, that he's 'done something wrong.'

Now that suggests two things: First, the fact that some procedure which has a correct way of getting done, gets done correctly – independent of any issue of police answering calls that are not based on good grounds, or any issue of people getting harassed or misunderstood – may be quite crucial in permitting persons to find the sense of an event which happened by reference to those procedures. And second – and here we're going to pose one of the central dilemmas of Western civilization – a person who stands in the position of having some procedure which has a correct basis for use applied to them, stands in the position of having that procedure presumptively correctly applied. And we can give that problem a name: Job's Problem.

Job, the rich, good man, had lost all his wealth, his children, all his possessions. His friends come to him, and there are series of long discussions. What his friends propose is, look, you take it that God punishes the wicked and rewards the good. We take it the same way. Your situation is understandable only if you're guilty. So confess. And for Job the question is, "I don't know that I'm guilty. I'm convinced that I'm not guilty. But then how could this have happened to me?"

A central dilemma, then, is that some procedure which has a proper way of operating, may not so operate. Kafka is dealing with the same kind of issue. And Mr B here is in the same boat. What A suspects may indeed have happened. Or B may have just felt . . . what can he say? After all, A knows how those things happen, and how is B going to insist that it's not so? That is, a problem that people in a range of circumstances can be faced with is: Is there a way available to provide from some event to have happened, apart from the normal and proper way these things happen? We are talking about something quite general here. Talking about it by reference to the police doesn't mean we are talking about a procedure set up by and for the police. Rather, it may be the case that in order for the police to operate successfully, they have to be able to produce their activities such that these ways that Members have of looking at activities can be applied to the police. Likewise, when I talk about Job, I'm not trying to deal with literary criticism. Job's problem focusses on a central problem in the way that persons go about orienting to the occurrence of events, and that is, that it is somehow extremely important that the inferences they do make can be taken as correct, and thereby that those persons who produce those activities which are described by these sequences so behave as to provide for the fact that these sequences do describe them.

In that regard it is interesting to note that the phenomenon of presumptively correct descriptions, and behavior produced to fit those descriptions, can

be found by reference to illegitimate as well as legitimate activities. So, for example, in his book *Order and Rebellion in Tribal Africa*, in the chapter 'The reasonable man in Barotse law,' Gluckman offers us the 'reasonable wrong-doer.'

> The last case suggests that the Barotse have a picture not only of reasonable and customary right ways of behaving, but also a picture of the reasonable wrongdoer – the reasonable thief, adulterer, slanderer, and so forth.
>   By this paradox – the reasonable wrongdoer – I sum up the fact that wrongdoers in any society also behave in customary ways which are socially stereotyped. There is the 'criminal slouch' as against the 'scholarly stoop,' the spiv's clothes and hairstyle, the whole manner of loitering with intent to commit a criminal action.
>   When there is only circumstantial evidence, these sorts of actions build up before the judges until they conclude that . . . the total picture is that of a reasonable wrongdoer; as we say, a person guilty beyond reasonable doubt.
>   And I have heard cases which indicate that these customary ways of doing wrong in fact influence adulterers and thieves, so that they give themselves away in circumstances in which they could have acted so as to cover up their misdeeds.

Our task, then, is not simply to be building a machine which can make inferences, and make them in the strong way that I've proposed. A problem for a sociology interested in describing socialization will consist in large part of how it is that a human gets built who will produce his activities such that they're graspable in this way. That is to say, how it is that he'll behave such that these sequencing machines can be used to find out what he's up to. Under that notion, then, we would propose that at least one core focus for trouble would be persons who are so socialized that they don't permit these sequencing machines to be used on them. And that is one way that 'psychopathic personalities' behave. If you read Cleckley's book *The Mask of Sanity*, the psychopathic personality is reported to be that person who, at any given point in their behavior, you never know what's going to happen next. You're never able to say "Here is an nth point in this sequence, and now X, Y, and Z will come." And they are taken to be about as painful a person as you can have around you.

Now, what I have been proposing could be restated as follows: For Members, activities are observables. They see activities. They see persons doing intimacy, they see persons lying, etc. (It has been wrongly proposed that people do not see, for example, 'my mother,' but what they 'really see' is light, dark, shadows, an object in the distance, etc.) And that poses for us the task of being behaviorists in this sense: Finding how it is that people can produce sets of actions that provide that others can see such things.

Earlier I observed that one way that persons go about seeing activities is by reference to some procedures which they take it properly occur as the activities occur. That is, it can be seen that Mr B "smacked" his wife by virtue of the fact that the police came, by virtue of the fact that the police come when people smack their wives. While in many of its aspects the use of procedures to find the sense of some set of observables – that is, the phenomenon I'm calling Job's Problem – is utterly central, this fact of observability of actions is much more generic.

We can be led, then, to investigate, for example, how it is that persons learn that by virtue of their appearances, the activities they have gone through are observable. Where, again, this observability is not specific to each activity, but is learned as a general phenomenon. And we could suppose that the following sort of report might be the sort of thing we could use to find out how this learning takes place, and to see where those things may or may not be difficult. I will take this utterly mundane report and suggest some of its relevance. It is a quotation from *One Boy's Day* by Barker and Wright (1951). What they did was to have a bunch of people follow a kid around all day, writing down as best they could, everything that he did. They worked in half-hour shifts, and they compiled, then, a record of his day.

> 7:20 Raymond got up from his chair. He went directly out of the kitchen and into the bathroom.
>   Coming from the bathroom, he returned to the kitchen. His mother asked pleasantly, "Did you wash your teeth?" Mr Birch looked at him and laughed saying, "My gosh, son, you have tooth powder all over your cheeks." Then both parents laughed heartily.
>   Raymond turned instantly and went straight to the bathroom. He smiled as though he were not upset by his parents' comments.
>   He stayed in the bathroom just a few seconds.
>   He came back rubbing his face with his hands. The tooth powder was no longer visible.

Presumably Raymond can learn through things like this, that his parents can tell that he washed his teeth by virtue of the appearance on his face of tooth powder. And that fact sets up the phenomeon which I'll call generically, 'subversion.' With this example in hand one can think quite rapidly of the way that children can learn subversion, having learned that the procedure is applied to them. For example, they will wash those aspects of their body which are at a glance observable, so when they appear, it seems "Oh, you washed." And the fact that that adaptation goes on, provides, then, the sense in which they orient to this way that their activities are grasped.

Now, in watching these obviously trivial things that children might do, it is conceivable that one may have analyzed matters that are treated as being of larger moment. So, for example, the quotation I just gave, in which Raymond's having brushed his teeth was seen in his face covered with some

white powder, is in its character extremely central, and deserves the name 'generic.' Simply enough, the first human event in Judaic-Christian mythology consists of man's discovery that his moral character is observable. We might call it Adam's Problem.

(Genesis, 3.6–12, King James Version)

And when the woman saw that the tree was good for food, and that it was pleasant to the eyes, and a tree to be desired to make wise, she took of the fruit thereof, and did eat, and gave also unto her husband with her; and he did eat. And the eyes of them both were opened, and they knew that they were naked; and they sewed fig leaves together, and made themselves aprons.

And they heard the voice of the Lord God walking in the garden in the cool of the day; and Adam and his wife hid themselves from the presence of the Lord God amongst the trees of the garden.

And the Lord God called unto Adam, and said unto him, Where art thou?

And he said, I heard Thy voice in the garden, and I was afraid, because I was naked; and I hid myself.

And He said, who told thee that thou was naked? Hast thou eaten of the tree whereof I commanded thee that thou should not eat?

And the man said, the woman whom Thou gavest to be with me, she gave me of the tree, and I did eat.

And Adam learns, like Raymond learns, that one has to come to terms with the fact that from one's appearances the activities that one has engaged in are observable.

Let me mention one further thing, which is again relevant to the conversation we're examining. The matter I'll be dealing with is one which you might not, given the way one goes about considering scientific materials, formulate in the way I'm going to. When we think about facts, insofar as we are thinking of scientific facts, we tend to pose problems in the following way: If it's the case that something has occurred, then our problem is to explain it. Now, with such things as lies, untruths, confabulations – the possibility of which persons are often attending to – we've got to notice that something like a reverse procedure is very much used. The reverse procedure consists of the following. In deciding among possible competing facts, one may decide that that fact occurred which has an explanation, and that fact that hasn't an explanation did not occur. Here is a beautiful instance of this way of proceeding. It comes from an arbitration case involving a company which discharged some of its employees for causing a disturbance. Here's what the arbitrator writes:

(Shulman Decision A-70 Ford-UAW Arbitration)

The story of the other discharged employees approaches the bizarre. Twelve of them testified before me. Each of them claims to be a completely innocent bystander, wholly at a loss to understand why he was picked up for discharge. None of them admits being part of the crowd in any of the demonstrations. None of them admits even the normal curiosity of an innocent bystander. Each claims that he knew very little about the cause of the stoppages, and cared even less after learning the cause. Each claims that when the lights went out or the line stopped he asked his foreman what to do and on being told to stay or go home as he pleased but that his time stopped in any event, he left for home. One of the men, a lively young boxer, asserts that after seeing the crowd and the excitement he calmly repaired to a warm, comfortable spot and went to sleep. He did this, he asserts, on two of the three days (being absent on the third), and slept the peaceful sleep of the just, until the excitement completely quieted down. All, it seems were veritable angels, above and beyond contagion by the excitement in the department.

Now there unquestionably were serious stoppages in Department 84 on November 5th, 6th, and 8th. There were vociferous and angry men milling around and demanding action. Who were the incensed men who did take part? Who were the angry men who were so difficult to get back to work and were so incensed that, the union claims, they turned against their own committeemen and even assaulted two of them? How, indeed, were these fourteen chosen?

The union advanced no explanation. There is no suggestion that these men were chosen by lot. And even such a method would normally be expected to catch some of the guilty. And there is no basis whatever in the evidence to suppose that the men were selected because of any personal animosity against them, with the slight possible exception of one man. Nor are the men generally regarded as troublemakers, of whom the company would be glad to be rid.

The company's explanation is simple and without any contradiction other than the incredible stories related by the men themselves. The labor relations conciliator, with the help of his assistant, took the names or the badge numbers of the most active men in the crowds that demonstrated in his office. This accounts for twelve of the fourteen.

. . . Under these circumstances I cannot give credence to the men's protestations of innocence.

In this case the two competing facts are that a group of employees are innocent, were wrongfully discharged, and that they are guilty, discharged on good grounds. If they are innocent, there is "no explanation" for their being selected to be fired. If they are guilty, then the "explanation is simple and without any contradiction." The finding is that they are guilty. Here is another instance of that sort of procedure, taken from a coroner's report. The competing facts in this case are death by suicide or accident.

> While Mrs S.'s drinking during the past twenty years may be symptomatic of problems, there was nothing in the history to indicate any sudden change in her life pattern, or any unfortunate or untimely occurrence in her life. And therefore there seems to be no reason why she should have chosen this particular time to end her life.

That is to say, since there is no reason for her to have ended her life, she didn't end her life.

This gets very, very subtle and curious at times, where you find the following kind of situation. One recurrently problematic kind of death involves alcohol and pills in some combination, where alcohol and pills in combination are extremely deadly. That is to say, given some amount of alcohol, far less pills are necessary to kill somebody than without alcohol. And where persons die of alcohol and pills, with a few pills, then you get something like the following argument proposed: It's not suicide, it's an accident, because if they wanted to kill themselves they would have taken all the pills they had, and they didn't take them all. To which you might say, well, but they did die, and maybe what they did was to kill themselves in a perfectly efficient way.

One of the nicest cases I have is from the autobiography of an ex-mental patient. It's a very long description so I'll give it in condensed form. He's just committed himself, he's been there maybe a day or two and now he wants to inform his family, but nobody will let him out of the ward to make a phone call. He finally asks a doctor, who tells him "Wait here five minutes, I'll look for your file. If I find it you can be let out to make a phone call." So he waits. He stands there waiting for five hours. At some point a nurse comes by and tells him to move away because he's blocking the door. He says, "No, I have instructions to stay here." She says "From who?" He says "From the doctor." The nurse goes off and gets the head nurse, who asks him "Why do you refuse to move from that spot?" He says "Because the doctor told me to wait here." The head nurse, as he notes, "couldn't assume the risk of overruling the doctor" so she leaves and returns a few minutes later with her supervisor. Here is the conversation with the supervisor.

> "Which doctor," she asked, "told you to stand there?"
> "I don't know, he didn't tell me his name."
> "How long ago," asked the supervisor, "did the doctor tell you to stand there?"
> "It must be about five hours ago," I replied.
> "Do you expect us to believe that a doctor whose name you don't even know told you to wait there five hours ago and that he hasn't come back yet?"
> I remained silent. The question was extremely sharp, and I winced under its impact.
> "Are you sure that the doctor is not just a figment of your imagination?"

I must admit that my confidence was shaken. I began to doubt, myself, that this had happened. Plainly doctors don't break their promises. If one of them tells you that he'll return in five minutes, he won't keep you waiting for five hours. Such things just don't happen.

"I must be crazy," I said weakly, "Maybe it didn't happen."

The supervisor nodded. "That's better," she said grimly.

My head reeled and my legs tottered. I was beginning to feel like the prisoner who is kept in a padded cell for years without ever being informed of the charges against him in Kafka's novel *The Trial*. Everything was turning topsy-turvy. Guilt was innocence and innocence was guilt. Nothing admitted of any rational explanation. If that doctor who had told me to wait for him for five minutes were merely a figment of my imagination, then I was losing all contact with reality. But if that doctor really had existed, then why did all these people maintain that he didn't? I knew that he existed. I had seen him and spoken to him. Then all these people must be engaged in a monstrous conspiracy to drive me mad. No other theory seemed to fit these facts.

The supervisor interrupted my thoughts. "Come with me," she said.

I obeyed meekly and followed her towards the center of the hallway.

"You're very confused, young man," said the supervisor. "Because you're new here I won't report how you've just behaved. But I warn you, don't do it again. I want no further trouble from you."

Again, then, we see the use of this procedure – that one can choose among facts according to the presence or absence of an explanation. It's absolutely routinely used. I'm not proposing that it's obscene, I'm only proposing that that's the way it's done. At least in this society, facts and explanations have more than a one-way relation to each other. That is, it isn't the case that if something has occurred, that sets the problem 'construct an explanation,' but the notion that persons hold of possible facts is that those facts are possible for which there is an explanation. One can't merely say "Well, I saw it. You explain it." Something proposed to have occurred can be treated as not so, by virtue of the fact that there's not an explanation for it. That's important in this society, given the fact that miracles are no longer usable. And miracles are that class, in part. They're events for which there is no account, which now systematically would be given an account, i.e., an account not of this world. But most persons who consider themselves to be modern individuals don't read, for example, the psychical researcher, Rhine. They just take it that whatever he says, he's a fraud in one way or another, and you don't have to bother coming to terms with what he reports. Given that what he proposes as an explanation couldn't be an explanation, then it hasn't occurred. And further, there is an explanation available which provides that there is no such phenomenon: Statistical chance. Such an explanation proposes that out of a population there will be some persons who produce these responses, and he's happened to have found them. But that does not provide any basis for psychic research; random distributions would do the same job.

That's a classical problem. It can always be raised if you have a limited amount of research, where, then, if you propose there's a phenomenon, it is said that you have nothing but the working of a random distribution, which you happen to have caught at some point. And it's raised more than occasionally about psychic research, and I suppose more than occasionally it turns out to be relevant. Or, for example, people say "How does it happen that there have been two earthquakes on this day?" and then they go about constructing some explanation: The gods are angry. Or, "Isn't it odd that the weather pattern has changed this year?" and then they construct an explanation: Fallout. And now what's proposed is that if you use such a unit as 'years' to measure weather, where weather as a phenomenon has to be measured over eons, then you're liable to find something which looks like order. But given the proper unit, that proposed order is not present. Now, there are all sorts of units available, and for any proposed phenomenon, that unit which would make that proposed ordered set of facts simply a coagulation of random events can be proposed to be the relevant unit. Either side may be right or wrong. Nonetheless it's done.

Appendix A
A Note on the Editing

In lecture 2, p. 17, Sacks introduces a consideration:

> A recurrent thing that I've seen throughout this stuff is persons talking
> about not feeling wanted anymore. The question is, how is that kind of
> feeling provided for in this society? And what would be interesting
> about it would be if we could see some way in which, quote, the
> structure of society, provided for the focusing of kinds of troubles.
> That's what I think we can see with this . . .

Throughout this volume many of Sacks' pronominal uses have been changed.
Here, the operation is more or less innocuous. What is rendered as '. . . if *we*
could see . . ." and "That's what I think *we* can see . . ." actually goes,
". . . if *we* could see . . ." and "That's what I think *you* can see . . . ;" i.e., the
second 'we' is actually 'you.' Following is the unedited version. (Emphasis on
pronouns is always added: it is not in the transcripts.)

> Now, a recurrent thing that you have probably seen, and I've seen
> throughout this stuff, is persons talking about not feeling wanted
> anymore. The question is, how is that kind of feeling provided for in
> this society. And what would be interesting about it is, if *we* could see
> some way in which, quote, the structure of society provided for the
> focussing of kinds of troubles. That's what I think *you* can see with this.
> <div align="right">(Fall 1964, tape 5, side 1, p. 10, unedited)</div>

And this 'we'/'you' alternation is preserved in the abbreviated earlier
transcript (transcriber unknown).

> The recurrent thing is people talking about not feeling wanted. How is
> that kind of feeling is [sic] provided for in this society? If *we* can see
> some way in which the structure of society provided for the focusing of
> certain kinds of troubles. That's what *you* can see above.
> <div align="right">(Fall 1964, tape 5, side 1, pp. 3–4, transcriber unknown)</div>

Another 'you'/'we' alternation occurs just a bit further in the discussion. Here
is the unedited version.

> Now *you* see that what she's picking up here is, quote, the absence of
> ceremonials. Now, *we* see that ceremonials have this double use.
> <div align="right">(Fall 1964, tape 5, side 1, pp. 10–11, unedited)</div>

(Neither the edited version nor the earlier transcript show the repeated, pronoun-alternated reference to 'seeing.' The edited version has it:

> What she's picking up here is the absence of ceremonials. And ceremonials have this double use.
>
>   (Fall 1964–Spring 1965, lecture 2, p. 18)

And the earlier transcript goes:

> She picks up the absence of ceremonials. Ceremonials have a double use.
>
>   (Fall 1964, tape 5, side 1, p. 4, transcriber unknown)

So, in close order there are two of these pronominal alternations: ". . . if *we* could see . . . '/'I think *you* can see" and "Now *you* see . . ."/"Now, *we* see . . ." And such alternation is recurrent across the lectures. Following are a few instances, taken from the Fall 1964 and Spring 1966 unedited lecture transcripts.

> Now, what *you* can see is this . . . And what *we* find is . . .
>
>   (Fall 1964, tape 1(R), p. 6, unedited)

This cross-paragraph alternation survives in the edited version (Fall 1964–Spring 1965, lecture 1, pp. 6–7).

> If *you* look at [X and Y] what *we* seem to find in them is . . .
>
>   (Fall 1964, tape 4, side 2(?), p. 1, unedited)

This alternation is edited out and rendered as: "What we find in [X and Y] is . . ." (Fall 1964–Spring 1965, lecture 7, p. 54).

> *I* could say [X is the case] but *I* wouldn't be able to show why that's so, or how it's so. If that's the case, *I* don't establish my point. *I* could say [Y] and *we* could [find A but not B]. That again wouldn't do what *we* propose to do. *We* want to do both: [A and B]. *You* want a method that generates this.
>
>   (Spring 1966, lecture 4, pp. 1–2, unedited)

In the edited version, a 'we' referring to 'I' is changed to 'I' ("That, again, wouldn't do what *I* propose to do"), and a 'you' following a prior 'we' is changed to 'we' ("*We* want to do both: [A and B] . . . *we* want a method that generates this line. (Spring 1966, lecture 4, p. 301).

> In short, what *you* want to do is [X]. And *we* can take it that [Y].
>
>   (Spring 1966, lecture 21, p. 6, unedited)

This alternation survives in the edited version (Spring 1966, lecture 21, p. 420).

If *you* can claim that it could be another thing, first *one* wants to show how it's another possibility.

> (Spring 1966, lecture 22, p. 2, unedited)

This alternation is revised to, "If *one* is claiming that it could be another thing, first *one* wants to show how it's another possibility" (Spring 1966, lecture 21, p. 422).

Many of the pronominal alternations are edited out or revised. One major basis of revision is an attempt to deal with the 'direct address' problem.

Sacks often addresses remarks directly to the class, as occurs in the unedited transcript of the paragraph in question here:

> Now, a recurrent thing that you have probably seen, and I've seen throughout this stuff . . .

He also makes such meta remarks as, "I would like very if you could collect instances of the uses of [X]" (Fall 1964, tape 4, side 2, p. 11, unedited). '. . . if it isn't clear, stick up your hand and tell me" (Fall 1964, tape 1, p. 2, unedited), not to mention things like "Oh by the way. Somebody tell me when I get − I don't have a watch. So just keep me vaguely informed about (   )" (Fall 1964, tape 1, p. 9, unedited). These have been edited out.

But also, lecture-relevant talk which was addressed to the class was often deleted or changed because it could be troublesome to readers, either estranging them, making them onlookers or overhearers, or over-intimatizing the talk, seeming to address this particular reader directly. So, e.g., such a remark as, "You ought by this time to be quite aware of the fact that . . ." (Spring 1966, lecture 6, p. 1, unedited) was changed to "By this time it ought to be quite obvious that . . . "(Spring 1966, lecture 6, p. 312). In the actual situation, of course, members of the class were neither overhearing, nor being individually addressed by, such utterances.

There are, then, variously problematic uses of 'you.' And the fact that Sacks not infrequently uses 'you,' 'one,' and 'we' in alternation became a resource − and license − for changing them. Most often 'you' was changed to 'we,' a word Sacks makes extensive use of, sometimes in rather idiosyncratic ways. So, for example, he will use 'we' where he himself is the referent, e.g.:

> That again, wouldn't do what we propose to do.
>> (Spring 1966, lecture 4, p. 2, unedited)

> Let's start out with something we mentioned before . . .
>> (Fall 1964, tape 14, side 2, p. 2, unedited)

> Remember we said about the opening lines of conversations that they seem to come in pairs.
>> (Fall 1964, tape 5, side 1, p. 3, unedited)

Now we originally introduced the notion of an omni-relevant device . . .
> (Fall 1966, lecture 4, p. 6, unedited)

in each case it being he himself who has "propose[d]," "mentioned," "said," and "introduced [a] notion."

In one case, Sacks recasts his own utterance:

> We haven't said that they have a right to be told. I have not said that they have a right to be told some trouble of A's.
> (Fall 1964, tape 10, side 2 (M3 side 2), p. 11, unedited)

And in the edited versions, either 'we' is changed to 'I:'

> That, again, wouldn't do what I propose to do.
> (Spring 1966, lecture 4, p. 301)

> I'll start out with something I'd already worked up . . .
> (Fall 1964–Spring 1965, lecture 8, p. 57)

> I said about the opening lines of conversations . . .
> (Fall 1964–Spring 1965, lecture 2, p. 13)

or the talk is revised to accommodate 'we:'

> We have now, the notion of an omni-relevant device . . .
> (Spring 1966, lecture 6, p. 316)

Sacks also uses 'we' to refer to pretty much anyone *but* himself, e.g.:

> Hopefully the thing I want us to see in this first is . . .
> (Fall 1964, tape 5, side 2, p. 1, unedited)

> I raise this because while we all can see that that's quite so, there's a related and in a way much more interesting thing that I doubt we've noticed . . .
> (Spring 1970, lecture 1, p. 7, unedited)

> We tend somewhat to be perhaps overly taken with the constraints that Weber sets for an objective social science . . .
> (Spring 1966, lecture 33, p. 9, unedited)

where it is members of the class, and not Sacks, who will "hopefully" come to "see" something, and whom he can "doubt" have "noticed" something. And it may be an even larger population, but in any case one that doesn't include Sacks, whose members "tend to be perhaps overly taken with" Weber's constraints.

While these self-inclusive, 'we'-references may be incorrect in a strict sense, they may be doing the sort of work Sacks discusses in one of the lectures; that of saying 'everyone.'

> If someone who needn't include themself in some class . . . wants to say in a stronger way than 'you' (which can be misheard as only the recipient) that 'everyone is that way,' they can say 'we.'

He offers a case in which a psychiatrist remarks, "We can be very blind to the things around us," and goes on to say:

> That is, by virtue of the sequence in which 'we' is heard, the inclusion of the speaker is partially gratuitous; is heard as doing something he 'needn't have done.'
>
> (Spring 1966, lecture 11, pp. 351–2)

As it happens, in the edited versions those instances of "gratuitous" self-inclusion in the environment of a demand, ". . . I want us to see . . .," or criticism, ". . . there's . . . a much more interesting thing that I doubt we've noticed" and "We tend somewhat to be perhaps overly taken with [X]. . ." were preserved. (See Fall 1964–Spring 1965, lecture 3, p. 21, Spring 1970, lecture 1, p. 00, and Spring 1966, lecture 33, p. 487.)

In contrast to those pronominal changes mentioned earlier, both the changes from 'we' to 'I' when Sacks himself is the referent, and the preservation of the self-inclusive 'we' in the environment of touchy assertions, were not matters of policy; they were decided upon one at a time. But they can be seen to add up to something like policies, or perhaps to reflect underlying policies.

The paragraph at the start of this consideration, plus a bit of subsequent talk, happen to instance another phenomenon that was often revised. The unedited transcript shows a format, "quote, [X]," which occurs once,

> . . . if we could see some way in which, quote, the structure of society provided for the focussing of kinds of troubles . . .

and is then used again some 16 lines later.

> . . . what she's picking up here is, quote, the absence of ceremonials.

(These two fragments are from Fall 1964, tape 5, side 1, p. 10, ll. 4–6 and p. 10, l. 23–p. 11, l. 1, respectively. See p. 126 of this Appendix for fuller fragments of each.)

This phenomenon of a *repeated format* occurs throughout the lectures, and often – as here – one of them, usually the second, is deleted in the edited

version, for both aesthetic and technical reasons. Only the latter will be considered here.

One sort of technical problem posed by the repeated format is that a term which may appear to be analytically based, can be merely format generated. And a glimpse of that problem may be gotten from the recurrence of the term 'quote' in ". . . quote, the structure of society . . ." and ". . . quote, the absence of ceremonials." Roughly, the quote-marking of the familiar phrase 'the structure of society' seems to be doing its standard 'as they say' work, where a new way of working with an old concept is being offered. It is not clear what sort of work the quote-marking of the newly minted technical descriptor 'the absence of ceremonials' is doing. One could not in this case substitute 'as they say' for 'quote.' It may simply be a format-recurrence. In any event it was treated as such, and deleted from the edited version which simply goes: "What she's picking up here is the absence of ceremonials" (Fall 1964–Spring 1965, lecture 2, p. 18).

Part II
Fall 1965

Lectures 1 and 2
"The baby cried. The mommy picked it up."

Lectures 1 and 2 were not recorded, but Sacks had made preparatory notes for the "first lecture(s)" which seem to have turned out to cover lecture 1 (see Appendix A). The second lecture is covered in notes Sacks made after its delivery (see Appendix B).

Handout Group Therapy Session Segment

The door opens in the middle of a group therapy session, and in comes a new entrant. Until now, at this session, the members have been three teen age males, and a male therapist of around 35 years of age. The new entrant is a male teenager.

Time

0:00 *Therapist*: Bob this is uh Mel
      Bob: hi
      Th   Joe
      Bob   hi
      Joe   hi
      Th   Henry
      Henry   hi
      Bob   hi
      Th   Bob Reed
      Joe   (cough) We were in an automobile discussion,
      Henry   discussing the psychological motives for
      Mel   drag racing on the streets.
      Joe   I still say though that if you take, if you take uh a big fancy car out on the road and you're hot roddin' around you're you're bound to get, you're bound to get caught and you're bound to get shafted. We– look
      Mel   Now did you do it right. That's the challenge That's the challenge You wanna try
      Henry   That's the problem with society. Hahhh
      Mel   And do it right so you do not get caught.
      Henry   That's the
      Joe   In that Bonneville of mine? I could take it out with me and if I got a tie and a sweater on and I look clean? 99% of the time a guy could pull up to me in the same car the same color, the same year, the whole bit, roll up his pipes and he's in a dirty grubby tee shirt and the guy will pick the guy up in the dirty grubby tee shirt before I before he'll pick me up.

1:00   Just – just for –

This is as close a copy as possible of Sacks' transcript.

136

	Mel	Not many people get picked up in a Pontiac station wagon.
	Joe	Now I agree it looks like a daddy's – It looks like a damn mommy's car.
	Henry	Joe, face it. You're a poor little rich kid.
	Joe	Yes Mommy.
	Henry	Face the music
	Mel	Ok Now you've got that out of your system. Now you're a poor little rich kid we've told you that.
	Henry	And we also decided you're a chicken shit.
	Joe	I decided that years ago. Hell with you
	Mel	Now let's see what else can we decide about you?
	Henry	Hey don't tear him down
	Joe	I've been torn down for–
	Mel	ok
1:30	*Henry*	We got company
	Mel	oh ok. Tell us all about yourself so we can find something bad about you.
	Joe	Yeah. Hurry up.
	Henry	Well first of all you must be crazy or you wouldn't be here.
	Joe	heh heh
	Bob	Yeh I guess
	Mel	Secondly, you must be an under-achiever
	Bob	yea
	Henry	You hate your mom and dad, huh
	Mel	Third of all–
	Bob	oh sometimes
	Mel	Fourth, you like to drive cars fast.
	Bob	yea
	Mel	Fifth you like uh you like wild times
	Bob	Yeah
	Joe	He smokes like me see.
	Mel	Sixth, you like booze
	Bob	yeah
	Mel	Seventh you like to smoke
	Henry	And seven you've been arrested for rape and other things.
	Henry	Ha
	Mel	Eight you–
2:00	*Bob*	No. not that.
	Mel	Eight you Eight you give lip back to everybody.
	Bob	Yea
	Mel	Nine you uh cut classes.
	Bob	yea
	Mel	Ten, you've been kicked out of school once.
	Bob	yea

	Mel	eleven uh
	Joe	hah hahh
	Henry	We're doing better than he is. haha. Proceed, I'm with you. ha ha.
	Mel	Your turn.
	Henry	Are you just agreeing because you feel you want to or what?
	Bob	huh?
	Henry	You just agreeing?
	Bob	What the hells that?
	Mel	Agreeing
	Henry	Agreeing
	Bob	Agreen?
2:30	*Mel*	Agreeing. With us. Just going along with it.
	Bob	No.
	Henry	Saying Yes. Yes. hahhh
	Bob	Its true, heh, everything you said is true. so.
	Mel	You wouldn't be in this group if you didn't.
	Joe	What school did you go to?
	Bob	I went to Palisades
	Henry	Went?
	Bob	Yeah. And then University.
	Henry	Oh I went to Uni. I graduated there.
	Bob	You did?
	Henry	Bitchin school isn't it
	Bob	Yeah I guess
	Henry	Yeah I never did ( ) it
	Mel	What did you do with the matches?
	Henry	You don't like it do you?
	Joe	I got them
	Henry	Here you go chum
	Joe	Everybody's faster than me today
	Henry	You got reflexes like a slow turtle
	Joe	God damn you ha
3:00	*Henry*	Remind me later. I'll show you a litte game about your reflexes.
	Joe	Got any more cigars.
	Henry	No it's last one
	Joe	Last one
	Henry	Pity heh
	Henry	Usually there's a broad in here. Pretty –
	Joe	Her name's Barbara. She pretty good. She's real nice.
	Joe	(cough)
	Mel	A lot of her to love but
	Bob	Sounds like an old man
	Joe	Huh. This is the old, this is the couch society of what is it?

	Mel	Wanna join our army?
	Bob	hmmm?
3:30	Mel	Wanna join our army? We're gonna go defeat the king of Greece.
	Joe	We're gonna
	Mel	The academic counselling center fightin' army's gonna go
	Henry	Alright Mel, he's been here ten minutes
	Joe	Mel. Your match is still going Mel
	Henry	Mel He's been in here ten minutes let's judge his character.
	Mel	ok. ready Henry?
	Henry	ok.
	Mel	You're first
	Joe	You're gonna get killed
	Bob	ha
	Joe	Keep your mouth shut and don't say a damn word. ha ha
	Henry	He's not at all like Joe.
	Mel	No
	Henry	He's more like Mel and I
	?	( )
	Henry	What you refer to as – hippie. ha. He's been in it up to his neck
	Bob	yeah˙
4:00	Henry	A couple of times
	Joe	Ha ha. Taste good?
	Mel	No. I bit off the end of it. I was chewing the end of it.
	Henry	umm.
	Joe	Bitchin
	Henry	Havin a big hassle with your folks
	Bob	yup
	Henry	Right. Daddy wants to keep you down Mommy
	Bob	hmmm?
	Mel	Mommy you can tell what to do
	Joe	(cough) God damn cancer
	Mel	See. I told you, we know everything about this guy already
	?	Sure
	Henry	Do you have any brothers or sisters?
	Bob	No
	Henry	Daddy's sort of sheltered you
	Bob	No not really
	Henry	No?
	Bob	Not really
	Mel	You sorta shelter them?
	Henry	Do you have a car?
	Bob	No
	Joe	(gasp)

4:30	*Mel*	oh oh. One point against you.
	Henry	You had a car?
	Bob	No
	Henry	You want a car
	Bob	oh hell yes, ha.
	Mel	You've stolen a car?
	Henry	Daddy doesn't want you to have one.
	Bob	No he wants me to have one, my old lady doesn't.
	Henry	oh!! Main conflict with mother.
	Bob	yes
	Joe	hehh
	Henry	Mother's too dominating.
	Bob	yes
	Joe	But you've been had already fella. ha ha
	Mel	ok
	Henry	Bring your mother in, we'll work on her. ha ha
	Bob	ok
	pause	
5:00	*Mel*	What are you thinking, old man?
	Therapist	hahh I'm thinking Bob has certainly had it. hahh
	[*Henry*	Whip out your pad
	T	Five minutes and you guys
	[*Henry*	No No write down what we say take the ( )
	Joe	You gotta pardon these guys they're all they're all the social outcasts of the world.
	Henry	This one's chicken shit. He's a bastard, and I'm a Mau Mau.
	Mel	ok. good. Now we're all settled, what are you?
	Bob	oh I'm
	Joe	You a hood?
	Henry	This is an abnormal session. See we're not together without the broad.
5:30	*Bob*	yeah
	Mel	See we gotta have the broad here. Cause she unites us.
	Joe	She unites us – she keeps us on the road. Ha ha. Table's always ready and ha –
	Henry	She sorta keeps us on the road
	Henry	oh well
	Mel	oh well you know that the way things go. That's the way things lie down.
	Henry	He sorta keeps his mouth shut and writes down things whenever you say something important
	[*Mel*	And then if you ask him
	[*Henry*	He's a good guy though
	Mel	to do something then you have to pay him though

	Bob	yeah
	Henry	Eventually you'll become sane.
	Joe	yeah but you –
6:00	*Henry*	Or your mother will which is not what you think.
	Bob	I hope so
	Henry	You're not crazy, it's your mother, hah?
	Mel	But uh it takes about, I've been here four months and it's getting better now. I used to think that I was a bird and would fly.
	Henry	Yea He used to walk out on us, he thought he was above us.
	Mel	Yea. But now I'm now I'm below you.
	Henry	Yeah. I corrected I corrected that quality. I gave him an inferiority complex. ha.
	Mel	And I got him to shave.
	Joe	hehh.
	Henry	Yeah. I'm not grubby or nothin
	Bob	No. hehh
	Joe	hah. Hey this is the academic counselling center. It's called the family, family circle.
6:30	*Henry*	It's not really an academic counselling center; it's sort of a drive in nut house. ha ha.
	Mel	Then you rent a counsellor; $5 an hour and 50¢ a question.
	Mel	ha ha.
	Henry	Don't consider this one– but on the whole you'll enjoy 'em. Ha. In fact it's a good way to spend Saturday morning.
	Joe	hahh.
	Mel	After Friday night.
	Henry	The morning after the night before. Ha ha. After a couple cups of coffee you're alright.
	Bob	yeah
	Joe	A couple dozen cups of coffee.
	Mel	Chew a cigar now and then and
	Henry	I don't smoke (he's been smoking a cigar)
	Mel	He just started last night
7:00	*Joe*	You gotta believe it. You gotta believe it we're the only two in here that smoke other than him.
	Henry	Doesn't Barb smoke?
	Mel	No. she doesn't smoke. She said she used to.
	Henry	She's a good girl. ha ha
	Joe	She smokes cigars. That's about all. ha ha.
	Mel	They smoke. I chew them.
	Joe	He eats it.
	Henry	Well chewing them is half the fun – oral gratification. heh heh

	Mel	Let's see, what else can we tell him?
	Henry	They say that's why bubble gum and all that shit's good uh so popular
	Joe	Why?
7:30	*Henry*	There's a trend to put things in your mouth – like thumbs
	several	(laughter)
	Henry	No really. Why do you think babies suck their thumb and adults chew gum and smoke? Everybody wants to keep something in their mouth.
	Mel	Well. you know –
	Henry	Now I'm not talkin about eating or nothing. And I'm not talking about what you're thinking of either. Hahh.
	several	(laughter)
	Henry	No really I read this in some book
	several	(laughter)
	Mel	oh come on
	Henry	It's really the truth
	Mel	one more thing –
	Henry	Look at him. Look at him sucking at that pipe all goddam morning.
	several	(laughter)
	Mel	He sucks on his dentures too. Now listen, one more thing. There's people watching us now. They got a tape recorder and –
8:00	*Henry*	That is the microphone (pointing). Occasionally there's somebody in there judging us. They're baby headshrinkers. They're learning how to be.
	Joe	Don't worry about 'em. They destroy the tapes afterward.
	Mel	He's not quite one. He won't be one until two months. He's writing a –
	Henry	paper. But today we're not being uh viewed. We're just being taped.
	Mel	No. we're being viewed. There's somebody in there. Cause they lit a cigarette.
	Henry	But he's blind.
	Joe	Hey. Don't worry about it.
	Bob	How how could you see him?
	Mel	Well he can see us but you can't see
	Bob	Can you see through this here?
	Henry	When you turn the lights on. See it's darker in there. I think –
8:30	*Joe*	Wave at him. He's a nice guy.
	Mel	Anything else Henry?
	Henry	And if it gets private we can always shut the curtain.
	Bob	heh great.
	Mel	to do something.

	Mel	Anything else Henry? D'you think we oughta let him in on? or tell him?
	Joe	We're all nuts?
	Henry	Naw. Let him slide for a few weeks.
	Mel	ok
	Henry	Get the hang of things, heh.
	Mel	Then we'll really go after him. Then when we – when we get –
	Henry	We'll let you rest with your problem now
	Mel	We've told you all your problems now you gotta rest with them.
	Joe	Yeah
	Mel	Then we'll tell you how to solve them.
	Henry	You gotta get warmed up
	Joe	(cough)
9:00	*Henry*	And vice versa.[1]

---

[1] On the original transcript, the materials fitted precisely onto six pages. The tape goes on for another hour and 40 minutes, or so. Whether the fragment would have continued on until the bottom of a next page, or have cut off at this neat time-and-topical place, is an open question.

Lecture 3
A collaboratively built sentence; The use of 'We'

I'm going to begin discussing this eight-minute segment from a group therapy session for teenage kids that I gave out last time. When I used this last year as a final exam, I offered as a suggestion for considering it, that I took it to be an initiation ceremony, and as such, among the things in it that are of interest is the fact that it isn't done via a script. I think it may be the case that one of the participants in the group knew beforehand that somebody new was going to come that day, but that's about it. There isn't any basis at all for supposing that this thing was planned by them. And yet (if 'yet' is at all a relevant term; it's relevant vis-à-vis the literature on initiation ceremonies anyway) there are certainly features in it which are proposed to be present in initiation ceremonies. But our task is not going to be so much to see the extent to which that is so, but to try to come to terms with this thing, as best we can.

I'm going to begin consideration of it with what I take to be Segment 2, which runs from the cough which is right after the introduction of the various personnel, until that point which is very close to the 1:30 marker, where Mel says "Oh, ok." So it runs from "cough" to "oh, ok," inclusive. That's going to be the subject-matter for these first considerations. Perhaps we'll eventually move backwards and forwards.

There are, in the conversation itself, a lot of events that are to the altogether naive eye, quite remarkable. That is, without any analysis and simply by inspection you can find some things that you might take to be worth thinking about, without any special consideration of what we've done here at all. Probably the most striking thing right off, would be that part of the third section where there's a series of eleven questions run off in about 45 seconds, by the given members of the group to the new entrant, in which they ask him things about himself, giving in each of the questions what they take to be the answer. And where the questions have some rather extraordinary detail in them, for example, question ten, "Ten, you've been kicked out of school once." The issues of how these guys have that information, and what they do with it, are quite obvious ones. And perhaps we'll eventually get to consider that.

Segment 2 begins with what is, in its way, also a rather remarkable occurrence; and that is, the three boys collaborate to produce a single sentence:

   Joe :   (cough) We were in an automobile discussion,
   Henry :   discussing the psychological motives for

Mel :   drag racing on the streets.

It's not altogether unheard of for two persons to collaborate to produce a single sentence. The normal way that is done, however, is that, say, one person produces an almost complete sentence and finds himself searching for a last word or a last phrase which he can't find, and the other offers it. Another place where one gets something like this is in the following sort of thing: A person makes a request – 'Would you pass the salad." Somebody else, maybe the person who got the request, then appends to the request some word or phrase that they propose properly completes it. . .((voice from the gallery: "Please")) . . ."Please;" which they propose that, lacking that, the request is not complete.

Now those are two sorts of things worth considering in their own right. But they're far off from this thing we're looking at. It's a kind of procedure of such power that if it were used as a literary technique it would just be rather vulgar, I suppose. I know a couple of literary uses, though I can't really pin them down for sure, and if anyone knows of any you could tell me sometime, or collect them yourself.[1] In a musical version of Edgar Lee Master's *Spoon River Anthology* he uses this as a way that the pair of lovers talk.[2] That is, the pair of lovers talk in the following sort of way: Each one produces part of a sentence, which the other then may complete. So you write out a sentence, break it somewhere, and have the other part of the pair continue it.

Now Masters was writing a while ago, and I take it that we would take it that that's an altogether obvious device to show, through this playing with the syntactic features of an utterance, that these people are close to each other. They're a unit. Because a sentence is obviously a prototypical instance of that thing which is done by some unit. Normally, some single person. That then permits it – for those who have the wit to do it – to be a way that some non-apparent unit may be demonstrated to exist.

We get, then, a kind of extraordinary tie between syntactic possibilities and phenomena like social organization. That is, an extremely strong way that these kids go about demonstrating that, for one, there is a group here, is their getting together to put this sentence together, collaboratively.

It's hard to figure how they could do that right off, in anything like as sharp a way as they picked. As it happens, as rare as I take it that this kind of a thing is – and until I saw it I don't think I had seen anything like it before – in the very same segment there's another. Between 1:00 and 1:30 we get the following sequence:

Mel :   Ok   Now you've got that out of your system. Now you're a poor
           little rich kid we've told you that.
Henry : And we also decided you're a chicken shit.

---

[1] Written in at the margin: "Donald Duck. Huie, Louie & Dewey." A student contributed this.
[2] Written in at the margin: "cf. Freud."

In the case of the participle "discussing," which constructs what is being said as a dependent clause and makes, then, the statement before it a clause also, the phenomenon is rather sharper than this one, where "and" is a rather normal way to begin a sentence. But it seems to do exactly the same kind of job, for, now a different group. That is, if the first group (Joe, Henry, Mel) is formed through their production of "We were in an automobile discussion . . . ," etc., and is demonstrated to be present through that production, as an organized entity in this terribly powerful sense of being organized in such a sufficient way that a task properly done by a single person is done by all of them together – and not as a chorus – then, there are clear ways that Mel's "Now your're a poor little rich kid we've told you that," followed by Henry's "And we also decided you're a chicken shit" is very similar. I'll consider this one when we get down that far into the conversation. And if you examine the conversation with the slightest attention, certainly one would take it that at that point in it a subgroup is being formed, consisting of the two people (Mel, Henry) who collaborate on that sentence.

Such mobilizations of syntax are normally assigned to purely literary phenomena – poetry, the novel, the play – as their expectable environments. That they might be explored by laymen doing quite unformalized tasks is something that is, I take it, quite worthy of being investigated – for other things than just this particular way that these syntactic features are being handled.

Now let's see to some extent how that thing is done. Joe's utterance, "We were in an automobile discussion," is something which by itself could be a perfectly decent sentence. And it is, then, in the first instance, what Henry does that makes it the independent clause of a sentence which is now to have a dependent clause. That is, Henry makes his own statement not possibly a sentence by using the participle "discussing," which is just not a way of beginning a sentence.[3]

About the third part (Mel's "drag racing on the streets") there is no question that it collaborates with the second in making of the first, 'the independent clause.' Neither the second or third alone are sentences, and the two together do not make a sentence. Only with the first is it all a sentence. So that particular choice of participle is to be accounted for by reference to some task of social organization, solved by reference to syntactical features. And not by any, quote, purely linguistic considerations. Or even stylistic considerations. The participle, then, becomes an object in the technology of social structures, I suppose. And we get some work that it can do which one isn't going to find much in whatever radical grammar you're going to look at.[4] That would be trivially true for almost every grammar, since they would never make a distinction in the first instance, between speakers. And yet it's obvious that, that this statement is made by three persons makes it quite a different statement than if it was made by one. And if you took it as all made

---

[3] Written into the margin: "Needs to be modified, for it can begin a sentence."
[4] Written into the margin: "And we don't find this in sociology texts either."

by one, the various ways that they might have of doing the kinds of things they can do when they make it together, would be enormously weakened. Suppose, for example, Joe had said the whole thing. And the two of them either said "Yeah," or nothing. The character of what they would be affirming would be possibly obscure.

So it's not only that they present themselves and demonstrate that they are organized, but by collaborating on the sentence they have this extremely powerful way of showing that they do agree as to what it is that the topic was: They all have some part in saying what it was. And I take it that that's a different kind of technique of affirmation than is, A says the topic was X, and B says yes it was. And that would be especially relevant where the question is, what does that topic mean; where, for example, a person who hears it may take it that he is not sure, and perhaps neither of them really agree on it.

In the way that these fellows fit their talk together, which would involve a hearer in seeing that they 'know what's on each other's minds,' he could presumably as well take it that what it is they're talking about, they also know. And that the thing works this way would of course be further evidenced if we had more studied uses of it; that is to say, literary uses, for example, where it is obviously just that point that's being made. That is to say, what better way is there for lovers to show that they are one.[5]

In that regard it's perhaps worth opening up one's notion of what it is that organization might be directed to doing. There is, I take it, a considerable tendency to think of the task of organization as being the solution, by a set of persons, of some job which no single one could, or could efficiently, do. Although that is certainly so to some considerable extent, the fact that there is a job that any person could clearly do by themself, provides a resource for members for permitting them to show each other that whatever it is they're doing together, they're just doing together to do together. That is to say, if one wants to find a way of showing somebody that what you want is to be with them, then the best way to do it is to find some way of dividing a task which is not easily dividable, and which clearly can be done by either one alone. And that, I take it, obviously is done rather frequently, if not with the putting together of sentences, then with all sorts of other things. Where neither party can then readily take it that the other is simply being of help, but is involved in seeing that what they're doing is 'doing whatever you're doing with you.'

Now there's certainly ambiguity in 'divisible' as a term. And what I'm pointing to is not something which is not readily divisible and is also unmanageable by one person, but something which is not readily divisible but which is manageable by any single person. The point can be made by paraphrasing a fantastic aphorism of Kafka's. He loved to play with the problems of social organization, and give them queer formulations. And at one time he's considering Neptune's problems. Neptune is the bureaucrat who runs the oceans, according to Kafka. And he has the following kind of problem: How in the world is he supposed to divide up that kind of work?

---

[5] Written into the margin: "cf. Freud"

You can't, after all, assign somebody an ocean. It's not that sort of non-divisibility that we're talking about.

Now there are, aside from what I've just mentioned, a variety of other things involved in this segment that we're going to have to consider in one way or another.

An extremely sharp formulation is made of the term 'we,' where it remains the subject of the sentence without each person affiliating himself to it. And we might then say about 'we,' that what it refers to is 'those three guys.' That, however, would be a possibly troublesome kind of way of characterizing it. For what we might have to decide, then, is what kind of form of 'those three guys' does it refer to? That is, is it a list in which they happen to be the only people on the list – that is, directly pointed to by 'we'? They talk in a sequence which might permit one to say they are a list of persons, and previously they are introduced as a list; a list of nameables. Now if it is a list, then there are of course a variety of kinds of operations which might be permissable on that. For example, order might not matter at all. If we wanted to write them down we could say 'we:' (Mel, Henry, Joe) or (Joe, Mel, Henry), it doesn't matter. As long as you have them there, that's it. At least for some purposes it would seem intuitively obvious that order is not irrelevant to the use of those names, and if we go back to the first segment, we can see such a one.

When the new entrant comes in, the others are sitting around the room, in chairs. There is the therapist, then Mel, then Joe, and Henry. Bob comes in, and he's introduced. There's a pause in the introduction, right at the beginning: "This is uh Mel." Now we can take it that at that point matters are open as to how they're going to be introduced, i.e., in what sequence. And we can take it that probably only two alternatives are present: Go around to the therapist's left, or around to his right. But you wouldn't start in the middle, i.e., with Joe. Once the therapist has named Mel, presumably anybody who came in and knew that Mel had been introduced, could do the job of introducing. And if it were done in any other sequence, we would take it that something special is being done. For purposes of introduction, then, if the persons are in some way physically arranged with respect to each other, then we would take it that it isn't simply an open matter as to what sequence they ought to be introduced in. There may be some openness to it, but probably, given the first name, there's a proper further sequence to the end.

Now the problem about 'we' that we have to deal with, which is only roughly posed by the issue of orderability, is the following. Is it the case that 'we' is some collection of these guys' names, directly? Or is it some category or a set of categories for which these fellows are incumbents? Where, then, their names are usable to refer to them, but there is some organization, perhaps, of those in that category. Where that organization is what's important. And saying that, then we have to turn to it first. Do we have to build a category here? Or can we turn simply to the list of names as the thing being referred to?

'We' clearly can refer to a category, which has as one of its crucial properties that no intention exists of listing the incumbents, and furthermore they're not

listable. That is, 'we' can refer to an infinite population. For example, 'Americans.' That's an obvious infinite population. People on a bus are an infinite population, insofar as you don't say 'at time T.' 'We' is stable over the use of 'Americans,' and therefore it might be only incidental that these people are listed.

Now, "What's the difference?" may be a question for you. If it were the case that 'we,' in this instance, is properly used as the substitute for a listing of the personnel and could not be used unless a list could be made, and a list were intended, then it's clear that 'we' must get a tremendously more restricted use than it in fact has.

One way we could go about approaching the issue of, is there some category that is being referred to by 'we', is to consider what may be a same use of the term in this segment – where there are quite different uses of it, clearly. That is, there are some uses in the middle which perhaps refer to a group whose incumbents are two persons. But the last use of 'we' in this segment, in the sentence "We got company," looks to me, anyway, like a similar use to this first use. And now we've got an alternative category to the unknown category we're dealing with, which is 'company.' Whoever 'we' are, 'company' is something in alternation to that. And 'company' is a kind of interesting term. First of all, it doesn't discriminate either as to single or plural personnel, and it is clearly a category that is in alternation to some other category. Now it's interesting, for one, that it's a category in alternation to some other category, but there are a variety of uses of 'company' which stand in alternation to a variety of categories. It is, in a way, a general alternation category. That is to say, this could be 'family' and that could be 'company;' this could be a variety of other things and that could still be 'company.'

Lecture 4
Tying Rules

Last time I ended in the middle of a consideration of that first use of 'we,' and I made some issues about the kind of term it might be. I'm not going to continue with that now, because I'd rather hold off on considerations which are somewhat deeper than what I want to be doing, which is just going through some of the readily observable features of this segment. And when we've gone through those, we can deal with such matters as the 'we.'

So let's proceed now by first considering some of the ways beyond what we've so far gotten, that the utterances of this segment are tied together. In doing that we will of course – 'of course' because that's the way the data happens to run – be re-observing things that we've observed earlier in the course. So let's get at some of the ways that the parts are tied together – where that they are tied together is a fact, and would be part of the warrant for saying in the first instance that there's a conversation going on, and perhaps even that what I picked out is an isolatable segment of it, i.e., that we have some way of deciding that this is 'a segment of conversation.'

When I earlier introduced some sequencing rules I said about them that they could operate within a sentence, across sentences, and indeed across utterances. And we have a variety of them so operating here. We can stick initially to those that operate across utterances. They tend heavily to operate across consecutive utterances; that is, between two utterances, one of which follows the other.

Now right off is what looks to be an instance of this Verb Followed by Pro-verb Rule:

> *Joe* : I still say though that if you take, if you take uh a big fancy car out on the road and you're hotroddin' around you're you're bound to get, you're bound to get caught and you're bound to get shafted. We– look
>
> *Mel* : Now did you do it right.

In this instance the rule would deal with "are hotroddin'," Mel's "do" being the Pro-verb replacing, standing for, substituting for, referring back to Joe's "are hotroddin'."

There's at least one, and surely more, Noun Followed by Pro-noun:

> *Mel* : Not many people get picked up in a Pontiac station wagon.
>
> *Joe* : Now I agree it looks like a daddy's– It looks like a damn mommy's car.

That is, "Pontiac station wagon" in one utterance, "it" in the next utterance.

The character of these as rules in these cases will have to be examined, and I'll try to say something about that in a while.

One that recurs several times, and that's rather more complicated, we could start out by examining in the sequence:

Henry :   And we also decided you're a chicken shit.
Joe :   I decided that years ago.

The term I'm interested in there is Joe's "that." There are several others like it. In Henry's first remark of the sequence he says "That's the problem with society," and "that" presumably refers back to the long if–then clause of Joe's, "if you take a big fancy car out on the road. . ." etc., etc. And there's one of the same sort, internal to a particular utterance, Mel's "Now did you do it right. That's the challenge."

I stated initially that 'that' is a more complicated problem. That is so because, for one, 'that' can have a variety of other uses, and does, in the very conversation we have here. For example, Joe's "I still say though that if you take. . ." right at the beginning of the segment, is a rather different thing. What that involves is that we have to have some way of locating the class of 'that,' apart from the sheer occurrence of 'that,' which is possibly relevant to this rule. Where, let's say for now that the rule works something like: Predicate ← 'That'.

The question of how we go about locating those 'that's which are relevant to this rule, will involve us in considering the character of all of these rules when they're operating across utterances. And let's do that, briefly, anyway. The occurrence of these rules, being not located within a single utterance, poses for us a problem: What form are these rules supposed to have, insofar as they are somehow regulating or guiding the Members' actions; and what kind of procedures for analysis do they pose?

At least a rough version of the problem might be as follows: The fact that there are these rules, and that they have a clear locus within a single sentence, say, operates to provide a maxim which is what we can call a Second Speaker's Maxim, though 'second speaker' has to be given what may be seen as a special formulation. Somebody who wants to make themselves a second speaker to some utterance can have as a maxim for him that if he wants to tie his utterance to that of a preceding speaker's, he can formulate some part of his utterance as a second part of one of these rules, if he can use some second part which can be tied to some then-made 'first part' of a then-made 'first speaker's' utterance. That is to say, somebody who wants to make themselves a second speaker, can make somebody a first speaker. It can be anywhere in the conversation. He makes some part of what some speaker did, a 'first part' for one of these rules. He doesn't start out, we take it, with a set of marked objects: First Parts for these rules. But by his speech he makes some part of what some speaker did, a 'first part' for one of the rules.

So the analysis starts out with the locations of the second parts of these rules. And it's in that sense that someone formulates himself as a 'second speaker,' i.e., the maxim doesn't govern first speaker's actions. What we've got then, is something like this: There are these rules which may have an unspecified environment of use, which could be a single sentence, some sequence of sentences by a single utterer, or the utterances of several persons. If they're going to be used by some group of speakers, then it's the business of somebody who is formulating himself as a second speaker to invoke them and provide for the relevance of a first item by using something that is clearly a second item. When someone does such a thing we get, quite obviously, a sense in which he ties his utterance to that of some preceding speaker.

Let me indicate that it's perfectly possible to set oneself up as a first speaker by the use of other sorts of rules. For example, if you ask a question, then the fact of a question sets one's position as 'first speaker' to which the rule Q → A, Question Followed by Answer, is locatable by the fact that there's an observable 'first occurrence.' And I think it is the case that there are a variety of ways that persons can formulate themselves as first speakers for even some of these Second Speaker Rules, though that's a rather more subtle problem and we'll deal with it as we come to handle data in which it's present.

And I want to introduce an unspecified caveat to the Second Speaker's Maxim: It is the case that persons can in one way or another move to prevent the use of their utterance as something to which another can tie an utterance, and they can move to encourage it. So while the maxim we set up can operate independently of what the formulated 'first speaker' does, there are things a speaker can do to effect what treatment their utterance may get. That there are, is something that is for at least a certain kind of conversation, quite important.

But for utterances handled by the Second Speaker Rules, we want to start out with the second item and find a way of finding the first. And we have to have some clear way of deciding that we have a second item. Some of them may be quite clear as, at least, possible second items. The various pro-terms might be quite clear, but we take it that 'that' is not clear. How then do we find out whether we have a 'that' which ought to be seen as a possible second item, so as to start the search for a first, so as to see, then, whether that person has used the rules to tie his piece of talk to a preceding piece of talk? What we're considering then, is the sequence that the analysis has to go through, and what is has to include.

Apparently what it has to include is an analysis of the syntax of the sentence. And that's important. It's in the first instance, I think, the syntax of the sentence that tells you whether you have such a 'that' as is a likely second item. The differences of the 'that's are the different syntactic functions that they serve. Those that we're dealing with here as second items are probably easier seen as the objects of the sentences, and those that are not are things like, particularly, conjunctions. Now those sentences in which the relevant 'that's occur, have them in a very clear position. "That's the problem with society." And what's invoked by "that" is the predicate of the preceding

utterance; that is, the problem of society is that if you go out and hotrod, etc., certain things will happen to you.

And for "I decided that years ago," 'I decided years ago' is an adverbial phrase, I suppose; 'that,' the object, replaced with 'I'm a chicken shit.' And I take it that that at least holds for the material that we have. I also take it that you oughtn't to get terribly frightened, since you could easily enough see what the object of the sentence is, as compared to 'that' being used as a conjunction in, for example, "I still say though that if you take . . ."

But the important thing is that to locate those second items we have to go through some crude or not syntactic considerations, and it's not the word's occurrence that does that for us. If we then locate a 'that' that is an object of a sentence, we have the basis for then proceeding to consider whether there is, and what is, that thing to which it's tied. (In the materials we have, they tend to be whole predicates, I guess, of preceding utterances.) and if not whole predicates, then pretty near whole predicates.) Now that's something that we haven't previously considered. That is, we have not previously found situations where syntactical analysis was required before we could do the analysis we needed to do.

There are a variety of other things which are, in the case of this conversation, perfectly simple to see. Such things as the simple use in some second utterance of the same subject or the same subject plus verb or the same verb, as is used in a previous utterance. There are a bunch of such things; for example, the use of 'you' in Joe's "if you take a big fancy car out on the road and you're hotroddin' around you're bound to get caught," followed by Mel's "You wanna try and do it right so you do not get caught." That 'you' is an exceptionally important phenomenon. It's a definite pronoun, and it has no special reference at all. It certainly doesn't mean you, the listener. I'll consider that sort of 'you' when I get finished dealing with these rather surface aspects of the way the conversation is tied.

Verb phrases recur in first and second utterances; there's "picked up" . . ."picked up" in some sequence, 'tear down". . ."tear down " in another,[1] and others.

Now there are some uses of the rules which start out by having the whole

---

[1] The reference here is probably to the following:

Joe : and the guy will pick the guy up in the dirty grubby tee shirt before I before he'll pick me up. Just– just for–
Mel : Not many people get picked up in a Pontiac station wagon.

and

Henry : Hey don't tear him down
Joe : I've been torn down for–
Mel : Ok
Henry : We got company

rule introduced in a single utterance, and then, by virtue of the fact that the rules are repetitively operatable – as we said earlier, you could have N ← P ← P, indefinitely – what we get is: N ← P in one utterance, and then the continuation in the second. So we have, "Joe, face it you're a poor little rich kid," then several lines down there's an elaborate way of relocating that subject, and a continuation of the use of 'you' as the subject thereafter, quite clearly tying that to the first use.

Henry: Joe, face it, You're a poor little rich kid.
            .
            .

Mel: Okay   Now you've got that out of your system. Now you're a
          poor little rich kid we've told you that.
Henry: And we also decided you're a chicken shit.
          .

Mel: Now let's see what else can we decide about you?

I'll consider this one, also, in more detail, because it's not a perfectly simple use.

There's a rather interesting one involved in the following sequence. We get "Bonneville" ← "it," i.e., N ← P, and then "Pontiac station wagon" ← "it." They're talking about the same car, and it's at least plausible that the reference of 'Pontiac station wagon' is to 'it' in the preceding utterance, as its antecedent.

Joe: In that Bonneville of mine? I could take it out with me . . . and the
       guy will pick the guy up in the dirty grubby tee shirt before I before
       he'll pick me up. Just– just for–
Mel: Not many people get picked up in a Pontiac station wagon.
Joe: Now I agree it looks like a daddy's– It looks like a damn
       mommy's car.

I said it's interesting because there's a tremendous economy in this conversation, and in many such conversations, involving the use of nouns – they're just not much used. And when you get one used, it's doing some work. The compactness of these conversations is handled in part via the tremendous use of these pro-terms, which just make up the bulk of talk. That can be seen at first glance by virtue of the fact that there's only one use of a personal name in the conversation, and that use has a major significance, it marks a big change in topic.

In the case of "Bonneville". . ."it," "Pontiac station wagon". . ."it," the renaming of the car is clearly a recharacterization of the car. I say 'clearly,' in the sense that if you knew it was the same car, then you'd take it that something different is being pointed out about it. The person who originally used the term 'Bonneville' acknowledges that something different has been done (Joe, with his "Now I agree it looks like a . . . damn mommy's car"),

and some people who have seen the conversation and didn't know it was the same car, took it that in fact an attack was being made, without regard to whether 'Bonneville' and 'Pontiac station wagon' were different names of the same object. The fact that that's done by change in name would suggest that whatever generic critique one could make of Russell's notion that names are disguised descriptions, nonetheless in this sort of situation that's the way the names are being used. So that 'Pontiac station wagon' is a transformation of the name of the object being initially referred to, which transforms the character of that object from something which, let's say roughly at this point, could be a thing which you could approximate hotrodding in, to something which you couldn't possibly approximate hotrodding in. Why you couldn't possibly, is something we'll consider eventually.

Let me just note about the range of sequencing rules, that they can be used just as sheer indicators that there's a conversation going on. And one way you can characterize people who can't converse is that, so far as you can tell, you could perfectly well disorder the conversation without having any effect on it. That is, you could juxtapose any of the parts. Given the way these things operate, if we have these rules tying pieces of conversation to other pieces, you can't disorder them. You can't put an utterance that contains the second for some particular first, ahead of it. It matters what sequence they come out in. And people make it their business to make it matter.

There are also some much more interesting, perhaps less obvious, and in any case less overt and 'technical' – in the sense of having to do with the names of these words – ways in which this conversation is tied together. But to get at them I'll have to do a whole big analysis and I want to deal with things that are right on the face of the conversation before we move on, so you can see first how obviously locked together it is. Therefore, I'm going to move to some other surface features of the conversation before dealing with the more elaborate ways it's tied together. In doing that, I'll be doing something which I ought to have done previously, and which may give some sop to people who are interested in personality.[2] And that is, there are some really quite striking ways that, even in this one page, these three guys speak differently. And these are quite obvious and observable things, though some of their technical features may not be obvious. For example, this fellow Joe recurrently uses a pattern like "you're you're bound to get you're bound to get caught." There are three or four such uses. It's not an unheard-of thing. And it's important to see that it's not an unheard-of thing; that it is something that has been observed, and observed as characteristic of something. This is not to say that if it is characteristic of something, then he is one of them. But it is characteristic of the speech of very young children. It's something called 'buildups.' For young children, it may have as its basis the fact that they have a very limited grasp of grammar, and they literally assemble a sentence by putting its parts together, piece by piece. If you look at a book I've mentioned before, *Language in the Crib* by Ruth Weir, she has a discussion of these

---

[2] The title of the course was 'Culture and Personality.'

things (pages 81–82), and a bunch of examples. The kid there is, I think, something around two. But any of you who have heard young children talk, will have heard that sort of thing. It's obviously not simply a stutter. And it's extremely characteristic of this fellow, Joe.

Another thing that is sort of striking occurs twice in Mel's speech, and I don't think anywhere else. It's not a unique usage at all, and it's perfectly well examinable as to what it can do. And that is, he uses the syntax of questions without making – for utterance-rule purposes – questions. That is, he builds a syntactical question without intending that at the end of it he would stop talking and somebody would answer. He does that in quite obvious ways by using the reversal pattern of questions: "Now did you do it right," for example, and "Now let's see what else can we decide about you." That is, ". . . can we . . . ," ". . . did you . . ." are such kinds of things. And I'll consider those, also.

The third fellow, Henry, has what looks like an exceptionally idiomatized way of talking. Three of his whole utterances are single pre-constructed sentences, akin to proverbs in a way. That is, they are sentences that he didn't have to construct for this occasion, that can by used by whomsoever, that come on just as that – a sentence. Things like, "That's the problem with society," "face the music," and "we got company."

Lecture 5
Tying rules; Insult sequences

I've been examining how the parts of this segment of conversation are tied together, dealing first with some very small 'pair-ties.' We'll move on to much more elaborate ones as we go along, and then get into what this conversation is about, and how it works with respect to that kind of matter. The kinds of rules I've been offering are by and large not at all constrained by what the conversation happens to be dealing with. Eventually we'll see that there are no untied utterances in the segment. And by that I mean, no utterance for which there is not at least a single tie. We'll find that for some there are far more than a single tie. I haven't worked out a measuring system to compare conversations in this regard, but I take it that that might be doable in any event.

Let me go over some of the rules I've already given. We have, for example, some purely-internal-to-a-sentence rules, like the one for making an independent clause out of what might have been a sentence, and for making your own utterance a dependent clause in that sentence, and for making your own utterance a dependent clause in that sentence. It runs something to the effect of: If some given utterance is ended by a noun, then participialize that noun and use it to begin your own utterance. And of course, besides participializing that noun you have to be otherwise syntactically consistent with the preceding utterance. Just consider: "We were having dinner". . ."dining on roast beef." You can make a whole bunch of them in just that way, although that's not the only way you make dependent clauses.

The second rule concerns prepositional phrases. They consist of a preposition plus a noun phrase. If an utterance ends with a preposition, then if you begin the next with a noun phrase that could be the noun phrase for that preposition, you tie your utterance to it.

A third rule concerns the use of conjunctions. Now the conjunction is rather more complicated because the syntactical consistency is much more important. If an utterance ends with what might be a sentence, if you begin the next with a conjunction and otherwise make it syntactically consistent, then again you can tie the second to the first.

Then there are a variety of rules which, while they could operate within a sentence or within a single utterance composed of several sentences, they can also operate across utterances. Given that for these that I'm going to list, we start out with the second item for the rule and not the first, it might be convenient not to write them as, e.g., N ← P (N followed by P), but as P → N, so that we know that we're starting with P. So there's that one for pronouns and nouns, there's the same sort for pro-verbs and verbs, there's the

one for 'that' (with a special constraint on syntax) and predicates; now there are some more.

Some of the others, once we mention them, will permit us to see a rather clear difference between those things which we identify in the first instance from what turns out to be the second object, and those we identify by noticing the first object. For example, we can look at a question–answer sequence, which is as clear a version as you want of starting out with the first part. In this conversation you get things like: "What school did you go to?" I went to Palisades." and "You've been kicked out of school once." "Yeah." Now for those, it's by virtue of the fact that the first item provides that the next is going to be a second, that those seconds are clearly seconds. They are not otherwise so identifiable. They're not even identifiable as answers to questions. But there's no doubt, I take it, for anybody, that things like "Yeah" in that sequence, are second items. But what we have in these other kinds of rules, is that the first items are not identifiable as 'first items.' It's by virtue of the fact that the second is clearly 'a second to something' that we go back and find a first, as compared to, say, the question–answer sequence where we identify the first. That means, for one, that you get a kind of distribution of compactness in the question–answer sequences. Given the fact of the question providing the relevant sense of the thing that ought to follow it, nothing much has to go into the answer. And a zillion questions could be answered by 'yes' or 'no.'

Now we can find some instances of this question–answer sort of rule in this piece of conversation. There is at least one command and then return-to-command – it could be either acceptance or rejection of the command, but it would be clearly seen as one or the other. For example, 'Joe, face it . . . ," "Yes . . ." (I'm not saying the 'yes' is an acceptance. I'll analyze it eventually. It's a much more careful thing than an acceptance in that case.) It is by virtue of the command being seen as the first item, providing for a relevant second, that the seconds have their character, though some answers are obviously answers – not many.

There's one which you can play conservative or non-conservative on, as to how you write the rule, but let's say: Incomplete Utterance followed by Interrupter Term. I say you can play this conservative because you might not take it that the utterance was clearly incomplete. And you might start out with the fact that it looks like you've got an interrupter term, and work backwards: interrupter term → incomplete utterance.

I take it that that holds in its strong version – that is, incomplete utterance first – for the sequence:

Mel: Now let's see what else can we decide about you?
Henry: Hey don't tear him down

'Hey' is clearly an interrupter term. You might not take it that it's obvious that "Now let's see what else can we decide about you" is an incomplete utterance. To get some feel for that, reconsider the earlier statement that is

syntactically alike to it, "Now did you do it right." And I want to cross out the question mark at the end of "Now let's see what else can we decide about you?" because in my last listening to that piece of conversation I find that I now think that there is no intonation at the end that leads one to feel it's a question, though of course it has that reversal construction of a question, i.e., not "let's see what else we can decide . . ." but "let's see what else can we decide . . ."

There is a class of tying verbs that are used. There are a lot of verbs that may tie, but there are some verbs which, when used, are just tying verbs. Like 'agree.' When somebody says "I agree," they're tying that statement to some other statement of somebody else's. So you could write it as some utterance ← tying verb, but it would probably be done as tying verb → some utterance.

Now there are some things which can occur within a single utterance or could even occur in single sentences, which also can occur across utterances. When they occur across utterances they are clearly serving to tie utterances together. And those are what we could call lister terms. The most obvious lister terms are, of course, things like the ordinal numbers: First, second, third, as we get in the next segment of this conversation, in the series starting with "Well first of all you must be crazy . . ." But there are some used in this second segment to do that kind of work, that are not the ordinal numbers. A series can be explicitly started with a first, $L_1 \rightarrow L_2$. Or you can have a first occurrence of a lister that is making itself follow something else, where the other has not been specifically introduced as the first of a list. In this segment Mel says "Now you're a poor little rich kid, we've told you that." You might say that 'now' is a lister term. It's not clearly one, it has plenty of other uses, and you'd have to make a good argument for it. But it's followed by "And we also decided . . ." which turns it into a 'first' where it could have been just a single.

A lot of other rules can be constructed, but with these you can certainly get some idea that these people were in some way or other talking to each other, and making the fact that they were talking to each other a big part of their business.

Now, what I'm going to be doing is taking small parts of a thing and building out from them, because small parts can be identified and worked on without regard to the larger thing they're part of. And they can work in a variety of larger parts than the one they happen to be working in. I don't do that just as a matter of simplicity, but as I mentioned earlier in the course, the image I have is of this machinery, where you would have some standardized gadget that you can stick in here and there and that can work in a variety of different machines. And you go through the warehouse picking them up to build some given thing you want to build. So these smaller components are first to be identified because they are components perhaps for lots of other tasks than the one they're used in. But then they'll be fitted together into some actual single larger component in this case.

Okay, let's look at this one for a while:

> *Henry*:   Joe, face it, You're a poor little rich kid.
> *Joe*:   Yes Mommy.
> *Henry*:   Face the music

We could start off simply enough by saying that it is a recurring part of, let's say at least, teenager's conversations, that an insult is properly followed by another, or a return to it.

In fact, that little thing itself is the basic component of some very standardized teenagers' games. They are alternation games, they have names, and one of the names is in fact used later on in the conversation. There is a considerable literature which pretty much first emerged into literature in a paper by John Dollard in 1957 called 'On playing the dozens,' which is a Negro kids' game, and it's an insult game. The kids engage sequentially in insulting each other. They tend to do it before some audience, where the audience, by its reaction, decides that the game is over. In that form it's been well written-up in a variety of papers. Dollard's paper is in a book by Roger Abraham on that sort of phenomenon, called *Down in the Jungle* (1964).

The game was apparently not much thought to be one that white high school kids play, but they do. And one of the names in that environment is 'tearing down,' which is what the action eventually gets called in this sequence. It is not, however, to be seen as getting its analysis by some simple historical expansion – which is one way that people have considered it – that is, that it passed from Negro kids to white kids at some time. Because some of its features, like this 'Mommy' bit, are fabulously old.

The 'Mommy' return is extremely classic in such kinds of things. I'll give you a quotation. This guy Eric Partridge, who writes all these things up, has a book called *The Shaggy Dog Story*, and in it he reports what he calls an ancient Greek story.

> A pert youth meeting an old woman driving a herd, called "Good morning mother of asses." "Good morning, my son," she returned.

Apparently that's one of the classic ways that you handle an insult, i.e., if it's an insult for which the most elegant return would be to make my status a consequence of yours. And kinship obviously is the most powerful way of doing that, like "You're an ass." "Thanks Dad." Those kind of things are obviously extremely powerful and by no means new, by no means to be accounted for by the fact that in Detroit the racial barriers are broken down so that Negro kids and white kids are closer to each other – except incidentally.

There are several reasons I'm going through the fact of this game. One is that by treating the first event as possibly the first event in such a game, by doing a second, that's a way of giving a special characterization to the first insult as something that is not serious and is not going to be heard as serious. It also sets up a challenge, which is, Okay you started, I came back, go ahead

if you're willing to. And Henry withdraws. That is, the move that would accept the sequence as a game and continue it, would be for him, since he has a slot, to come back with another insult. But he closes it off with "Face the music." It's quite apparent that what he's done is to withdraw, in that when it rapidly turns out that he has an ally in that thing, it starts up again, as you can easily enough see.

Henry :   Joe, face it. You're a poor little rich kid.
Joe :   Yes Mommy.
Henry :   Face the music
Mel :   Ok   Now you've got that out of your system. Now you're
            a poor little rich kid we've told you that.
Henry :   And we also decided you're a chicken shit.

While we're on this sequence, we might as well note that one of the things we earlier pointed out is also present here. I proposed that if it were the case that we had the form of pronoun–noun relationship where the pronoun actually precedes the noun and is not the second that's discovered first, but is first, then something special is going on. And the 'it' in "Joe, face it" is such a one. One pretty clear thing it's doing is, it keeps that utterance open to then flip out the item that completes the N–P pair.

There's a whole bunch of ways that statements that might be closed by virtue of the fact that they're sentences, are kept open in this first segment. I pointed to some of them already, though I haven't worked out how they work. For example, those special kinds of questions that this fellow Mel uses. Another is that even if the game itself doesn't go on, and one is restricting oneself to an insult-and-retort sequence as one's expectation, then apparently one of the things about the insult–retort sequence (and this is another tradition which is perhaps independent of or pre-existent to this game) is that there's a big crucial thing on having the last word, for some reason or another. And by first producing "Face it" and saving the formula "Face the music," then, whatever the retort is, Henry has the last word, because the formula is tied to his first usage, and he can then fit it in and close the sequence off. So, where you have a formula that you're invoking by splitting its usage, that may be a significant thing to do, and in this case it clearly is. And there's plenty of literature about having the last word. There's a classic thing to look at, an absolutely fabulous book I mentioned before, *The Lore and Language of School Children* by Peter and Iona Opie (Oxford University Press).

Now I want to deal with another little one, one which what I have to say is somewhat beyond my level of believability – which I guess is much more extravagant than other people's – but nonetheless it's possible. And that's the sequence:

Henry :   And we also decided you're a chicken shit.
Joe :   I decided that years ago. Hell with you

The question is, what kind of a return is "I decided that years ago, hell with you." Clearly "hell with you" is of some relevance. It's an indication of courage, or something. Now it's perfectly clear that "I decided that years ago" is not an agreement. It's instead, a rejection. Why should it be a rejection? It looks like a perfectly good agreement, nonetheless it's perfectly clearly not an agreement but a rejection. There is an obvious enough formulation, except it's as I say, beyond my belief that they could be that ingenious, and that is that what he's doing is to set up an antinomy. And he's using the fact that he's setting up an antinomy to undercut the statement. An antinomy is a statement that, if it's true, it's false, and if it's false, it's true. The classical one is "I'm a liar. Everything I say is false." Here, if it takes courage to recognize that you're a coward, then to have recognized that you're a coward took courage, and therefore you couldn't be a coward.

Given such a possibility, I would then try to see, is it the case that people in their ordinary affairs do use antinomies. And I haven't really looked very hard so far, but I found at least one, and it's a classic one, also. It comes from this book, *Style in Language*, edited by Thomas Sebeok, a paper called 'Oral styles of American folk narrators' by this American folklorist, Dorsen, on page 41. He's reporting some story he was told:

> The next supposedly true happening, where Art is asked to tell a lie and says he has no time because so-and-so has just had an accident and he must go to a doctor – which is a lie – is an international folk tale attached to various American yarnspinners

Lecture 6
'You'

I've been talking about this bunch of tying rules. There are a lot more, even of the sort that we've been laying out, apart from any that are more intricate than those, but that's enough for now. The question is, so there they are, why bother talking about them? What is it that they do? To some extent it's terribly simple to see. It's one sort of task for the hearer of some statement to determine what it is that the person who produces some noun is referring to, if he's referring to anything: What's an 'automobile discussion'? What's a 'car'? etc.; it must mean this or that. That's one sort of task. When the tying rules are used, another sort of task is imposed on the hearer: To decide what it is that the tied term – for example, 'it' – refers to, requires finding somewhere in the conversation that the term it ties to occurs.

So in the use of these, there's then a required piece of work for the hearer, which involves collaboration in making out the conversation. Understanding the term implicates the hearer in the conversation – and of course provides that in the very use of such an object the speaker has implicated himself in the course of the conversation. The use of these, then, is not to be seen as simply a way of, for example, avoiding redundancy or making variety or whatever else, but it provides an order of work – and is produced by an order of work – which is at least to some extent different than the work involved in using a name, etc. So that, at least in the first instance, is what the use of these tying rules involves. And that's then, the way in which they make for the sense that the various participants have, that a conversation is taking place; where the participants are implicated, and they are involved in working at all of its parts, as a set of parts.

Now the work that's involved can be sort of minor in that someone may claim, or may in fact not be able to see what it is that some pro-term refers to, i.e., what term it refers to. But it can also be extremely important. It can be the case that some usages provide that if their hearer wants to play dumb, then he's going to have an extremely touchy task to do that. That is, the routine use of these things may operate to provide a great deal of information for the one who uses them; for example, that on some occasion the other does in fact understand what one is talking about, by virtue of the fact that he can continue to put in terms where, quote, nothing explicit has been said – or not much explicit has been said. Eventually I'll give you some instances of usages which are strategically very powerful in the sense of forcing someone to acknowledge that they do in fact understand something, where the fact that they do understand it has tremendous consequences. But for now, I just wanted to raise it. The initial remarks about tying rules would be enough to

163

give them some strong warrant. The things I will mention eventually are just elaborate technical developments on them, and they're of some interest but they're not that enormously core.

Let's go back, then, to dealing with bits and pieces. In the first pair of utterances after the introductory sentence of the second segment, we have 'you' used as basically the subject, i.e., ". . . if you take a big fancy car out on the road and you're hotrodding around you're bound to get caught and you're bound to get shafted." "Now did you do it right. That's the challenge. You want to try and do it right so you do not get caught." I want to make some remarks about 'you.'

First let me list some references to the extremely large literature on terms like 'you;' terms such as I, you, he, this, here, now, it, and the like. They've been subject to a lot of study by philosophers and logicians, and if one is interested in conversation, one might well look at that literature to see what's been done on the phenomenon of conversation. Some of the literature is at least historically interesting. There's chapter 7 of Russell's book, *Inquiry into the Meaning of Truth*, and he calls them 'egocentric particulars.' Then there's Nelson Goodman's book, *The Structure of Appearance*, chapter 11. He calls them 'indicator terms.' Then there's Reichenbach's book called *Elements of Symbolic Logic*. He has a long chapter on the analysis of conversational language, which isn't what it says it is; not at all. It's important to see that it's not – and to see that nonetheless it's pretty unique in saying that it is, anyway. That's chapter 7, and he calls them 'reflexive terms.' Then there's Quine, *Word and Object*, section 21. He also calls them 'indicator terms.' Then there's a lot of articles in the philosophical journals. I'm not going to cite them all. Some of them use the names I've given you, but one that's relevant in that it uses its own name is a paper by Bar Hillel in *Mind*, 63 (1954), titled 'On indexical expression.' That's what he calls it. Then there's an old monograph by a linguist named Cullenson, called 'Indicators,' *Language Monographs*, 17 (1937).

The core thing about these terms, and why they're of interest to the logicians, is that they have an extraordinary transiency of reference. So the issue is, if you're dealing with 'the truth or falsity of propositions,' then how are you to interpret a proposition which has the term 'now' in it, or 'he' in it, or 'you' in it, etc. Much of the work has been directed to trying to find a way of rewriting statements or sentences that have those terms in them, so as to provide for the fact that they could be true or false. I won't be considering such issues.

But there's one immediate consequence for my previous discussion. One of the things you ought to see is that if any such terms occur in immediately juxtaposed utterances, that would not be necessarily at all an instance of something that you would want to call a tying-rule case. My proposal that 'If the same subject appears in two consecutive utterances then those utterances are tied,' would not at all obviously be the case if 'you,' and then 'you' appeared. For one, if there are two different speakers, they're not at all referring in any obvious way to the same person. In fact, if you're going to use

these in focusing on the tying operation, what you would want is that whichever term appears in the first utterance, the alternative term appears in the second. You could have an instance of tying if you had 'you' → 'I,' or 'I' → 'you,' where 'you' → 'you' is not at all an obvious such case. So these terms pose a problem for working on the tying operation, but it may be worked out. In any event, the usual 'you' → 'you' problem is not present in the example we'll be considering.

In this case, ". . . if you're hotrodding you're bound to get caught . . . ," "You want to try and do it right so you do not get caught," we have what is a very recurrent use of 'you,' and it's what, if Reichenbach were to talk about it, he would immediately translate as 'one,' 'someone,' or something like that. It is not referring to the person being addressed. It's what we could call, to start off with, an 'indefinite use.' And one of the things we want to ask is, how does it come about that 'you' is used to make that indefinite statement? Why don't they say 'one'? Are they equal?

I think there are more than a couple of things involved, and I'll try to mention most of them that I know of. Let me first discriminate a couple of possible senses of the term 'ambiguity.' One characteristic way it would be used is in an either–or relationship – either you mean this or you mean that, it's not clear which, and they don't have anything much to do with each other. Another usage of the term – and that usage is most considered when you're dealing with poetic language – is this-and-that. For poetic language, one question is, how do you go about building richness into a compact form. One way is to get words which mean this and that, whatever this and that may mean. And the usage of 'you' that we'll be considering is, I think, a case of the latter. 'You' is a very good term for attempting to build ambiguity of the this-and-that sort.

I think the analysis ought to run something like this: What we have to do is to try to construct what a procedure might be for determining what it is that's being referred to when somebody says 'you.' Is there a procedure? If there is one, what does it look like? And what are the consequences of there being one?

Now 'you' in English is, at least in the first instance, systematically ambiguous, in that it does not discriminate between singular and plural usage. And in the ambiguity of 'you,' one has the this-and-that format; that is to say, it is 'you' (you alone) or 'you' (you and others). When a person hears 'you,' they then go through a procedure of deciding what it refers to. And that procedure has a first step, where if the first step seems fully adequate, that ends the procedure, but if it's not, then one goes on. The first step in the procedure is the consideration of the applicability of the singular use, and if it's the case that one comes up with, well maybe that, but certainly not only that, then one moves to the second step and engages in finding, now, some plurality for which the 'you' would be correct. And that plurality could be, for example as I mentioned earlier, some category which, once it's found it would turn out that the singular is a member of. It's also the case that one of the nice things about the non-differentiation and the plural character of 'you' is that

there is no limitation essentially on the size of the population it can be referring to.

The singular 'you' is used as simply a way of dealing with the persons present and being spoken to in an interaction. Plural 'you' is no longer controlled by that fact. It's not at all necessarily the case that it's only referring to the multiplicity of persons present and being spoken to. Indeed, as I mentioned earlier, 'you,' even in its singular case, is regularly a way of referring to that member of 'they' who happens to be present. "You Negroes."

That openness of the plural 'you' means that 'you' can in fact be a way of talking about 'everybody' – and indeed, incidentally, of 'me.' But there's at least a tactical difference between saying 'we' with that intention and 'you' with that intention. The difference is, 'we' has some plural reference, automatically. And it does not have, automatically, a plural reference which includes the person being spoken to. This is in English. In some other languages it's the case that 'we' can only be properly used if it refers to [me and the person I'm talking to]. So you do not say 'we' when you're referring to [me and my wife, and not you]. In English, we do. And 'we' can then – intentionally by the person speaking, or by the decision of the person being spoken to – exclude the person being spoken to. In contrast, if you use 'you,' it at least includes the one you're speaking to, and on their option or on your intention, insofar as those coincide, it can refer to anybody else, or to some category which includes everybody else.

And those differences are extremely carefully focused on by speakers. I have a lot of very subtle usages which turn on those differences; for example, a woman is asked "Why do you want to kill yourself?" and she says "Well, you just want to see if anybody cares." Now that use of 'you' in this case surely refers to her, but refers to her as a member of 'anybody,' and thereby provides that it is only incidentally her reason, but it's anybody's reason, and thereby is not attackable as peculiar. It is offered as proverbially correct.

Those kinds of uses are recurrent, and apparently quite powerful. I have one I just pulled out of the paper the other day, involving an interview between vice-president Humphrey and a Japanese newspaperman, on some relationship between Japan and the United States over control of atomic weapons, I think it was. And Humphrey is asked about America's policy, and whether Japan would have more say. And, although he's talking about what 'we' will do, he formulates his remarks in terms of 'you,' e.g., "You want to give other people a chance," etc. This involves now putting the Japanese who read it in the position of assessing his problem as though it were anyone's problem in such a situation, and it's nothing peculiar to America's position that involves them in being hesitant; anybody in such a situation would be hesitant.

Now, one of the core things about this use of 'you' is that if in the first instance you find that the singular 'you' is inappropriate, you do not move to a sense of it which excludes yourself, but to a sense of it which is much larger but at least includes yourself. It may also, by interpretation, include the

person who has spoken – as you see it, or as they see it, or obviously. But nonetheless, you are also included, which 'one' does not do. And 'we' does not do, and any of the other terms do not do – 'he' doesn't, 'they' doesn't, etc. But 'you' uniquely does. So it isn't the case that 'you' and 'one' are equivalent.[1] And it does seem to be the case that the procedures for determining what it is that 'you' refers to – if the procedure is something like I make it out – is crucial to the special use the 'you' gets and that no other pronoun term gets. That is, 'you' is the term which gets used in specifying a proverb, or a proverbial type of frame.

Returning to this sequence, there are other things involved in the use of 'you.' One of them is another kind of ambiguity. We get this statement of Joe's, "if you go hotrodding you're bound to get caught." If it's some generic type of argument of an if–then sort (though there's no explicit 'then'), it could be delivered as, "if anyone goes hotrodding . . . ," "if a kid goes hotrodding . . . ," etc. What the 'you' does is, beside making it an argument, it borrows the form of a warning. That's the way warnings get delivered. "If you do the following, then this will happen to you." And the relationship, for kids anyway, of those generic if–then types with warnings, is probably something quite ambiguous. They first learn the warning version. They then have to learn to separate the pure argument type. And for some matters, I take it, it must be quite important that one never makes a complete break, and that there are ways of making the assertion not merely an argument, but also a warning, or a piece of advice. And clearly one way that would be done is to use the form of the warning, which involves the use of 'you' in that phrase. More generally, if you count the number of uses of 'you' in these proverbs, and their power – which is tremendous – you have a lot of material.

Now I want to consider the sequence:

Mel: Ok   Now you've got that out of your system. Now you're a poor little rich kid we've told you that.
Henry: And we also decided you're a chicken shit.

When we started out the discussion of this segment, I pointed out right at the beginning that we have here, again, as we have in the first sentence of the segment, a collaborative production of a sentence. In this case there are several ways that the parts are tied together. It's not simply the 'and,' but the subject used in the first utterance is retained in the second, i.e., the 'we' – and that's extremely crucial. And the relation is further established by the 'also,' which provides that it's building on what has just been said.

Simply by virtue of the set of properties we got, we might feel quite confident in saying that what we're getting at this point is the forming-up of

---

[1] Several people in the class speak up with difficulties about the references of the terms, including a disagreement with Sacks' proposals about what 'one' does and doesn't do in contrast to 'you.' Sacks' response is that " 'One' doesn't include the self or the other necessarily. [It] doesn't include anybody necessarily."

a second group within the group, which second group consists of as members
the two participants to this sentence. Let's look at it a little more – not that
we're going to find out that it's wrong, but just to see how it works out. Until
that point, we really haven't had such a demonstration of the two-against-one
characteristics of this conversation. When Joe got finished with his first long
speech, the two others spoke essentially at the same time and took different
positions.

> *Joe* :   you're bound to get caught and you're bound to get shafted.
>   We– look
> *Mel* :   Now did you do it right. That's the challenge That's the
>   challenge   You wanna try
> *Henry* :   That's the problem with society. Hahhh
> *Mel* :   and do it right so you do not get caught.
> *Henry* :   That's the

And when we got to that point where Henry starts to attack Joe, he did it a
bit on his own, and closed it off – as I've suggested anyway.

> *Henry* :   Joe, face it. You're a poor little rich kid.
> *Joe* :   Yes Mommy.
> *Henry* :   Face the music

Now Mel comes to the rescue, in a way. He ties his own statement back to
the preceding attack on Joe, with the 'now,' and the reassertion of Henry's
statement.

> *Henry* :   Face the music.
> *Mel* :   Ok   Now you've got that out of your system. Now you're a
>   poor little rich kid we've told you that.

He reasserts the statement as 'we:' "we've told you that." That 'we' can have
a strong and a weak usage. It could be strong if it were the case that what he's
saying is, 'Henry told you that, and he is our representative.' That is, the
single person who spoke is a member of 'we.' That would be a chancy kind
of thing to do, in two ways: One, Joe could say, "No, 'we' didn't tell me that,
he told me that." And two, Henry could say, "No, 'we' didn't tell him that,
I told him that." So he's taking kind of a chance there, to go out on his own
to establish what would be protective for the two of those fellows if it gets
accepted. Given the possible chancyness of it, he does in fact establish it was
weakly correct by virtue of the following: 'We' can equal, besides 'he, as a
representative of us,' also, 'he plus I.' And he has in fact said it just now, and
he saves the "we told you that" until he said it, so it's weakly true at least,
that 'Henry said it and I said it,' and that is 'we.'

Lecture 7
'Hotrodders' as a Revolutionary Category

At the end of last time I was talking about that statement of Mel's and most particularly the use of 'we' in it:

  Mel: Ok   Now you've got that out of your system. Now you're a poor
         little rich kid we've told you that.

In it, at least as I see it, there's two possibilities laid out. One is an offer made by Mel to Henry that the two of us are a group, of which what perhaps either of us say is said representatively for both. Alternatively, there's weaker use of 'we' which makes his statement at least safely true, i.e., where 'we' means in its weak sense, 'you said it before and I said it now', and thereby he needn't be subject to any total rebuff. Now Henry takes him up on the strong use, and accepts the formulation in its strong sense, and in doing so he moves to a whole range of important doings.

   First of all, with his "And we also decided you're a chicken shit," he tacks on something that had initially been proposed by him prior to this eight-minute segment, as something that 'we' did, also. Since he was representative just a moment ago, he was also representative a while ago. In doing that, he also is involved in more sharply posing the fact that there has been a change in topic, as well as a change in the formation of the given group. The change in topic is that Joe is now clearly the topic. And Henry does that by indicating that a list has been started about Joe, with 'also' being this 'lister term.' And in doing so, he provides, then, for Mel what it is that he could do, which is of course to continue with the list. And that is an extremely safe way to proceed, given that in continuing he'll be doing so as a member of this new subgroup within the group, which is in the first instance a strong one, since it contains at least a majority. There has been a first amalgamation within the group, with the three of them collaborating to produce a single sentence. Now there's two against one. The two have joined, and the group has a distinct form. It's not just a bunch of kids sitting around with no particular structure to the group.

   Once we have this majority situation, we get to what could be an extremely crucial point in it, which Henry proceeds to use in as strong a way as he likes, and that is, if there's a majority in the group, then the majority can be representative of the group. If there's a representative of the majority, then the representative of the majority can be the representative of the whole group,

and he who leads the majority is thereby the most powerful man in the group, in a special way: He's not now just the most powerful man among the three but nevertheless subject to attack by either of the other two, but he's the most powerful man within the majority, protected by the other in the majority, who would at least be concerned that their group last, and who might fight out the issue of who's going to be the leader in that group, but be concerned to keep it that at least one of them will be the leader.

What Henry rapidly does is, having got into a position where they're clearly putting down Joe, he takes his first opportunity to now put down Mel.

Mel :   Now you're a poor little rich kid we've told you that.
Henry :   And we also decided you're a chicken shit.
Joe :   I decided that years ago. Hell with you
Mel :   Now let's see what else can we decide about you
Henry :   Hey don't tear him down
Joe :   I've been torn down for–
Mel :   ok
Henry :   We got company
Mel :   oh ok.

Henry takes the opportunity to put down Mel by giving that command, "Hey don't tear him down . . . We got company." It is furthermore much stronger than just putting down Mel, because it also is, in the first instance, at least an attack on the new entrant, Bob, and also on a lot more, which I'll go into. I lead up to this because what I want to do is focus on this term 'company,' having just sketched the shifts that take place very rapidly right here, with Henry accepting the new formation and then moving to take that over, and thereby to take over the group itself.

The category 'company' is, as I briefly mentioned earlier, rather a special one. And we ought ultimately to consider it in combination and contrast with a category like 'hotrodders.' Before dealing with the basic way it's a special kind of category, I ought perhaps to mention some of its import, which can be seen without regard to what I'll be saying. And that is, for them to formulate him as 'company' – and we've seen how you can say 'them' in a serious sense – is obviously for them to propose that whatever has been done by whatever institution that might tell this fellow Bob, or his family, that he has troubles, and whatever way this clinic that they go to might go about selecting personnel, and whatever position the therapist might be supposed to have in controlling the group, nevertheless he does not decide, and all those others do not decide, that Bob is a member. That's for these kids to decide. For them, he's company. And they seem to be able to do that. There is, then, some kind of independence in their determination of who's a member, and if they're controlling the conversation, then that determination on their part is indeed important.

Now, holding that, let's consider what kind of a category this category 'company' is. I suppose about the most grandiose way I could choose – which

is the way I choose – to bring the point home, is to quote something which has become, in its place, extremely famous and extremely fundamental. Though when you first hear it, unless you know about it, it's not very likely that you'll think there's anything very special going on. It's from chapter 14 of Genesis. It goes like this:

A fugitive brought the news to Abraham the Hebrew, who was camping at the terebinths of Mamre the Amorite, kinsman of Eshkel and Aner, these being confederates of Abraham.

There's a phrase there, that is, in the history of biblical criticism, one of the most fundamental of all in the bible. That is, 'Abraham the Hebrew.' There's an immense literature on it, and here's in part what its importance is: It is among the very few places in the bible that an Israelite is referred to by the term 'the Hebrew.' That term, 'the Hebrew' is only used by an Israelite for self-identification to a foreigner, or by foreigners about Israelites. And what that's been taken to mean is, that this section of Genesis was a segment taken from some document which had not been written by Jews. And the importance of that is, that it's the fundamental piece of information which provides for the possible historicity of Abraham. That is, if there was a document which was not a part of Israel's traditions, not written by them, in which he occurred as a figure, then that's as strong evidence as they've gotten that it was in fact some person, and not just the name of a tribe, or something else. (The term 'Hebrew,' itself, has other significances; it's a very generic term in the ancient Near East, referring to a class of persons.)

The thing is that here's a category which has become crucial in biblical criticism because what's seen about it is that a member would not use it to refer to himself, except under very special circumstances. It's a category that we might say, roughly, is the possession of some group other than its users. In terms of current large-scale focus, the Muslims have a similar attitude toward the category 'Negro.' And what they want to do, in part, is to legislate the status of 'Negro' into having the same characteristic as 'Hebrew,' so that if you knew somebody said "so-and-so the Negro," you could say about that somebody, "He's not one" – unless it was a conversation in which the user was identifying himself to an outsider.

'Company' is obviously the same kind of category. It's used to refer to some outsider, or it's used by an outsider to refer to himself when he's talking to some member and characterizing himself as an outsider to them. I said it was a category in alternation to some other category. It is also a category that is used, by and large, by those who are using the alternating category to categorize themselves.

We can examine lots of categories to see who is it that owns them. And we can see that that kind of question can be a really important one. We'll see that when we consider what kind of difference there is between a category like 'hotrodders' and one like 'company,' and between, let's say, a category like 'hotrodders' and one like 'teenagers.' We'll also then see some

of the things that people are trying to do when, like the Muslims, they attempt to propose that Negroes shouldn't use 'Negro' as a category, and when, like teenagers, they construct and attempt to use a category like 'hotrodders.'

For them to say that this fellow Bob is 'company' will increasingly be seen as an attack on, not simply the therapist, but in some ways, the ways that the institutions that get all of these guys here are constructed. Because in the first instance this category is one that the kids administer. It's a generic category, available to whoever can bring it off, and that's different than the category 'hotrodders' which is laying around in this conversation. Let's consider that a little bit. And in doing so, we'll be moving more explicitly to a consideration of some of the things involved in the phenomenon of 'an automobile discussion;' what kind of topic that is, and what it is that can be accomplished within it.

Now if we can take it that to some extent 'hotrodders' is a category that is by and large employed by kids to characterize themselves, and whose use, to some considerable extent, they enforce, and whose properties they enforce, and obviously it's, at least to some extent, a category that rebellious persons can use, then at least one of the initial questions we might ask is: Why should it be the case that at least some people who go about doing kinds of rebellion, do it by formulating themselves as some particular type? That is, why do they set up a type? Why don't they try to make themselves observable as 'individuals,' so to speak? That might be an alternative to setting up a type. (Of course 'hotrodder' is by no means the only teenager type that they set up and enforce.)

That kind of a question – Why do they set up a type? – is not necessarily a good question. What we want to see, in formulating the problem they have, is what is it that they seem to see as the things they have to come to terms with. And that seems to be in the first instance, that at least for certain activities which are rather important to them – like driving – it isn't the case that there's any big problem about what category will be used to classify them by whomsoever happens to see them driving around. Now, that is, in principle, a problem, and I've occasionally focused on more-or-less unique solutions to it.[1] And for kids in cars, they apparently take it that there is – and there's probably good reason for that – a rather unique solution. And that is, a kid in a car is 'a kid in a car.' If a kid is driving, he's seen as a teenager driving, and he's seen via the category 'teenager,' compared to the variety of things that he could be categorized as. His problem, then, initially, is that he is in fact going to be typed; where, for one, the category 'teenager' is a category owned by adults. Which is to say that what it is that is known about the incumbents of that category is something that adults take it they know, and know without respect to kids' proposing that it's so, or agreeing that it's so.

The problem has some other aspects, which are perhaps more obviously deep. And that is, it's clear that one of the crucial things to the teenager is the

---

[1] See Spring 1966, lecture 7, pp. 325–7.

problem of independence, and one of the core facts about it is that in its given form, adults set up and decide and enforce what it is that it takes for a kid to be independent. And that poses for each kid a task that he has to solve on his own, in confronting an institutionalized setup that's going to handle him one by one. Now the question is, is there some way of setting up solutions to the problem of independence, which kids administrate? So that they decide when you're independent? Where adults will, in the course of time, simply be forced to accept those characterizations, as they'll be forced to use whatever categories the kids invent to characterize themselves? I'll consider the gains of that kind of thing, to some extent. But it clearly would make a considerable shift in the independence problem. For one, it would not be an issue where each kid faces the adult world on his own. To set up a type, then, like Hotrodder, or Surfer, or Beatnik, if it can be successfully done, is then to get for the collection of persons a very large gain. That is, if the 'they' group, whoever it be – call them 'adults' – come to use the type as well, but use it under the extremely important constraint that what it takes to be a member, and what it is that's known about members, is something that the members enforce.

Now a first thing that one wants to be able to do, is to so construct appearances, and to so let out information, that members can take it that when they're seen by whomsoever, they will be seen as a member of the category they want to be seen as a member of. That is, they're not going to be seen as 'teenagers in cars;' they're going to be seen as 'hotrodders' – or 'beatnicks,' or 'surfers,' or whatever else. That, of course, poses a series of tasks. What is it that it takes to get a category like 'hotrodders' across?

There are some things that turn out to be quite obvious solutions to that problem. Everybody drives cars, and 'teenagers driving cars' involves nothing more than looking into the car, whatever car it is, and seeing that there's a teenager there. Now the thing about hotrodders' cars is that you don't have to look into the car. The car itself is so constructed that at any distance you might choose, you see 'a hotrod.' And of course what's crucial to that, in the first instance, is that other people do not play around with the products they get. They take the car and they drive it.

The modification characteristics have some rather usual features for such kinds of categories, and that is, anybody can tell it's a hotrod, but it is members who can tell if it's a good one or a bad one, what rank it has, etc. And in that way of course, there's strong protection against outsiders coming to see how it is that whatever ranking goes on, goes on – except by, in fact, becoming members of a sort. That thereby gives much freer play to the members' deciding and enforcing what counts as a really good hotrod. Now there are, of course, rather classical reversal procedures, i.e., what looks like the worst car to anybody else, is the best car. And those kinds of things are very frequent in any such kind of operation. Presumably it's just focussing on that thing alone, that 'turn the world upside down' in that sense, that makes almost all of, let's say, the Beatnick characteristics. Hotrodders do not stand in that sort of simple opposition; it's not a pure Hegelian operation.

Now if it's the case that what goes into deciding the rank of a hotrod is something that kids decide, then one can at least begin to see how it is that they're able to set up, and what are the kinds of things they would use to set up, machinery for social control over candidate members. That is, one is a member by recognition of others who are members. And thereby, to successfully get membership, you have to do what it is that they provide is the way to become a member. You don't ask your parents for permission, and then treat that as your entry card. Nor is it something you can do without a very considerable commitment. It is not something that you can do on an occasion, in any given apparatus. That is, you can't take your parents' car out for a weekend and go hotrodding. There are a lot of things you can do with it, but that's not one of them. And adults are, by and large, excluded from the use of these things.

That has some rather important kinds of aspects to it. It permits one of the crucial things the kids are concerned to get, and that is, an initial equalization, such that the determination of one's status as a member is not decided by as many relevances given by the socio-economic structure as can be excluded. It really is not any advantage to have, let's say, the fastest stock car to start out with – and in any case, it would not be 'hotrodding' to drive it. And it's very important, of course, that kids do not allow it to be 'hotrodding', and that the way to not allow it is simply not to recognize the moves of someone who, for example, pulls up to you in such a car. That kind of thing is very regularly done for all sorts of other things. Years ago, when sports car drivers used to wave at each other, there were all kinds of rules about what kind of car is a sports car; like a Volkswagon would not be waved at. Volkswagons could go down the road waving at everybody, and get no response. Now what has to be seen is that the response is not anything that is enforced in some way, like if you wave at a Volkswagon somebody comes up to you afterwards, or anything like that. The whole group has to be defended, each one by himself. And in that way, Joe's hypothetical little tale of the other fellow in a Pontiac station wagon is a kind of mutual delusion – if there is such another fellow; that is, they may be able to go through it together, but there is no proper member who would accept either of them. What Joe is proposing, I'll consider eventually because for them it's an extremely important kind of claim he's trying to lay out.

The character, then, of an attempt to set up a category like this is – let's say within Western tradition – a classical attempt at how it is one goes about doing rebellion, at least the first feature of which is that one sets up a category you administer yourself, which others come to use, and come to use in just the unique fashion that they used whatever category they used on you before. Where, initially they used another category on you, uniquely. They didn't say, "He's middle class," and "he's this and that," and "he's such and such;" they said "He's Negro." And the same holds for the teenager. Now of course, that leaves those who don't join, to be so called.

Lecture 8
Invitations; Inexhaustable topics;
Category-bound activities

Given that we have gotten into a position where some aspects of how this group is organized, and how that organization is demonstrated, how they use it, etc., have been considered, we can return to the first part of this segment and dig some more out of it, which we're now in a position to consider, and which can lead us further, also.

> *Joe* :   We were in an automobile discussion
> *Henry* :   discussing the psychological motives for
> *Mel* :   drag racing on the streets.

In our previous discussion of this segment we examined its collaborative aspects. There's much more there than that, and I'll deal with some of those things now.

   We said earlier that that first line could have been a sentence if it was just left as such. And that in not leaving it, Henry moved to use the structure of the sentence to give some indication that these people were organized. That's grossly true, but there are other things about it. For one, if we consider the first sentence as a sentence, then what we want to ask right off is, what is being done by it? Among the things that could be done by it, one obvious thing is the following. Someone has just come in to this group, they've exchanged introductions, now there's this first line. And it's a very familiar first line, and what it is, is, a possible *invitation*. A bunch of people are sitting around and talking, somebody comes in, and they tell him what they're talking about; where they can formulate that in such a way as to provide that it's something that he could be talking about. It's a topic for such as we, without any special classification of who 'you' and 'we' are, just by virtue of the fact that we're all teenagers. And with regard to a consideration of the personnel, you'll find in the rest of the conversation that there are several other places where Joe makes a move like that. For example, after they've worked Bob over, Joe introduces a question that is an invitation: "What school did you go to?," and there may be others like that.

   What I take it they do is shut that invitation off by proposing, in part, that we're talking about that thing which you know about, as any teenager would – but we're not necessarily talking about it in a way that you're informed on. But then there's the addition to it, which is again kind of mundane and ordinary. You can make up sentences like this. Here's one – it's not exactly

in point, though I think it's pretty close. Suppose there's a bunch of girls –
and we don't need to specify the situation – and somebody comes in. One of
them says "We were in a discussion about sex." Then we get "discussing the
physiological side effects of," "using the pill," as a third. The first and third
are something that somebody might well figure that they could, just knowing
that, come into. The second may, however, be something which says, this is
something special and unless you have the special information that you don't
necessarily have, wait before you jump in. It's the modification of the topic
that undercuts the status of the preceding part as 'an invitation.'

Given the kinds of remarks we so far made – and more I will make – as
to the fact that the group is organized, we can get some pretty good idea
about, on the one hand, an invitation should be made right off, and on the
other, why it should be cut off. If the group is organized in a two-to-one setup
(or even one-one-one, as long as it's not three-to-zero), then it would be quite
crucial to the members who this new candidate joins up with, and it could,
of course, be quite crucial to him who he joins up with. And if he simply
jumps into the conversation – where it's how the conversation goes that
provides those affiliations – then some of the kinds of resources that would
permit the sort of decision some of them want him to make, would not be
available.

He doesn't yet know that whatever he says is going to be treated as
something which constitutes an affiliation to one or another side. And if it's
the case that even before this actual segment had got going they knew what
the structure was, and it was two-to-one against Joe, then Joe's best chance is
to get this guy in, sight unseen. He might go with Joe. If so, things are
perhaps equal, and if he doesn't, maybe there's nothing much lost, in that
once the group structure becomes available it's probably not unlikely that, if
he makes his decision on that basis, he's going to go to the two others. And
that's not unlikely, I'd say, not on just the sheer fact that any given person,
if there were a two-to-one situation, would go with the two, but one of the
obvious things about him is that he's scared. He's scared, and that's why he's
here in part, and also, he's scared now. And under that circumstance it's likely
that he'll pick the safest way out; which he does eventually do. That is, the
first remark which can readily enough be seen as taking a position on his own,
is between 3:00 and 3:30, when Joe does one of his not infrequent coughs.
Bob comes on with "Sounds like an old man." That's about as dramatic a
remark as he can make in this. So in the collaborative sentence, then, it's not
the case that it really wouldn't matter who it is that did any of the parts. It
does matter, and the part that each of them chooses to use is not terribly
puzzling.

There are some things about this segment that are worthy of at least further
thought. But let me first make a remark about the segment that follows. The
most extraordinarily interesting thing about it is the way in which the
questions are informative. They say to him, "You must be crazy or you
wouldn't be here." It's a terribly important beginning because it says 'We are
that.' Every question is a piece of information about the character of them;

what it takes to be somebody who's here – at least formulated in terms of what an outsider might say about them.

And it's very important that this question–answer series comes out right. If it doesn't come out right, it's not simply, as an obvious consequence, that he doesn't belong there, but it may well equally be that they don't. Because if he's there, however it was decided, he could belong there. And if he's not crazy, then, maybe this is not a place for such, and if it's true about them, then they don't belong; where there's a notion that the people here ought to have problems they have in common. (I'm not giving any normative formulation to 'problems.' They're called 'problems,' and they would say they are called 'problems' without necessarily buying into that on their own part.) But if it's the case that they go through this procedure of asking a set of questions, and they're right, then they get a very gloomy finding, and that is that the society is right, because these are a list of complaints that are made about them. If, in fact, they locate whomsoever happens to come in here, then there's some sense to the fact that they know what they're doing in putting people in such a place. So the procedure is an extremely important one, however it may come out.

Let's go back to this first segment. They're in an 'automobile discussion.' Now here's a fellow coming into this therapy situation, very likely his first. It could be supposed that he has no idea what it is they would do in there. If they wanted to put him on, they could name any topic they pleased, and he probably would have to figure that that's what they might be doing. When 'automobile discussion' comes out, it could be a very nice thing to hear. "Oh, they talk about whatever it is kids talk about anywhere, and they're not going to be talking about things that are really godawful, or for which I just don't have any information so that I could partake." Except it's much worse than that.

We get the modification which says hold on for a while, see what we're talking about and how we do it. And then we get a sample. And the sample can be seen partly as a kind of ostensive definition of what 'discussing the psychological motives for drag racing' means, and how a topic that you can name in any scene that kids happen to be talking in, gets handled in this scene. In which, we could say grossly, that what might appear to be as safe a topic as you could pick, turns out to be altogether unsafe. And whatever position you take is nonetheless usable to find out what's bugging you. And I suppose as strong a demonstration as needed to show that once you're here there's no place to hide, is to pick as mundane a topic as you could name, and then use that to carry on the intimacies of examination that they do.

When I use the term 'safe' for 'automobile discussion,' I'm not simply saying that. That's how they would quite consciously formulate the matter. At one point in another session they're for some reason or another exchanging fantasies about something they'd like to have. It's about maybe Bob's second session there, and he says he'd like to have a "'64 Triumph Bonneville," and he gets a lecture from Henry as to the fact that that's not the sort of thing to pick; that you don't have to pick anything that sounds as ordinary as that, and if you think that by picking something that sounds safe you get away with

anything, you won't. (Which is not to say that as far as any of them might well understand it, fantasy is about such things.)

I just want to extend the matter a little further, and simply suggest a kind of problem about which I really don't have very much to say, but which is, I think, examinable. Consider things like the topic 'automobile.' One of the things that an outsider, an adult, somebody who is not American, expectably says is, well that could be a topic, I suppose, but it would probably be readily exhaustable; how much is there to say about it? And you could imagine that they could construct such a notion of cars as a topic by considering, for example, that there are a finite set of parts to cars as facts, and that, as you might exhaust the parts if you were assembling it or taking it apart, then you could exhaust the topic. That is to say, you could have an image of eating into a topic as you discussed it.

Now there are lots of topics for any sets of persons, but within cultures there are topics that are intrinsically rich, in the sense that whatever it is that members of that culture tend to talk about – that is, whatever themes they talk about – they can talk about via that thing. For example, an automobile. If one sat down to make a list of what things members of this society can talk about when they're talking about something, then one might find that for kids, automobiles are like that. For example, 'independence.' You could make a list of themes like that, and then see whether or not a conversation is had, where that's the theme that gets focussed about automobiles. If this is so, then you have a rather decent way of saying that there is to some extent an independent culture operating. And that the automobile has now become a focus for kids in the way that whatever else is a focus for the adult culture – if 'adult culture' is a thing to talk about.

Of course it might not be the case that some other culture has a single focus – if cars are a 'single focus.' What I'm trying to say is that one of the things one has to do in examining this phenomenon of automobiles as a topic, is to formulate the character of that object within the set of things which can be discussed, for whatever you're going to formulate it that people are doing. And then of course it would be quite irrelevant to see that adults can't or don't or won't say such things about cars. Cars are now an object similar to parrots for a society in which a parrot is a god. And you wouldn't say, "Well, what can you say about a parrot?" or "What kind of interest could people have in the difference between this parrot and that parrot, or this history of parrots, or whatever else?" You would just not know what they're talking about.

You get, then, a way of seeing the kind of split that would take place when an object is made into a sacred object – and a quite mundane object can be made into a sacred object. Where, for others, it's a purely secular thing: You take it as you get it, and you drive it. And whatever happens to it, so what? You can always get another. And also, of course, you get a way of understanding that persons who deal with this as perhaps sacred have feelings about the miserable way anybody else deals with it. But I don't really know that automobiles are a first-order object. It could be, because most of the

conversations I listened to, I found so terribly boring that it's only recently that I've gotten up enough strength to sit and listen to them again, when they go on for six hours at a shot, talking about carburators.

There's a classic story about Malinowsky going into the field, wanting to find out about geneology. He would talk to the natives about geneology, and he found out that each native would talk for an hour before giving him any geneology, in just bragging about them, and he'd have to go through a whole big thing. Then at one point he remarks that he really became an anthropologist when he could realize that geneologies were irrelevant, and it was the talk, the bragging, etc., which was crucial. And you have to learn to see that happening. I used to sit and listen through these automobile discussions for the points when they would overtly talk about their troubles, and I just don't think that was at all right. It may be its partial distance from somebody like myself that makes this a really good means for examining what a topic like that is, and what you would be talking about when you say it's inexhaustably rich.

Now I want to move to considering the argument that Joe develops, because one of the things we come to see, then, is what kind of category is that category 'poor little rich kid' which is thrown at him when he develops his position. But I can't do that in the time we have left today, so what I'm going to do is something that I could have either taken the whole course to do, or I'll have to do in ten minutes; it's either that complicated or that simple. So I might as well do it this way.

One of the clear problems that I can propose from this conversation is, we could ask: How does it happen that discussions which become arguments end up in name-calling? That's a very standard observation, that it happens. It happens here. Now, how does it happen? There are several things involved in the formulation. We're assuming that the discussion becomes an argument, and we're not asking how does the discussion become an argument. We're saying that once it becomes an argument it can end up in name-calling, and that ends it.

The way we go about handling it involves some very general kinds of observations which only become really interesting when we work them in detail – which we won't get to do.

One of the ways that a problematic occurrence is resolved, is by assigning to the doer of it, some category about which it can be said that the activity done, is 'bound' to that category, i.e., if you knew in the first place that he was a such-and-such, it wouldn't be any problem as to why he did the thing he did. 'They' do such things. Now that fact has consequences in all directions. One of them is, for example, if a problematic occurrence has happened, and one knows a category that's bound to it, i.e., where that category would be said to be the person to do the thing, then you can construct a search procedure for finding who, in fact, did it: Look to the set of people who are so categorized. You could also, apparently, determine that any person who is proposed to have done it, did it or didn't. If he isn't a member of that category, then he wouldn't have done it. And that has all sorts of uses, and

there can be lots of shifts in it. So, for example, the basic character of the argument about Oswald's murder of Kennedy turns on the issue of some people saying, "Of course if he's a Communist he would have done it," and others saying, "The last person who could have done it would be such a one and therefore he couldn't have done it." To which, as I mentioned earlier, his mother had the best solution of all, when she said that he's a human so he could have done it – which is to say that it's not something that is to be found problematic in the way everybody's been posing it.

The fact that some activities are bound to some categories is used, then, in a tremendous variety of ways, and if somebody knows an activity has been done, and there is a category to which it is bound, they can damn well propose that it's been done by such a one who is a member of that category.

What's important, in part, is that it's not the case that deviant activities are especially problematic, but there are categories of persons who do deviant activities and you've got a solution to a deviant activity if you've got a member of a category which is known to do this. I'm not going to deal with the problem of exceptions, although it's dealable with and there are some very nice things about it; I'm just not in a position right now to lay it out. It is the case, though, that exceptions just don't matter. That's easiest to see by seeing that the first Negro and the first ten Negroes you know, can be seen by you to be exceptions to what you know about Negroes. It's not the case that exceptions involve any change in what you know about the category's members. For all the categories that have such kinds of characteristics as that there are a bunch of activities bound to them, exceptions don't matter. It's built in that there are exceptions, and they just don't affect what you know. You know that category does the following, and you know that there are exceptions, and they do not involve you in modifying what you know. I talk about that as: All these categories and the things that are known about them are 'protected against induction.'

The question is, what makes a problematic activity? And an utterance, of course, can be a problematic activity. One of the simplest ways that an utterance can be a problematic activity is, if a set of them has been made by a set of persons and they're not consistent. That is, there's a position 1, a position 2, etc. Now if, let's say, you have two positions that are inconsistent to each other, then it may be the case that you can make one position stand by simply removing the other; like providing it's problematic and explaining it. The other then stands as the only one left.

Now then, one of the ways that one goes about making a problematic position accounted for is, for instance, to assign some category to its sayer. The category is, of course, important, because there can be some categories that are, for example, the categories of persons who are entitled to say such a thing. So that if you say that some scientific assertion is made by a scientist, that would not explain it away, but will provide that it's correct. But for a great many, if you assign a certain sort of category to it, then you can provide that the thing itself can be explained away. And that simple operation has been the

basis for one quite sophisticated sociology. Mannheim proposes that any sociological assertion can be given that formulation. That is, there are a set of categories in the social structure, all of which are competing in that social structure: Upper class, lower class, bourgoisie, worker, whatever you want. Take any sociologist's assertion, and say he says it from one or another of those categories, i.e., assign a sociologist to a category, and you've made his statement subjective.

Lecture 9
Character appears on cue; Good grounds for an action

I'm going to start considering:[1]

> *Joe*: In that Bonneville of mine. I could take that thing out and if I've got a tie and a sweater on and I look clean? ninety nine percent of the time a guy could pull up to me in the same car, same color, same year the whole bit, roll up his pipes and he's in a dirty grubby tee shirt, and the guy'll pick the guy up in the dirty grubby tee shirt before I – he'll pick me up.

This is an extraordinarily complicated statement and we'll attack it over a while, I suppose. Let me just begin by noticing a relatively minor thing. When we get this thing beginning with "In that Bonneville of mine" we have what is a relatively rare, but standarized occasion, and that is that we can say right off that 'Bonneville' is going to be the N of some N → P sequence. It looks for sure that that thing is not going to be dropped, and that we'll then get 'it' or something like 'it'. In our discovery of the rule, I said normally we do not start with the N, we start with the P. But in this sort of case, we can pretty well be sure that we're going to have the reverse rule apply. That, of course, involves the fact that we get this kind of prepositional phrase which would follow , e.g., "I could go out . . . in that Bonneville of mine."

Now, generally throughout this statement we see what you might imagine to be a kind of queer way that the whole thing gets assembled, i.e., clause by clause. There's no sentence in it anywhere – though one might consider from "ninety nine percent of the time . . ." on, to be an adequate sentence – but otherwise you get a buildup (I'm not using that in the same sense I used 'buildup' as a technical term previously) in which, at the end of any given clause it's nonetheless the case that we still haven't got a sentence, and we clearly still haven't got the end of an utterance. To what extent he uses clauses (and there are much more elaborate things he does) to preserve the fact that you can't stop him at any point and have heard what he's going to say, that may be one of the things he's engaged in doing here.

(If you're interested, I can mark it for the way he said it: "In that Bonneville of mine." There's a pause. "I could take that thing out" pause

---

[1] The fragment is transcribed from the lecture and is not exactly the same as the version in the handout.

"and if I got a tie and sweater on and I took clean" pause "ninety nine percent of the time a guy could pull up to me in the same car" pause "same color same year the whole bit" pause "roll up his pipes" pause "and he's in a dirty grubby T-shirt" pause. And then the rest of it runs out to the end. Then he starts up again, but gets cut off.)

One of the things one has to examine about that statement is, how is it that it's nonetheless a quite understandable utterance, i.e., despite its grammatical oddness and despite (if you want to use the word 'despite') some other features it has. For example, the phrase "ninety nine percent of the time" occurs in juxtaposition with "a guy could . . . etc.," except I don't take it we hear it as modifying "a guy could . . ." If you were to put it in sequence, it would be: "ninety nine percent of the time . . . the guy'll pick the guy up," and we nonetheless take that clause and put it where it belongs, when we come to understand it. So there is, then, a considerable freedom in the positioning of the parts of this statement, where that freedom apparently doesn't undercut seeing what it is he's saying.

It's also an enormously condensed statement. And that's one of the things I want to begin to focus on. Let's take as a given, for the moment, the fact that in "the guy'll pick the guy up," the first reference doesn't refer back to the prior "a guy could pull up to me . . . ," though that's a perfectly expectable thing, but that we see perfectly clearly that it doesn't, but that it's a new fellow, and that it's a cop.

Now, if you remember back to the beginning of the course when I considered "The baby cried. The mommy picked it up," one of the things I was remarking there was that when a character who has some proper grounds for occurring and some proper thing to do, has its cue, then there's no need to account for how they happened to have come on the scene. "The baby cried;" you don't have to get a characterization of where the mommy was, that she was anywhere around; the mommy does her job.[2] You can notice again here that the cop is not introduced, as, for example, is this other guy who is driving – he pulls up, gets described, then we have this bit. What occurs is good grounds for the cop to do what he ought to do; he's on the scene and he does it. So he's introduced via the action he does, where the grounds for that action are laid out, though how he happens to be there need not be indicated.

And the question of what character doing what action that kind of thing can hold for, is quite non-trivial. To provide for this introduction of the cop (and, for example, that introduction of the mommy) being quite unproblematic, we would have to work out analyses which would involve building the characteristics of a class of actor – in this case, 'cop' – as a staff deputed to do a set of jobs, and describing how they go about doing those jobs – for example, by just driving the highways – and then considering the information about such a class of actors that any member would have, such that it would

[2] This particular consideration was not captured in Sacks' notes for lectures 1 and 2. For a similar consideration, see Spring 1966, lecture 2, p. 254.

in no case be problematic that on a single occasion of the cue occurring, the character occurs. (This is not to say that the sheer fact that there's a norm that says speeders ought to be arrested is sufficient to provide that the fact that he's speeding brings the cop on the scene.) For organized crime it would be quite different. A bank robber would be much puzzled how come when he arrived, the cops were there waiting for him, and he would ask, "How did you know?"

One can presumably consider this sort of phenomenon and perhaps get an idea of what the sense was for, let's say the Greeks, who introduced in the tragedy, the appearance of a god at some point. We might come to see it, not as what we give it the sense of, i.e., as absolutely unwarranted or unexplicable, or just happening, but as something that was somehow institutionally provided for. We would want, of course, also to see, then, what sorts of proper occurrences need an account of how a character who is doing what's expected or proper, comes to be there. We could perhaps dig out the different classes by just examining things like this statement of Joe's, where it's absolutely unproblematic that he doesn't introduce the cop as sitting behind a billboard, or whatever else. The cop is introduced via his action.

And in this case at hand, it's a rather more powerful kind of thing than even that. In "The baby cried. The mommy picked it up," we had the specification of what was in fact good grounds for the mommy to do her action; "the baby cried." In this case, that, too, is just left out. It is not the case that rolling up his pipes is what's good grounds for the cop to arrive. It's that rolling up his pipes is the first move in a sequence which the occurrence of that technical term provides as going to happen. The driver pulls up, signals the other, they have a kind of drag race, and the cop catches them in the middle of it. That part is dropped out altogether here; filled in by the hearer.

Now it's very nice to have the hearer fill it in because one of things that that will guarantee is – and this is an important part of this fellow Joe's claim – if you're going to fill it in, you're going to fill it in with what would be legitimate grounds for that arrest to take place, and not with some quirk or some erroneous arrest. Then the question of what can be left out of an account – especially where it's the thing that's left out that provides for the crucial action to happen – is another rather crucial thing to consider. For one, that's the way that the condensation of an account can take place. The work of digging out what's being said is, then, the task of the hearer, and one can leave out what one knows the hearer has to fill in in a specific way. That is, the hearer is not going to say "Rolling up his pipes is nothing to get arrested for," but there is some sequence, of which that is the first move that occurs, and when the actionable move occurs, then the arrest takes place.

In fact, it's not simply the case that a hearer can fill in such a blank. They can do that, but they can do a lot more. Here is a piece of conversation which has the following kind of setup. A fellow is calling a counselling agency in regard to the trouble he's having with his wife. It's quite early in the conversation; a first conversation between two people who don't know each other. 'A' is the staff member, 'B' is the caller.

A: Yeah, then what happened?

B: Okay, in the meantime she says, "Don't ask the child nothing." Well, she stepped between me and the child, and I got up to walk out the door. When she stepped between me and the child, I went to move her out of the way. And then about that time her sister had called the police. I don't know how she – what she –

A: Didn't you smack her one?

B: No.

A: You're not telling me the story, Mr B.

B: Well, you see, when you say smack you mean hit.

A: Yeah, you shoved her. Is that it?

B: Yeah, I shoved her.

Again, it's not like they're old buddies. The secondary characters here are just named categories, i.e., 'her sister.' He doesn't know her sister, doesn't know if she's short-tempered or what, doesn't know how B and his wife get along, or what B is wont to do if his wife does something. Nonetheless it's not simply the case that he has some idea of what it is that would provide for the sister to call for the police, but when he's told it's not so, he takes it that there's a lie going on, and he's in a position to insist and not simply to guess at what it is that transpired. In that sense, then, knowing what are good grounds for the police to come is something that permits him not only to fill in a blank, but also to deny a statement which proposes something else, with no need to specify anything more than 'me and my wife,' 'her sister,' 'the police.' What is in operation here is the pure categories, and their organization, and what's known, given their use. The guy who calls is in no position, apparently, to say "How do you know?," "I'm telling the story," or whatever else. It's not simply then that the guesser feels quite assured in proposing what it is that happened, but the other guy is just as well in a position to see that the guesser had good rights to do that. I take it, then, that one of the things we would not be saying is, it's a matter of style whether one leaves out a sentence that might be put in.

How that can happen is of tremendous importance, and it tells us a great deal about what it is that, among a set of persons who don't know each other, nonetheless can be taken as so about how the world operates, *in its particulars.* That is, on a single occasion. It's a different kind of business than, "If you go hotrodding you're bound to get caught." It's on *this* occasion the cops arrive. How come?

Now, with such a guide, you could begin to see such issues as, what the task would be of a foreigner to understand that thing. Suppose you were to translate this. The issue would not be anything like, do you come up with a word-for-word translation? What you have is do is build in characterizations of the way a set of institutions operate, the way sets of persons know what anybody else knows, and the like. Just to provide for a quite ordinary segment of conversation.

The big question is how we come up with clean ways of formulating what

the kinds of condensation are. You could ask it in a fashionable way: What would it take to have, as the staff member in that last conversation, a computer? What would it have to know, to be able to engage in a little conversation like that? If you could build computers that could gossip, then you would have a formal characterization of what a culture was. And the character of what these condensations are, is not to be supposed as satisfying any unexamined notions of what, let's say, we take to be prototypical kinds of condensed talk, like talk in mathematics. That's in part the problem with Reichenbach's seventh chapter, where he simply will suppose that when persons use terms that have a known logical sense – like 'and' – then that's the sense they have.

Returning to "the guy'll pick the guy up." Earlier I mentioned this notion that some activities are bound to some category. And I take it that when we hear "the guy'll pick the guy up" we use 'pick up' as an activity that 'cops do, to provide that 'the guy' is 'a cop.' And we don't find ourselves in the position of being confounded by the antecedent rule, which would say 'the guy' has to be the fellow introduced as 'a guy,' since 'a' followed by 'the' is a perfect way of indicating that the same person is being referred to.

There's a kind of elegance to the use of 'the guy' there. It is in the first instance a tremendously awkward kind of way to say the thing, "the guy'll pick the guy up." To have it that 'the guy' here is not the person who is introduced as 'a guy' earlier, would seem to be generative of further trouble. But once he's got this ambiguity going, he has an opportunity to reintroduce one of the crucial assertions of the whole segment, and that is, "in the dirty grubby T-shirt." So that grammatical awkwardness provides the occasion for emphasizing what he's trying to emphasize, where, were he to do it in the grammatically proper way, such an occasion would not be available as it is here.

And we can find that 'dirty grubby T-shirt' is something that is emphasized, independent of its being repeated, in the following ways. First of all, the whole statement is hypothetical. Every clause in it is hypothetical. In the whole statement, there is one use of the most standardized way of making a hypothetical statement, that is, the 'if' in '. . . and if I got a tie and a sweater on . . . '' What that single usage seems to involve is, given that there's a whole set of things that are introduced as precedents to someone's getting picked up, how is it that he's going to focus on what he takes to be the crucial differentiating thing for that happening? It seems that he marks that crucial contrast with 'if.' Where, then, we can see as parallel construction, "and if I got" and the subsequent "and he's in;" that is, we get not simply the difference between my being clean and his being dirty, but the parallel construction ('and if,' and then again 'and if,' with the 'if' dropped out – and you don't have to have the 'if' in such a parallel construction) sets those things up as what differentiates.

Furthermore, 'dirty grubby' is an emphatic construction in itself, in a variety of ways. First of all, it's a double adjective; the same thing being said twice, which is kind of characteristic of kids, and characteristic of this fellow,

also. Then, it's not just a doubled adjective, but a doubled one that is soundwise emphatic. 'Dirty grubby,' 'teeny weeny,' things like that.

There are other things involved in this, as well. 'Grubby' happens to be the way that one of the members of this group gets referred to. A way they get at Henry is by characterizing him that way, and apparently he does, indeed, tend to be grubby. On page 5 of the eight-minute segment, he says, just before 6:30, "I'm not grubby" and that brings a laugh. Now, I've been leaving that sort of thing out; that is, the way that in any statement which is not at all specifically referring to somebody in this scene, they are nonetheless doing that. That would have to involve providing much more transcript than the eight-minute segment.

Lecture 10
Clausal construction; Hotrodding as a test

I'm going to continue considering this thing:

> *Joe*: In that Bonneville of mine. I could take that thing out and if I've got a tie and a a sweater on and I look clean? ninety nine percent of the time a guy could pull up to me in the same car, same color, same year the whole bit, roll up his pipes and he's in a dirty grubby tee shirt, and the guy'll pick the guy up in the dirty grubby tee shirt before I – he'll pick me up.

I'm not in a very good position to lay out how, in its details, this utterance gets constructed of a bunch of clauses and phrases rather than a set of sentences, or what each of the variations on what we might take to be the normal form for such a set of assertions is doing – if it's doing something. I pointed out some things earlier, and I can point out a couple more.

One of the rather obvious facts is that, given this way of constructing his utterance, the clauses are adding up and it's not the case that at any given point – even at the point where we have that question mark (". . . and I look clean?") – that he's said what he has to say. And that's observable by the hearer. The hearer doesn't have to guess that he has more; it's observable that whatever it is he's done, he's not yet finished with it. There are some quite clear ways that the fact that the utterance is still open at any given point, is done by him. For one, whatever much we might have to say to give an adequate characterization of the semantics of 'if,' it does seem clear that there can be a multiple set of things being done in a statement that contain, at an early point in it, an 'if' clause. It clearly is a marked first occurrence of some sequence in which there will be a second part, the 'then' clause. There may be an overt 'then' clause, or a clause that turns out to be a 'then' clause. Where, then, as long as the 'then' clause hasn't occurred, the utterance remains open, and one can wait to examine any given further clause to see whether that is the 'then' clause, and can close the thing off.

Or, for example, we could ask what would be the difference between saying "I could take that Bonneville of mine out" as compared to what he does, "In that Bonneville of mine. I could take that thing out," where it's reasonable to say that neither would be heard as a complete utterance. Now, given that we can see, when "In that Bonneville of mine" occurs there's going to be a second reference to the car, e.g., 'it,' or as in this case, 'that thing,' then

perhaps what he is doing with this construction is having that second part provide a contrasted reference to the earlier mentioned car. That is, "If you take a big fancy car out" is what he's introduced in his last statement. 'That thing' can then be, perhaps, not only a reference to the Bonneville, but a contrasted reference to the other – where a 'big fancy car' is a hotrod. That is something that could be done with a clause like that, as part of a pair, 'this and that,' 'that thing' as compared to 'the other.' and it would make part of his argument, which is, "If you go out hotrodding with a hotrod you're bound to get caught" and in contrast, "If you take the Bonneville out, you won't." [1]

There are, further, a set of ways that this thing is constructed which are not exactly consistent with what is proposed to be the way that certain connectors, most particularly 'and,' get properly used. A consideration of those can be found in Fries' book *The Structure of English*. His grammar is terribly important because I guess it's the only grammar of English that was constructed by reference to an attempt to handle actual conversation itself. Fries sat down with a bunch of telephone conversations and built his grammar out of that. Quite unique in that way.

One of the things he proposes about 'and' is that the term on either side are from the same form-class. That means, roughly, adjective 'and' adjective, verb 'and' verb, etc. Seymour Chapman then extends Fries' form-class use of 'and' to handle similary constructed clauses. That's in a paper called something like 'English sentence connectors,' in a book edited by Marquand, entitled *Studies in Language and Literature*. Now, what we have in this statement of Joe's, are clausal uses, except that they're kind of queer. Take a sequence like this: '. . . roll up his pipes and he's in a dirty grubby T-shirt and the guy'll pick the guy up . . ." The consecutive clauses do not seem to be similar, but they are separated, in a way. That is, there those pauses: "roll up his pipes" pause "and he's in a dirty grubby T-shirt" pause "and the guy'll pick the guy up . . . etc." We could treat those pauses as putting "and he's in a dirty grubby T-shirt" in parentheses, and then we can notice that "roll up his pipes" and "the guy'll pick the guy up" *are* of the same class, and 'and' connects them, i.e., "roll up his pipes . . . and the guy'll pick the guy up." The 'and' preceding "he's in a dirty grubby T-shirt" is connected to "and if I got a tie and a sweater on and I look clean," and there it does the same sort of work. So what we've got is non-consecutive uses of those 'and's, which nonetheless do the same work that they would be doing if they were consecutive – and how he comes about to break these things into this non-consecutive fashion, I can't really say. But what we've got is a series of parallel clauses: "If I got a tie on" and "he's in a dirty grubby T-shirt," "I could take that thing out" and "he could pull up to me," etc. We've seen earlier that this guy uses these parallel constructions very much, e.g., "you're

[1] Some of the class disagree with the proposal that the distinction is between 'hotrod' ('big fancy car') and 'Bonneville.' They take it that, as one of them proposes, although the "Bonneville really isn't a 'big fancy car' (i.e., a 'hotrod'), this kid is trying to pass it off as one." To that, Sacks replies that if they had access to more of the transcript they could see that the distinction holds.

bound to get caught" and "you're bound to get shafted," and a whole series of others like that. What they are, I don't have any idea.

In Joe's first statement, he said "If you take out a hotrod and you go hotrodding you're bound to get caught." Now what he does is to substitute for the hotrod this Bonneville station wagon, and he here reposes the circumstances of getting caught, where both persons are using "the same car," and what differentiates them, and what turns out to be relevant to getting caught, is how they're dressed. So we have a sequence of moves: It's not simply, now, that they're not driving the hotrod, but even driving the Bonneville there is a chance that they'll get caught, and the way that gets reduced is by what he wears.

What I want to do now is try to lay out, to some extent, what some of the conflicts are between the guys in this discussion, and what things they are proposing. I partially considered what the other guys are proposing a couple of days ago. What he's arguing, as I see it, is that your basic aim ought to be to go speeding while minimizing your chance of getting caught. And to minimize your chance of getting caught, there are a set of constraints which are put on how you go about doing it. If you don't use them, you can't win; so he proposes. From the hotrodder's point of view – if you can take the others to be espousing that point of view – such a position misconceives what they're up to. What they want is not a guarantee that they won't get caught. If they had that, they would have lost right then and there. They want a situation in which they can expect to lose, because what that permits is, if they happen to win, the formulation of explanations for having won.

That is to say, if it's the case that not many people get picked up in a Pontiac station wagon, then if you don't get picked up in a Pontiac station wagon, there's no problem which needs an explanation. If, alternatively, most people who go hotrodding get picked up, then on any given occasion when you don't get picked up, there's a problem which can be explained, and which can legitimately be posed as, "How did that happen?" At that point, and into that problem, can be fitted 'skill,' as an explanation.

It's in that regard that why it is that one chooses an activity like hotrodding, that involves violating some legal norm which is an important legal norm, can be fairly clearly seen. What you need in order to get the possibility of the proving of skill, is a situation where, if some given activity has been done, 'A', then either 'B' or 'not-B' are both observable. That is to say, both 'getting caught' and 'not getting caught' are observable things, so that you can say that 'not getting caught' is something that happened, or that 'getting caught' is observably absent.

And of course an enforced legal rule is a rather usable object for this test of skill. So it's not at all the case that if they could be guaranteed that they would not get caught, that's something they would want. It's a misunderstanding to suppose that drag racers are simply playing each against the other. They're play against the cops just as much. And they need the cops, because they need the cops' catching or not catching of them to formulate that they have done

the thing correctly; to even pose the fact that something has happened which they could have done correctly. In order to have a situation where you need an explanation, so as to be able to put in the explanation you'd like to put in, then what you need is some situation where these B or non-B alternatives are both equally observable things. If not many people get picked up, then if you don't get picked up, it's just that not many people get picked up.

Now the confrontation with the police is not simply accounted for in this way, though that's a good part of it. There are some other things, and if, when I'm talking about them, I use a kind of glorified language, let me just say that it's the language the kids use. These kids, and other kids who are routinely engaged in observably deviant activities, regularly formulate the problems in the same way. They start out with the fact that, in just cruising the highways, they are observably deviants. That is to say, they are seen as 'hotrodders in their cars,' and they are seen as persons who either have just finished, or are just about to, or in any case are routinely engaged in, speeding. The rules of the game are that anybody who speeds can be arrested, but they're in a situation where, further, they know that the cops can, if they care to, arrest them at any time. That's not simply because the cops can say that they were speeding, but because their cars, as with anybody else's car pretty much, if stopped and examined by reference to the criminal code, will be found to have one or another technical violations. As they put it, "Last weekend they were arresting people on Hollywood Boulevard for dirty windshields." And they know that anybody other than those who are observably deviant will not get arrested, unless there is such an occasion as speeding. What they can then examine is whether the police will conform to the rules that the police ought to conform to, i.e., treat them as they treat anbody else, or whether they'll succumb to the temptation to violate the rules of the game and make an easy arrest.

And in their observable deviance, then, they have a means of learning whether or not people like the police are worthy of respect – whether *they* conform. And if they don't, then of course they can say, "They don't conform, why should we conform?," etc., etc. In any event, you'll find that they're terribly carefully oriented to the fact that these others do or do not play according to the rules of the game. And the best way they have of testing that is, of course, to put themselves in the situation where they give a deep temptation to the others, to violate. Then if they don't, you can say they're respectable. They get a view, then, of organizations like the police, which others don't have available. And it's a very persistent topic as to whether, and how, the police do or do not behave as they ought to, or whether they just pick you up because they know they can pick you up – since, for one, if anybody sees them pick you up, the others all have an explanation: You must have been hotrodding. (Negro gang kids have exactly this same orientation. They engage in long complex discussions, which are morality discussions of a standard sort, as to how the police behave, and who is worthy of respect.) So these kids have a way of checking out the extent to which that moral order that they're supposed to conform to is followed by those who are its enforcers.

They've got a way to test it, they test it with perfectly good will, if they get arrested for speeding, that's the way it goes.

There's really, then, a tremendous ethical conflict going on between that position and what Joe is proposing – which is something like an adult speeder's view; that is, if you look perfectly square then you're in a position to get away with violations that others would never get away with. And he's proposing, then, to use that cover of his clean appearance, to generate violations while being protected from being caught. For him, then, if he were to do it, he would be gaining lessons in cynicism. It is also the case that what he's proposing is not available to any given kid; that is, he's proposing to use a set of resources that any given kid would not necessarily have. And their concern is to try to set things up so that any given kid would have a chance to participate in just the way that any other would, and, of course, to get a view of how that legal order is operating.

The extent to which either of these alternative strategies get used, and what consequences they have, are matters that I am in no position at all to say. I have little bits of data like this, and not anything much larger than that. But in very different materials one finds the same preoccupation. So it may be that the conflict that's set up here is not really terribly atypical – if that's at all relevant.

Lecture 11
Espousing a rule; Exemplary occurrences

Considering that statement, "If you go out hotrodding you're bound to get caught and you're bound to get shafted," there are some things about it that we ought to note. First of all, the maxim that quite obviously follows from it – that you ought not to do the thing – is itself not asserted. So that what we get is the parts of a syllogism device as the basis for finding that maxim as appropriate. The character of that maxim – that you ought not to do it – is something that we could consider by reference to the fact that it isn't asserted, as well as by reference to some other features of the way it's used.

One thing is, that with a maxim like that one, even supposing that someone proposes it overtly, there are some alternatives as to what's to be made of it. For example, it could be treated as a more or less purely affiliative statement, i.e., something prefaced by 'I believe, and I am a member of those who hold the belief that this is or is not a proper thing to do.' Where, then, an answer might be an assertion that those who hold that belief are members of some group that we don't affiliate to.

It is to be noted that in the variety of maxims that are implied by Joe's two positional statements, they are not explicitly proposed by reference to the fact that he thinks they ought to be followed because they are, e.g., good rules, or whatever else. So the advice he can be offering is the type which both the offerer of, and the one who accepts, can offer or accept without any commitment to those persons who have built them, those persons who enforce them, etc. They're only 'good advice' to anyone who lives in a world which is at least partially governed by the fact that if you do 'A,' 'B' is liable to happen. That is to say, Joe isn't saying that you ought not to do it because it's wrong – where, if he said that, then they could simply claim that he was a traitor among them, or perfectly clearly an adult in child's guise, or something like that. While the technique he's using does not foreclose such a possibility, it is very generally used. That is, the claim that some rule which one does not claim is correct or good or whatever, ought to be followed by reference to whatever it is are taken to be the interests of the persons being so advised. Presumably it's a major technique for social workers dealing with street gangs and that sort of personnel.

In fact, the character of the warning or threat which is asserted via such a technique, is the basis for the kind of phenomenon most technically explored in the works of Thomas Schelling. These are a series of war-game type things, one very classic technique, which has a weak form and then a much stronger

form, goes like this: You can listen on the radio to the announcements of government leaders, and they will often make statements of the following form: "If the US keeps on its present course," say the Russians, "then it's very likely that war is inevitable." Where they're making what looks like a mere prediction, the follow-up of which they have nothing much to do with. They're not proposing you ought not to do it, or that they think what you're doing is bad, or that they will have anything to do with those consequences. It's a natural fact of life. And for that kind of thing to get strengthened, the classic military procedure is, I suppose, the kind of thing that was in the movie, *Dr. Strangelove*, but can be found in places like Schelling, and that is, to set matters up so that the consequences you propose naturally to happen, will happen as an inevitable consequence of some event. So that if, for example, a bomb explodes in a certain place, it will automatically and beyond the control of anybody involved, set off a reprisal which has been electronically geared to this possibility. Governments tend to do that sort of thing, and the US, for example, uses the phenomenon of public opinion in that fashion, when they propose that it's necessary, given public opinion, that this or that military strategy be enforced. It does not matter, apparently, whether the consequences function electronically, or whether it is simply a matter of the fact that certain events will have their emotional consequences for a public − allegedly or in fact. And it's not a matter, either, of whether you − whoever it is who's proposing this thing − are not the one who mobilizes that, and in fact can ignore it.

So statements of this form seem to set up problems, the solution of which consists of making them more and more descriptive in fact. That is, because these are problems, if you can satisfy their conditions, then you've got a powerful maneuver; so you arrange things so as to satisfy their conditions. If you could have a statement to the effect that if the Soviets move their troops in the following way, then, without respect to what you can do, the following will happen, and they can see that it's so, then of course it pays to arrange things so that that maxim now holds.

And relatedly, it is important that if one is attempting to get a set of persons to modify the behavior of some others who would stand in opposition − or who certainly stand in no commitment − to the set of rules you hold, then you want to be able to permit those who are going to espouse those rules to come on as perfectly well understanding the circumstances of those they're talking to, perhaps even affiliating with them, but in any event, not at all committed to the correctness or the moral rightness of the positions they're espousing.

In, I believe it was the 6th century, the Catholic missionaries who went to Catholicize England, wrote to the Pope saying, "These people already have a religion, and it has all sorts of features to it; for example, they have places where they worship, etc. What do we do about it, do we destroy them? After all, they are heathenish places, and how in the world can they be accepted or acknowledged by us." To which the answer came back: "Leave them. In fact, encourage them. What you want to do is fit our terminology and our ways to whatever given ways these people have. We'll be around a lot longer than that

one will, and over time they will have forgotten what the other religion was, and we will nevertheless have maintained whatever power it has over them."

What the constraints are on human nature, is something that we want to discover via an investigation of how it is that they in fact do whatever they do; where what we're trying to do is to see what is it and how is it that some ways they have of doing something works, and what its import might be. Now here we start out with a routine argument of a fairly trivial sort: If you do X, Y is bound to happen. There are reasons why it seems to be a quite powerful one. We can get lots of examples of it. We can find that it's used by persons who hold to rules without regard to whether they're efficacious or not, and they offer the efficacious formulation to those who don't hold the rule at all. For one, that permits the ones it's been offered to, to accept it and to proselytize it without themselves changing their affiliation. If each person who accepted the rule had to espouse it for its moral correctness, then each time someone accepted the rule, he might now be expelled from the group he was in, in the first place. Suppose you convinced a kid that he ought not to hotrod because it's bad. Each kid who was so convinced, might no longer have any access to the hotrodders, who would treat him as a turncoat. What are the circumstances under which somebody espouses a view that's not held by a set of members, and can still talk to them? Just consider the question that's in the air about these guys coming back from North Vietnam now. What are the circumstances under which they could possibly be in a position to say the war ought to be ended?

Now, one of the other things I want to examine for this is, it is perfectly well possible that no matter how you happen to espouse a rule – that is, for its moral correctness or its efficaciousness – you're liable to face the circumstances of being called a member of the group that espouses that thing. and when you're called that, the rule is thereby treated as irrelevant. The way that happens has to do with the kind of things that, in their queer way, philosophers have been much concerned with, at least early in the century. And that is, as they put it, if you assert some moral rule, are you doing anything more than asserting your affiliation?

Pretty much all that is interesting about that is, that it is indeed the case that the way members account for and, often, explain away some asserted rule is by aserting that category for which it is the case that its members hold that rule. They can do that effectively when they propose to be members of something that stands in alternation to it. And it is along such lines that how it happens that arguments end up in name-calling would be laid out. Given a position, a category is assigned in terms of which that position would have been generated – where there are alternative categories. A situation is opened, then, in which those members who have not declared themselves are now warned that the positions they take will involve them in affiliating to one or another of the categories that are now present. For each claim that Joe makes, then each cateogry that's offered as an account for those claims is being proposed to Bob as, do you want to be called one of those? If so, take a stand with this guy. If not, don't say anything, or oppose him.

There are two different ways Joe goes about making his position. One is that statement that has as its obvious inference the maxim 'don't go hotrodding.' The other is through this hypothetical singular occurrence, which it seems he's proposing to be fully generalized. 'If I . . . etc.,' where the 'I' is now merely a person in this thing, where what he says holds for whomsoever. And that generalizability is of course attacked in the return to it which says it's not generalizable i.e., 'Not many people . . . etc.'

We could call that second statement of Joe's either an exemplary occurrence or a hypothetical exemplary occurrence, and wonder whether it matters that it's hypothetical or not. And indeed, it needn't even be clear whether it is hypothetical or not, because he can use the 'if' form for an actual occurrence, simply to show he's going to make an argument from it; where you use the 'if' form in order to make it stronger. That is, the sheer fact it occurred may have no consequences. If you just say, "On a given day the following happened to me," the hearer can say, "So what?" If, however, you say, "If I do the following . . . " then you're making of it a general argument.

Now the phenomenon of 'exemplary occurrence' is fundamental for the following kinds of reasons. It seems to be the case that a large amount of the knowledge that Members hold about how the society works are, as I earlier put it, 'protected against induction.' And what that means is that it isn't automatically modified if events occur which it doesn't characterize. The question is, does that mean that there's no way that it can get modified, and if not, how does it get modified, where the question of how it gets modified can be quite important.

There could be all kinds of models of how it might get modified. One might be, you store up a bunch of exceptions, saving each one, remembering them, and when you get a whole bunch of them, you're forced now to say that what you supposed were so is not so. For example, the first Negro you meet turns out not to be what you know about Negroes. You store that up as information. When you've met ten, and they all turn out to be not what you've been told, you say, "Well I guess that information is incorrect."

Now, things are not done in that fashion. Let me give an account of a particular situation, so as to show what the consequences are, of their not being done in that fashion. One time I was engaged in trying to see how it is that coroners make decisions that somebody did or did not kill themselves. Those things are handled case by case, one at a time. A case comes in – let's suppose it involves a body being found with a pistol wound in some particular area of the head. The area matters, because the coroner can determine that if the wound is in a certain area it could be an accident e.g., the person could have been doing such a thing as checking whether there were bullets in the gun, etc., whereas if the wound is in other places, then the person must have had the intention of killing themselves in that way; that is, they wouldn't have otherwise been holding the gun in such a position as to lead to a wound in that area of the head. They go through the cases, and each one may get decided via one of these rules.

If you said to the guy who was making those decisions, "It's a probabalistic

argument; probably in five cases out of a thousand, it might well be that somebody accidentally had the gun in that position," he'd agree. And now there could be a variety of ways of considering that five-cases-in-a-thousand phenomenon. One would be to take a thousand cases of this sort, save them up, then make your decision on all of them together, the five queerest ones will be called accidents, the other 995, suicide. That's not what's done. What's done is, each case comes up. For each case there's only a five-in-a-thousand chance that it could be not-suicide, so each one is decided to be suicide. Furthermore, when a problematic case comes up, what's said about it is, "There's a very small chance that it could be an accident; it's not very likely, and furthermore we've always found that they are suicides." And the fact that, that they've 'always found' consists of their procedure for deciding that, does not seem to make any given determination problematic. That they've 'always found' is used to, in fact, urge that the next case is like those that we've found. So you don't get the adding up of the troublesome ones, about which can be said, "Well, there are always some that are sort of troublesome but they have always turned out to be suicide." I take that because it's a rather stark example, but consider how people deal with excuses, and a variety of other such phenomena; they do it in the same way.

Now then, the problem is how do these shifts take place in that knowledge that gets used on each case, and for which the fact of exceptions occurring turns out not to be relevant in each case; even though they will be fully recognized as sometimes occurring. To extend the point a bit, consider for example, those things which I'm sure have happened to you, where you know that such things happen, you've heard that they happen, people tell you that they happen – except that when they happen to you, you also know that you could never tell anybody that they, in fact, happened to you. That is, they happen. But they happen to nobody, on no given occasion. And you realize you can't tell anybody about it, except, maybe, to say that it happened to somebody else.

Now the phenomenon of an exemplary occurrence is apparently a kind of way that a large shift can take place. And in the case of suicides, just to continue that along, things could happen as follows: Until now, deaths at railroad crossings, when a car gets hit by a train, are presumed to be accidents. Then somebody says, "We've had a whole bunch of these recently, they've all been decided as usual, but this one looks interesting." They examine that one, and it turns out that it's extremely unlikely that it could have been an accident; the train could perfectly well be seen, and, further, the road was so situated that the car could not have been seen from the train. Suppose also that they do what has been done by people like those in the Harvard School of Public Health; say, take the car apart afterwards. They find that there weren't any brakes at all; the driver had taken the brakes out so as to prevent, even if they'd wanted to change their ways at the last moment, the car possibly stopping. Then, through such a single case, the rule might get changed. Now it's the presumption that if there's a railroad crossing accident of a fairly general sort, it is suicide.

That matter may seem to be not terribly consequential in general, except that there can be a whole set of circumstances where a rather general and important moral rule of one sort or another gets handled in the same fashion. The import of certain kinds of crimes, when they get publicized to some extent, is that persons now begin to talk of the outcome of that trial implicating how it is that the legal system works. So people said about the Chessman case during its course, that if he didn't go to the gas chamber, then everybody would lose respect for our legal system, we would be giving free play to deviants, murderers, whatever else, and that everybody would take it that they could no longer hold the rule that the legal system by-and-large works correctly.

That means, if exemplary occurrences can be formed up out of a single occurrence, and if they can have the consequence of changing some people's knowledge, where furthermore the new piece of knowledge will have exactly the same form as the old – that is, it also will be protected from induction, then matters are extremely tender. You don't get a step-by-step modification of something. It's frozen, it shifts, and it's frozen again. Then the focus on single occurrences is not that they are an exception, or that they slightly modify what you know. It can be an attempt to shift whatever anybody has known previously.

Lecture 12
'Tearing down;' Non-translatable categories

I'm going to finish up our consideration of this segment by dealing with some of its more overall features. We could say sort of roughly that the segment itself has a kind of introduction, which is that one sentence that they all put together, then there's an argument for a bit, then what may be a transitional segment which is that three-utterance interchange, "Face it you're a poor little rich kid," "Yes Mommy," "Face the music," and following that, what they eventually call this 'tearing down.'

Now 'tearing down' is a procedure that can be done on a large variety of occasions and in a large variety of settings, and one of the things we want to ask about it is, Does it have any special place in the therapy situation, for one, and at this point in the therapy situation – whatever point this may be. The way I'm going to approach that is to ask whether that procedure which they call 'tearing down' has any interesting relationship to what it is that at least the patient in a therapy situation takes to be going on, at least some of the time. One reason we could have for asking that sort of question might be, we might feel as I feel that this segment is a kind of sample presented to the 'company' or new candidate, as to what it is that happens here. And we want to see in what way it might be considered to be a sample.

Here is a piece of a conversation which takes place between a staff member of a psychiatric agency and a woman who has, as she takes it, very serious troubles, but who is very hesitant to go back into therapy. There's an attempt to convince her to do that, but she offers a characterization of therapy as she experienced it before. She says,

> A: I stopped at a very bad time, I know I did.
> B: Uh huh
> A: But the job situation got moving and I   I stopped right when I was beginning– well I would have been better if I had no therapy than to stop when I stopped.
> B: Yeah, sounds like it.
> A: Cause I stopped right when I was looking at the whole gory mess.
> B: Uh huh
> A: Before it started, you know, before I started to clean it up a little.
> B: Uh huh
> A: Was like a surgeon getting down to the disease, you know, and all of a sudden he opens you up and there's disease. Wow.

B: Uh huh
A: He knows what it is and quits there. (laughs)
B: Yeah, I suppose that's it.
A: (laughs)
B: That's a good example.

She offers this image, then, of being cut open. And that image of first being torn apart as a first part of a therapy procedure, is one that, at least patients hold often, anyway. What, in part, it consists of is, apparently, taking varieties of things that the patient says about whatever, and either explicitly formulating for them, or in some way leading them to see, that some set of terms characterize their circumstances, where the terms can be more or less technical in one or another way. Like, in the case I just quoted, right at the beginning the doctor says, "Tell me about your problem" and she says, "I'm ashamed to. I don't want you to tell me I'm infantile, because I know that."

That obviously can stand in some fairly nice relationship to what transpires in this segment, and her characterization of what happened to her might stand in some very nice relationship to that 'tearing down' procedure. And many analysts of initiation procedures in general, and the early stages of things like being hospitalized in mental hospitals, going through therapy, etc., talk of them as degredation, mortification, stripping of the personality, and the like; any of which might well be seen as the same thing named by the phrase 'tearing down.' But there's a really deep problem involved. I don't know the best way of presenting the problem involved in sentences that have the form, "Don't tear him down" or "I don't want you calling me infantile," but I'll try a couple of ways. They may not seem initially to be just in point, but hold on to it for a bit.

At the beginning of a book called *Excess and Restraint* by an Australian anthropologist, Ronald Berndt, we find him doing what anthropologists occasionally do, and that is, to formulate what it is that he takes it he was seen as by the natives when he arrived at this place that he went to work in. This is from page ix of the preface:

> We were viewed as returning spirits of the dead who had forgotten the tongue of our fathers and wanted to relearn it.

Grammatically, that's perfectly good English. I want to make the case that it's an asemantic statement. That is, it is not meaningful in English, though it appears to be.

The first part, "We were viewed as," is fine, and there are lots of things that can be stuck into that for which this first part is a frame. And that frame to some extent controls what can be put into the second part, in the sense that there are lots of things that could be used as second parts of sentences, that don't fit here, syntactically or otherwise – for example, that isn't the kind of thing you say about humans.

I suppose it has to be clear that the second part, from "returning spirits"

on, is some kind of translation from another language into English, and, in part, that it *is* a translation is a considerable part of its warrant for being said. Such that, if Berndt stood up at an anthropological convention and said, "I, Ronald Berndt, am a returning spirit from such-and-such," that would be good grounds for them to think he's insane. That is to say, if this were English, it could not be a potentially correct description of what he might be. But there are apparently ways that, if you take words one by one and in some combinations, some combination of them can be produced to look something like a Members' category. Those words could somehow go together, and be recognized as 'a something in some world.'

We have some way of handling such a statement because you can say, "Well, the initial thing is that he's a stranger, and that's some way of characterizing strangers that involves somehow making him some sort of member, and that must be one category that these people either had or devised for handling such persons." But we would take it that, except as a matter of syntax, none of the controls on correct use of that clause 'returning spirits . . . etc.' are found in ordinary English. We would not know when it's been said correctly about someone, what are the consequences of it being said, what you can infer from its being employed, etc., etc. It would be a sentence, then, if it had any distribution in English, which would be reporting what it was that was taking place for these other people. And it isn't a proposed introduction into English, I take it, of some category that we've lacked and now are enriched by having. So, for example, until the term 'schizophrenia' was invented, it could be said that we lacked that category, and that given it, a body of experience, a set of observations, etc., could now be ordered, and 'schizophrenia' now stand as their name – and be used, furthermore, as other disease names might get used. But what kind of experience this term 'returning spirits . . . etc.' orders, and what class it would be a part of is, at least to me, quite obscure. And yet there's a sense in which we do understand, by some mapping, what sort of thing he is talking about. And that, of course, is an extremely interesting kind of fact.

The sentence, then, is an odd one, and the introduced category is not, as we might put it, generative. That is to say, it's not like a Reader's Digest word which, now having learned it, there are lots of places where you can use it. But there may be somehow in there, an exploitation of English syntax in making the translation and building a sentence like that. And that is, in part, I suppose, why anthropologists will frequently not do this, but will say, 'We were viewed as . . .' and give you some phrase in the native language, and then say explicitly, "What we have here is a gloss of something that might mean the following sorts of things in English." But they still use the native term, because then you can't use the term in English; that is it remains a term from that other language.

I introduce this sort of consideration since I want eventually to make the case that one of the core problems for psychoanalysis and other psychother-apies, and the social sciences in general, concerns the relationship between the categories that those disciplines set up and the categories that members of the

society otherwise use. The problem is that somehow members take it that such categories – 'manic depressive,' etc. – are additions to a list of categories that exist already, and can be used in just the same fashion that the old ones are usable. They may be better, but they do not otherwise modify the structure of the class, of which people come to be seen as members. However, the professional constructing these new categories may take it that one major task he has is to somehow build them so they are unusable in the way that the categories he sees them as replacing were usable. That is, the professionals put it as a programmatic task that they would like to have it that the statement "You're a manic depressive," for example, would be nonsense in ordinary English, i.e., unless said by a therapist.

When Freud set out to build a 'scientific psychology' as he put it – and that program of his, to build a scientific psychology, was among the last things he ever got translated into English – one of the tasks he felt he faced in the first instance, was to deal with the fact that everybody considered themselves to be an authority in psychology. He was not locating a domain which persons could take it from the beginning they had no idea what it is you might say about it. But it wasn't, of course, only the case that they had lots of views, which they took to be well warranted, on psychological matters, but those views, and the categories they used, were not morally neutral. That is to say, in part, that any time one of them was asserted as being so about somebody, it was also the case that some assessment of their status was being made – as a good citizen, or whatever else.

Now, in many views of what could be called the philosophy of science, it is taken that technical findings stand in some position of replacement to lay findings. One can often have a picture of the state of lay knowledge which stands in a strong relationship to what scientific knowledge is supposed to look like. That is to say, that it's a set of items about any or every given topic, where what happens is, when a new item is introduced, it can operate to expunge an old item. That goes for correct scientific procedure, and it has been taken to go for what is called lay knowledge, as well – with some delay perhaps, but essentially the same kind of thing can properly take place.

That's a kind of tricky argument if you're dealing with the structure of lay knowledge, although it can be perfectly well satisfactory if you're dealing with the structure of scientific knowledge, in that you can set up by fiat what the structure of scientific knowledge is, and you might get a list of items, and you might, then, at any time, remove an item as a new one comes in that seems inconsistent with it. However, what the structure of lay knowledge is, would obviously be a problem for some discipline. It's not in the first instance known. It clearly has been a subject of some consideration since the Greeks, anyway. And to propose that it's a list of items is to make a rather daring assertion. But it's one that has been made.

As a further problem, there is the fact that it seems if an item is now introduced to the scientific corpus, then the controls on its use can presumably be very well laid out, and whether it is correctly used can be something insisted on and enforced. And furthermore, it can be presumed that if it's

incorrectly used, you will in fact have hell to pay; that is to say, consequences will just show up if you misuse some item. Now it's not clear, in the first instance, what kinds of uses these items do have when we're talking about lay knowledge. It's by no means clear, either, that they're only the same uses, or that 'error' – if we can formulate that – has the same short-run or long-run chance of showing up.

For considerations like the ones I've offered, there is some considerable concern about who would have the right, at all, to use new scientific knowledge, or techniques, or whatever. Because, for one, if it became something that anybody could use, then God only knows what might be done with it. And the simplest way for it to become something that anybody might use, is for it somehow to be seen as a member of the corpus of correct knowledge, undifferentiated as to scientific or lay. Where it's the fact that scientists say so that permits anybody now to assert and use it – where, however, they need make no special change in how they use any category, to use the new one.

One thing Freud was further concerned about was to somehow prevent persons from using his categories in just the fashion they used the ones they had before. And there's very good reason for that, which is that if, say, 'manic depressive' was a replacement for some lay term like 'cranky,' then whatever assessments that were made about somebody said to be 'cranky' could be made about a person said to be 'manic depressive,' and that someone who was said to be manic depressive might hear it as a kind of attack.

Now, I take it that, probably generically, in the first stage of therapy, anyway, that's what's seen as going on. And the term 'infantile,' for example, is treated as being either the same as the lay term 'infantile,' when someone says to an apparent adult, "You're behaving like an infant," or as some sort of technical term which is nonetheless usable as the other term is. And that is something that, for example, let's say a field like astronomy has avoided, and nobody gets very horrified to hear about the generative stars. But it's not been done in such fields as psychiatry. And the fact that it's not been done has been turned into a tremendous attack on psychiatry, by somebody like Thomas Szasz, who will invoke the fact that the categories are used evaluationally elsewhere, to propose that the phenomenon is that of making an evaluation, and that their isn't anything but that sort of knowledge being used.

That is, I suppose, a strong indication of the failure to cut off the incorporation of new information into lay hands. And it would be in that sort of way that one can see how the so-called 'same procedure' can be seen as one that 'you call X and we call Y.' You call it 'diagnosis' and we call it 'tearing down.' And one can see how, then, these patients could be characterized as giving their version of what it is that's going to happen in these sessions. It remains the case that if the discipline retains the notion of items of knowledge as the things it is basically dealing with, then it's going to have to face the problem that the items get taken and used. One thing that can be done, of course, is to attempt to place anything that could be called such an item into such a structure that if you pull the item out, it's senseless.

Lecture 13
'*Everyone has to lie*'

The transcript of lecture 13 is incomplete and full of gaps. What there is of it deals with the phenomenon that Sacks called 'Everyone has to lie.' It became a paper of the same name, and can be found in M. Sanches and B. G. Blount (eds), Sociocultural Dimensions of Language Use (New York; Academic Press, 1975), 57–80. For the materials in lecture form, see Spring 1967, lectures 8 and 9.

Lecture 14
The Navy pilot

The transcript of lecture 14 is full of gaps. In its place are Sacks' notes on the data he considered in lecture 14, a New York Times *article entitled 'A navy pilot calls Vietnam duty peak of career.' The materials are taken from Sacks' Research Notes, vol. 2a (1964–5), 170–99.*

MCD materials[1]

New York Times Sat. May 29, 1965

From a long article:

> A Navy Pilot Calls Vietnam Duty Peak of Career
> by Seth S. King
> Special to the *New York Times*
> ABOARD THE CORAL SEA, in the South China Sea, May 27

> Commander Jack H. Harris, leader of the Attack Squadron 155 aboard the Coral Sea was explaining how a carrier pilot feels about Vietnam: "I certainly don't like getting shot at. But this is the top of my flying career and it's important I should know about it. I really feel I'm fortunate to get the opportunity after 21 years in the Navy of combat experience. I need it to be a real professional."
> . . .
> How did he feel about knowing that even with all the care he took in aiming only at military targets someone was probably being killed by his bombs?
> "I certainly don't like the idea that I might be killing anybody," he replied. "But I don't lose any sleep over it. You have to be impersonal in this business. Over North Vietnam I condition myself to think that I'm a military man being shot at by another military man like myself."

1   First, we may see one crucial matter here; and that is that he takes it that there are alternative ways that he and those he is dealing with (bombing, being fired at by), may be categorically formulated.

---

[1] 'MCD' stands for Membership Categorization Device.

205

2   Second, that the choice of the categorizations is relevant to the assessments he might make of his activities; now this is so in a strong sense. To wit; that he sees that the formulations have alternative imports, and it is not just the case that the formulations have alternative imports, and that further by some work he is able to choose that formulation which has an import that is consistent with what it is that he is doing, and that permits him to do it without important moral consequences (he is able to continue 'without losing sleep'). This situation of alternatives is then one to be marked as one where he takes it that there is not some exclusively appropriate or required choice of devices.

3   It may be much noted that the choice of the device is not just to be made by reference to what they may make of his actions under some scheme like reference to their consequences or the like, but by reference to how, given the use of the consistency rule to formulate his alter egos, how it provides for the formulation of his actions. The availability then of making his categorization decision in such a way that it routinely provides for a categorization of his opponents, and by virtue of the mutual categorization then an assessment of either's actions is a crucial matter.

4   Notice how it is that categorization can be held in some abeyance or the use of particular devices not be foreclosed while making reference to populations, i.e., the use of 'anybody' and 'someone.'

5   Notice also how the characteristics of the required impersonality are delivered, via the use of 'you' in a usage we have been considering.

6   There are several matters re 'you have to be;' is it the case that if you have to be then you can be; or is it the case that, that you have to be provides the grounds for being.

7   Now the import of the categorization of the others as well as himself, and of the particular device chosen, is in part that an ethic follows, where: what is proper for him is proper for them, or, equally, what is proper for them is proper for him; and also, that the device chosen is not merely one which assigns a category to he and to them, but also it offers a category to them, which they may also use in just the way he uses them, i.e., that with it they may formulate what is happening just in the terms he does, and with the same consequences. If they accept that offer then at least there are no complaints to be offered on their part about the error of his ways, except if he happens to violate the norms that, given the device used, are operative; that is, the device used does not provide that there are no rules for the actions of either.

It is of course to be noted about the given device that it delocalizes the affiliation of the personnel; what is relevant in the first instance is not that we are the military of the US and they of Vietnam, but that we are both military; it is that we are differentially affiliated which provides for who we shoot at; otherwise we are colleagues.

8   One of the things to be noted about 'you have to be impersonal in this business' is that its indexical features, particularly the 'this,' have some special relevance. The statement is perhaps only incidentally correct for the military;

it is correct for other businesses as well. And that feature of it may be quite crucial. For, given the fact that it is true for other businesses as well, that the consequences of impersonality differ may be rather irrelevant; so, businessmen may be impersonal in different ways, or psychiatrists or priests; but if the statement is true for them, and they are in a business for which the sentence is true, they may not be in a position to without recourse to their own circumstances importantly claim that he is doing wrong; for he can answer that the same holds for them with the difference being that their impersonality doesn't directly concern killing. The property of prepared, or general purpose indexical statements may be a rather crucial one; cf. 'That's the problem with society' and others like it.

And we know that persons who are attacked for the peculiar defects of their activities are often seeking to formulate matters such that they can claim that the same sort of defect, if not the details of it, hold elsewhere, for the attacker, and perhaps for matters quite generally. This use of a general purpose indexical statement may be very helpful in such an attempt. And note of course that if one can make such a claim, that it does seem that one prevents the attack from having its intended power; there is something akin to an unclean hands argument. The unclean hands argument is further made powerful by then attaching as a further class beyond its scope the 'ivory tower' or 'bleeding hearts' group as further persons who are in no position to talk, because they've never met a payroll. One needn't then have a single argument to handle every locus of attack; but several can be combined; where the first part gathers a bunch together, and then on behalf of all, one uses the second part (where one proposes that one is defending those who are talking oneself from the first group when one attacks the second.)

It may then be that the use of 'this' with its possible extension being greater than 'military' serves to cut off attacks by anyone who is an incumbent in some business for which the statement is also correct. The use of 'you' in this statement has been examined in the lectures on the first page of the initiation ceremony.

9   One can notice that the relevance of a device with which a consistency rule usage gives: military–military; is of separate importance than 'you have to be impersonal in this business.' For that remark might be made by a professional gunman, and it would not serve as an answer, as an adequate account. Or would it? Or is it relevant?

10   Is there some suggestion such as: If we are both military men, shooting at each other as we ought, then not only is it the case that neither has any position to complain about the proper military doings of the other, but also what we do is in some sense just our business, and having behaved properly, no one else is in position to complain either? Alternatively or in combination there is the issue that having taken care of part of their side by giving them a military man to behave as I do, he being their representative involves them sufficiently; they have no recourse because their side is behaving as ours is.

11   One wants of course to notice that the formulation 'this business' is of interest not only for the 'this' but for the fact that the use of 'business' is itself quite relevant, i.e., the work need not be so formulated.

12   The way that having dealt with the opposing military being referred to the population has been sufficiently handled is via the representativity of certain categories of other categories, i.e., of a team for a city, and of an army for a nation.

13   The remarks about 'this' or that sentence's general purpose character may hold as well for 'it' and the sentence it is contained in, i.e., 'I don't lose any sleep over it.' And the combination may work together to get a general defense which has to be accepted or the attack it succumbs to may be used in too many other places.

14   I take it that it is quite important that the character of the wrongness or possible wrongness of what is being done is not formulated until both the doer and the done to are categorized in some other fashion than 'someone;' though it is apparently the case that the possible wrongness is present once it is established that what is going on, killing, is being done to someone. Thus the someone fact sets up a problem of formulating an account; but given only the someone formulation, the fact that an account can be made is left open, i.e., it is not foreclosed that it can not be made.

Here of course one has to consider the possibility that there are ethics for which it would be sufficient to establish the wrongness if one had found or possibly found no more than that it was a case of someone being killed. Weber on the difference between India and the West.

15   Note also in this regard that 'someone' is sufficient to set up the problem and to deal with it via the categorization and that one need not make a count of how many they are. On the one hand, that is, that one need not know, to make the claim that an account is appropriate, how many in fact; one may suppose that some, or may be assured that some, without knowing how many, and also the account that is constructed is not apparently affected by the size of that some. Though it is the case that if the size is known, that size can be relevant to the need for and the character of an acceptable account.

16   Re earlier remarks; if it were the case that, that you had to be impersonal in this business held only for this business, then it might be that doing this business would be wrong in the first instance, or could be. That it isn't so only for this business is crucial to the usability of the sentence 'in this business.'

17   Re impersonality; it is not simply that in doing the activities this is something one is forced to do, but in the formulation of the account what has been done is that an account has been offered which could be offered by any person involved on either side of the affair; and via that fact the impersonality point gets perhaps a further emphasis; thus having been asked; how do you? (deal with it), there is on the one hand a claim of need for impersonalizing and then an account which is one that is formulated in such terms that it could be offered by anyone involved, i.e., is impersonalized. That is in addition to the

point that the remark 'you have to be impersonal in this business' is a sort of ideal impersonal remark.

18   'Impersonality' as a requirement is of course not an unequivocal object; for it in some circumstances could not serve as part of an excuse, but might be offered as a difficulty, i.e., I wish I could know who it was that I was (killing, saving, etc.) so that I could get special pleasure from that; as, e.g., in certain charities the possible impersonality is handled by one being promised mail from those one feeds, and then some relation is established between feeders and fed of a personal sort. It is not that one has to kill impersonally that it is a difficulty; so that it would be nice if one could kill personally, but that one can't think of killing, or be concerned with that, even if it is in the first instance the case that one does not know who one kills; where one has a possible equivocal that comes on with perfect unequivocality that is of some special import. But maybe no such sense of impersonal is involved; rather, that one has not to consider that one is killing persons.

19   'Over North Vietnam I condition myself;' this pair of phrases is quite similar to; '99 percent of the time a guy could pull up to me;' in both cases the first phrase which modifies some later phrase does not modify the one that consecutively follows it. It clearly could be placed before the phrase it modifies, but it isn't. Clearly enough it can do what it needs anyway, if 'anyway' is relevant; but the positioning freedom is something to be noted if the grounds for the use of the freedom are not yet apparent. (The second quote is to be found in the initiation ceremony data, i.e., group therapy 6 pages.)

20   The clarity of the fact that his account not only holds for him and for any others on his side, but for the ones on the other side is provided for by the fact that what he states is the account that might be offered by one who subscribed to his formulation and who was a Vietnamese military man, i.e., the one speaking formulates, not his bombing as the relevant exemplary actions but his being shot at, i.e., he explicitly is offering an account, i.e., the fact that he is shot at as something he excuses because the other guy is a military man shooting at him, a military man (providing the hope that the other will excuse him as he excuses the other).

21   Query; how can he come to say 'the idea that I might be' as, cf. 'the fact that I am.' One possibility which I want to explore is that there is a kind of transitivity to an indefiniteness feature. Perhaps it is the case that if it is not observably definite that the given actor has killed some particular individual (by which I don't mean someone whose name, e.g., he knows, but that he sees that someone in fact has been made dead) then even though it may be quite clear that the bunch of men have killed a bunch of people – and that they would have failed, for example, if they had not – the non-locatability of flier A killing some person A may permit it being seen as indefinite that he has killed someone; if it is indefinite that A has killed some person, then it may be indefinite that A has killed any person; and if that is so then it may be that he can talk of 'might' and of the idea, as cf. the fact.

Now the point of this is not just with regard to killing, but might have an import in, say, market events, where although it is perfectly clear that the

collection of businessmen have done something that has as its consequence that some collection of others have been injured, the non-locability for each businessman of some person that they have injured may permit indefiniteness to take a transitive relational form, and also to be operative as 'an idea' that one may have to come to terms with; where, that it is an idea that one has to come to terms with, provides a variety of ways that one can use: the ways available for coming to terms with ideas that are unpleasant.

The phenomenon of organizational, institutionalized destruction, cf. Nazi operations, etc. are obviously possibly involved here (Note that one possible, and terribly interesting correlate involves the fact that the 'coming to terms with the idea' can be an immensely painful thing that persons who are 'not directly involved' may feel; there can be, then, a generalizing import to the situation as well; so those involved directly may have the fact of transitivity for indefiniteness and thereby the issue of 'the idea' being a real gain to their circumstances; while those not involved directly can find the idea an immense source of pain. Much current and classical philosophy, theology here.)

In this regard note that it seems that it is the case that to the remark 'There are many things wrong with this,' the following is a good answer: 'Name one,' where, that one cannot be named or is not named is seen to undercut the claim of 'many;' alternatively if one is named then that may have more import than that one has been named; that interchange may also get its character via the transitivity of indefiniteness.

It might be said that having said transitivity we want to be saying that the matter is two directional, i.e., not only if one is indefinite then many. That may be so; have to see.

22   It is of course to be noted that there is not any 'necessary' relation between the possible transitivity relation and that fact that given its operation one must consider the idea, or that one can consider the idea and not the fact. That is partially separate; but it may well also hold that if definite then one must consider the fact; if indefinite then one can consider the idea as cf. the fact (which does not mean the non-relevance of possibility, but: relevance of possibility but non-definiteness of it.) Then, if indefinite, one must consider either (idea, fact) and can consider one of them.

23   We are of course supposing that at least with regard to the combination (idea or fact + might or am) that the choice, whether required or not, of a first, operates to control the choice of a second, and that at least if 'fact' is chosen then 'might' is excluded as a PCD; without however suggesting that if 'idea' is chosen 'am' is excluded. Now we have of course to determine that in fact there are some controls on combination here.

24   The first part; 'I certainly don't like the idea that' is not optional if the position one thereafter takes is to get credit; one can't properly say (with it to have the same reception) either 'I like the idea,' or 'I don't mind the idea' or 'I never thought about it' or leave the space blank – there is a space in the position assertion for that preface; 'I don't lose any sleep over it' is not just incomplete, but it is understood as having 'I don't mind' as its prepart. Thus there is what is literally a formula; 'I certainly don't like the idea that I might

be doing X, but I don't lose any sleep over it;' i.e., + some account which is signalled as coming, by the use of 'but.' In this context the 'but clause' serves to provide that the utterance is still open, and that furthermore something that is proposedly an account of that 'but clause' will be offered. You do X (X is something which without it being said is something problematic, i.e., presumptively wrong); I don't like doing it, but I can, because. This package is a general purpose one and can be used quite widely. In GT, a guy says about his girlfriend, "she's on the girls tumbling team. I mean, she doesn't like it, but she needs the credits" (this may not be exact; the quotes are in the data somewhere).[2] When the formula is present it is for the analyst a strong way of identifying a low valued object, i.e., that thing which is the X in the formula's first part; there is of course also the account part. [*Then*, *handwritten*:] The formula is crucial not only 'because' these are low-valued, but also because they can be done given the formula's use.

25   The first part of the formula, 'I certainly don't like,' acknowledges the fact that the question, 'How do you feel about. . .?' operates on an object which has some feeling about it as its proper one. Thus, the very question involves a tapping into an evaluational schema, and the formulaic return acknowledges not only that, but that the question not only taps in, but indicates that the user is committed to that scheme or recognizes its legitimacy, and that the answerer knows the schema, knows that it generates the question, knows further that there is a proper position to be held, but that having subscribed to the position, a further statement is not foreclosed. And it is that subscription to the position's status that is crucial. Having made it, one can account for the action in an acceptable way. (Note: I am not offering this statement as just about the given piece of data, as ought to be obvious.)

A return such as 'Why do you ask?' would be immensely informative about the subscription the doer of the return has. As perhaps the need to lay out in the question, that some hold that the thing being done is wrong; that is not a stronger, but a weaker formulation than the simple question, 'How do you feel about . . . ?'

26   Notice that the term 'like' is not additive of features, in the phrase 'another military man like myself.' What it is is an affirmation of the consequence of his being a military man (given the fact that I am one). It is an equivalence signalling term, which points out the relevance of the item it follows, i.e., I mention military man because by that I establish the equivalence of this other guy and me, which equivalence is establishable in that case sufficiently by our common locus in that category.

27   It is perhaps the case that the phrase 'another military man like myself' is handleable in part via the remarks on transitivity relation, i.e., if he is a military man, then he is like any other, and being like any other, he is like myself.[3] (It is not directly a class inclusion argument; though the middle is

---

[2] Actual quote: "She's in the girls' tumbling team. (pause) I mean she doesn't like it she's just on it because she needs the credits."

[3] Written in: "No: this is a symmetry issue: will consider it in a bit."

he – class – me; given this format it is obvious that me – class – he is just as usable; the use of the former is tactically nice; for it is me who is being shot at in the first instance. Perhaps then forget the transitivity point here.)

28   'Idea' may be not only sequentially related to 'might' but also to *think* in the next sentence.

29   Notice that there is a nice relation between 'how do you feel about' and 'I don't lose any sleep over it.' The latter is of course an idiom answer; but it is not simply a phrase that has happened to have some standard meaning. In our analysis of 'How are you feeling?' we noted that the specification class of categories that are relevant given the choice of an answer from the negative subset has as one of its members (the PSW class) 'sleep.'[4]

Given that locus of 'sleep' and the conditions of its relevance the idiom is not a merely accidental freezing. (The discussion is in the first instance to be found in the Diagnosis of Depression drafts.) The use of the idiom then may provide in the first instance that there is some relevance to the fact, as I have asserted, or as may be supposed that I am in a negative subset on 'feeling' whether I've said so or not.

What has happened is of course a kind of generalization; where the addition of *about* + whatever it precedes, does not affect the structure of the relation between 'feeling' and the consequences of the negative subset. Retaining then the private imagery or relevancies; as in 'Johnson makes me nauseous.' The test of something's consequentiality, by the way, is under some formulations to be made by reference to whether such intimate formulations of consequences, or such intimate consequences are in fact made to initially public matters. If they are, then it's consequential; if not, then not. Cf. Kennedy's death was like something happening to a member of the family; the war in Vietnam is consequential now because it is affecting millions of Americans directly, vis-à-vis their sons, etc. Now what we want to notice is not so much that or whether such assertions are correct or not, but that they are the ways of making the point of 'effect' strongestly. And that is presumably a culturally relative fact. (Though some theorists, Weber, for one, I think, might argue, or did argue that things had in the end to get posed in this format if they were to count practically.)

MCD (1)

We have not considered whether there are any controls on the sequence a population ought to be categorized in, or whether and how that might matter. Now it can be made clear that it could matter; there is the one person problem; and there is the nth person solution;[5] so, even for two persons order of categorizing might matter.

---

[4] See Spring 1967, lectures 8 and 9, on the phenomenon "Everyone has to lie." A 'PSW' category is a 'Personal State, Which-Type' category, such as sleep or appetite.

[5] See Spring 1966, lecture 7, pp. 325–7.

What sorts of controls are there on the sequence for doing categorization; it may be noted, though the matter is not directly in point, or clearly so, that it may regularly be the case that while there is some freedom in choosing the first person to introduce someone to, thereafter the order may be quite fixed.

To see right off how it can matter, there are certain categories which are clearly not for a population of only one person, and which are first-categorized categories, i.e., their use involves the person categorized by reference to them being the first one categorized in some group that is larger than or equal to two. For example, the categories, murderer, attacker, rapist. And there are some second categories, i.e., whose use indicates that the person being so categorized was not categorized first, e.g., self-defense murderer . . .

These few facts may have some consequences; first of all the set of categories to be used on some population, i.e., those to be chosen from those that might be chosen, may not be independent of the order in which persons must be categorized, or may be crucial to what order in fact is used. The fact that there is some freedom in sequence of categorizing may be quite useful in expanding the set of categories that can readily be used, or effectively be used. At least this could be true for those devices which contain first-categorized categories and second-categorized categories.

MCD (2)

1   Sequence of categorizing may be relevant for which device as well as for which categories.

2   There are some categories which obviously are 'first categorized persons' categories, e.g., 'winner' (win, place, show). It is not always necessary that for some categories which are in one way or another ordered, that the first of the order be the first categorized, or the first category be applied first, but it is regularly done, e.g., regularly the announcement of scores or other contest outcomes are announced winner first. Cf. here, Malkiel on ordered binomials. For some, however, order of categorizing personnel is crucial to use of categories e.g., attacker–attacked. Of course, first, second . . . Sometimes announcing is done in what is clearly seen as reverse order; though determining is done in proper order; announcing for 'suspense.'

3   The notion 'impersonal' is used as a term which is, it seems, not only one of some collection, perhaps the following: (personal, impersonal), but where the set is evaluationally ordered and has a given sense for the objects it applies to which are also evaluational. To be impersonal is not good; it requires an account.

Furthermore the activity characterized by the term impersonal is not good. The latter fact is quite important, for it informs us on the state of a kind of battle. There are proper referents of 'impersonal' such that subscription to a

moral order involves not only giving an account for what it is one does impersonally, but also that certain things are to be seen as done personally is not to provide that thereby no account is required, but to indicate that one is not, in some important ways, a member. Note too; for some matters there is not an in-out group morality. Killing anyone is wrong, accountable, and may require reference to impersonality, or personality. Not just wrong when done to members.

MCD (3)

Personal (love, hate)
Impersonal – neither, business.

If a killer were personal then he would have to hate; now, to have a way of doing killing without hate requires some formulation for which hate is irrelevant; hence, business.

It is apparently possible to do things to persons for which it is irrelevant either or both that they are persons or that you are one. One does something for which in the first place emotions are involved, on your part. The fact that emotions are involved, i.e., that they are bound to activities, is, in the first instance, crucial enough; that the collection of emotions can be substituted for is another order of fact. It means that one need not, retaining the former, arrange matters so that 'hate' is held. Alternatively it means that modification need not be done so that the boundedness of the activity is modified; that one kills, sometimes out of love (euthanasia, sadism). But that the collection is irrelevant.

Now what is to be seen is that this alternative is not made for some particular activity, but is available for a great many, and not only those for which hate is otherwise appropriately the basis; but those for which love is, too. One wants to see that access of persons to 'impersonality' is restricted; to claim in some instances that one felt nothing when doing a killing is to provide the warrant for determinations of psychopathology.

The fact that such a statement has a wide scope of 'businesses' for which it is applicable and that even for the 'military' it has not been invented by this fellow, or by some one for this war, is a most criterial sort of fact. It is for one the sort of fact one might point to in desiring to warrant the claim that there is not a strong tie between a particular basis for a conflict and the fact of conflict, i.e., for treating ideologies as rationalizations.

If the scope of 'this' provides a set of objects that have some equivalence, that is one thing; but if further there is an equivalence established between the things done in those businesses that is another, quite another.

MCD (4)

The fact that the statement has the 'you' subject which here seems to involve in part that the doings concerned are doings of particular people, though not

necessarily just one of them. Now it sometimes is possible to avoid the moral issues by so arranging things that consequences are not relevantly focused on by any or by most persons involved in their production. The jet pilot may see his particular involvement whereas thousands of others whose actions make his work possible do not.

The relevance of emotions:

1 They are an account by virtue of being a cause; and as such, they can be an adequate cause and not be an adequate account. Both love and hate can fail as adequate accounts while being perfectly adequate causes.
2 They are proper causes in a different way than they are or can be proper accounts.
3 For them to be both, something more is needed than their causal state, and if something more is needed, then that which makes an adequate account can be present even if they are not.

Personal–Impersonal (1)

With regard to the issue of the personal or impersonal character of his feelings and of the need to be impersonal in one's feelings, one quite important basis for this need may be gotten at by considering first the heading to the story, 'Navy Pilot . . .' He is a navy pilot, where that he is one of some bunch is quite relevant to what it is that is to be done with, and the sense of, his answer. For the answer is properly to be seen as representative, and as such it may be relevant that he offers an answer which is not only in fact representative, but is one that others can live with.

Now being engaged in doing that sort of thing, that is, where one's answer as an account of one's action is also and at the same time a thing which can stand as a position of others who do what you do, or pose a problem for them to which they may have to come to terms, involves then a kind of responsibility in posing that question and also a kind of need to be impersonal in making the answer; impersonal in the sense of being on behalf of some unspecified set of others. A personal answer is one that might not commit the others, to which, that they feel that way is to be determined by inquiring of each of them; an answer formulated as a pilot, in that impersonality, may be one that, having that character, can be assumed to be how such as are so situated feel, where it can be assumed that they feel that way, unless someone happens to disaffiliate himself, or to offer how he feels personally, i.e., not as a pilot.

In this regard, one interesting consequence is that how it is that nobody in particular, not any of them in fact, feel, as persons may be presented, each action on behalf of all offer what it is that they take it such as they ought to be feeling. That is some of the kind of problem that is posed by reference to how you feel as a pilot and how you feel personally, where the latter may be treated as how you really feel. It is in perhaps consideration of this sort of matter that one can most readily come to see how it is that small samples can

work out, i.e., that asking one or two gets what one would get were one to ask many, where one asks of them to answer in the guise of their status as a member of a category of which there are both many and each a representative. To get their 'personal' feeling is to get them to formulate matters via quite different structures, e.g. family stuff. Cf. Chessman.

Personal-Impersonal (2)

In our first point we say that he takes it that there is an alternative to 'impersonal.' What is our warrant for such an assertion?

1 I say that he takes it that there are alternatives and that impersonal is not therefore all that is available, not simply by virtue of the assertion that if impersonal is seen as part of a device then there are other devices than the one it is a part of, but because the device of which it is a part or seems to be a part contains at least another category, and that other is an alternative category – that is, personal. Impersonal as a member of the device is clearly an alternative to that other. (That he knows other devices is evident from, e.g., his reference to a 'wife;' where he might refer to himself when flying, or otherwise, as 'husband'.)

> His wife, Sue, lives in San Diego with their two children. "If you are a career Navy man, you have to have a career-type wife and I'm fortunate in having one," the Commander said.

2 It is also the case that he uses 'have to' in a restricted necessity sense, which excludes the use of, but not the presence of alternatives. He does so clearly in another part of his remarks, and may then be doing so in this part. That is, he does so when referring to the professional-type wife, where that is asserted via 'have to have,' and it is added that he is 'fortunate to have one,' indicating that one might have to have and yet not have.

3 Furthermore our proposal that 'personal' is an alternative and that therefore he employs impersonal as an alternative, is warranted by the negative precedent to the impersonal statement, 'I don't lose any sleep over it,' where the term used there is an idiomatic reference to a consequence of personal involvement; one that has its character as idiomatic reference by virtue of the status of 'sleep' as a personal state, and the loss of it as something which is accounted for by personal problems. One indicates that something is not affecting one, or not affecting one personally, by reference to its not having this sort of consequence where, the thing seen as personal, it would properly and expectably have such a consequence – were he to see himself as murdering people he ought to lose sleep over it.

Note: 'being killed by his bombs' (a paraphrase transform of 'being killed by your bombs') is by the pilot transformed explicitly into 'I might be killing anybody;' he does not retain the format as, e.g., 'my bombs might be killing anybody.' While there are ways that that might be

preferable and permit a formulation of matters that could be pleasant, there are strong purposes for which the transformation is crucial and the proper use – the alternative being polite or an offered out which is rejectable or not accepted – and that is, for purposes of scoring his successes, how many planes he's shot down, railroad cars destroyed, and the like. For these uses then 'his bombs' are 'him.' Whether it might be possible to set up a situation where it was he that destroyed the military target and his bombs that killed others is something that might be considered; whether if one chooses to formulate the former one must accept the latter as well by some consistency notion is another issue, related, whose scope of operation needs be considered.

An Answer to a Question (1)

Having offered in the draft paper on 'everyone has to lie' an analysis directed to showing how it is that a statement a member makes might be said to be true, we might consider a kind of parallel analysis; we might engage in attempting to determine, considering the pilot interview excerpt we are focussing on, how it is that his remarks might be said to be an answer to the question he is addressed. What is it that we have to construct so as to provide that he has done an answer, if we can so construct an apparatus? We might consider the matter noticing that narrowly, or for coding purposes anyway, it might not seem that he has given an answer; having been asked how he feels about possibly killing somebody or anybody he replies that he doesn't like it but puts his main, or more extended emphasis on how he feels about being shot at, and how he can excuse his attackers. The latter part of his remarks are clearly relevant to whether he has a complete answer, or a possibly adequate one, and in examining them we might come up with matters relevant to what it is that an answer, or saying that there has been an answer, involves.

An Answer to a Question (2)

In regard to the issue of how his remarks might be an answer, the first thing we might consider is how it is that the utterance it is directed to is a question, and what sort of a question it is.

1 As a question it is clearly one that is highly informed; it is posed by one who has a rather considerable store of knowledge about relevant matters.
2 It is also an overtly sympathetic question; by that we mean to point to the sorts of considerations it imputes to the pilot, considerations which the pilot has not asserted he has, and which the reporter in any event would not know definitively that he has, e.g., that he aims carefully only at military targets. The considerations are of course imputable by reference to what it is the pilot ought to be doing, i.e., the regulations under which he properly

proceeds. Thus we say that there is an informed basis to the question since the regulations that properly govern the pilot are employed in forming the question he has been asked.

3   However there is a way in which it might not be what it is overtly, i.e., sympathetic, for it proceeds, those things aside, nevertheless you are doing killing of persons who might not be considered as military targets aren't you, and how do you deal with that. Whereas had it been less overtly sympathetic, i.e., had asked how do you feel about killing people with your bombs, an answer might have been made that I try very hard not to kill people but to bomb only military targets; then it would be necessary to amend the first question in making another, and the fact that the position was overtly hostile might be used to doubt the seriousness of the question. Its possible sympathetic character is then of equivocal import.

4   The question furthermore is informed in a deeper way; it seems to indicate and is seen as indicating in its very formulation that the fellow being asked does not like this fact that he may be, is, killing people, it is indicating this by setting the possibility up by reference to the care that would in the first instance be taken not to have that consequence more than is necessary, or than chance would require. That is, were it not the case that the questioner took it that the fellow did not like or would not like the killing he needn't have set up the conditions as 'even with all the care he took not to.' The latter phrase does not merely propose the questioner's attitude, but proposes that the questioner knows the basic attitude and its consequences for the answerer, and that he accepts these.

Thus again the sympathetic character of the question is presented. Where that is sympathetic in that the question is taking it that what properly ought to be felt is felt by this fellow, rather than requiring of him that he assert what he properly feels, or that what is proper is something that is a question which we shall see if he knows the answer to. In this way of course there is some informing to the answerer of the sorts of things he might in part deal with in the question; not only what attitude he ought to express, but what he need not say, that information being contained in the question, where both parts will presumably be available to those who encounter the answer, i.e., in the newspaper report; where in that environment the question and answer will together contain the information that the reader will get, i.e., that it is so that he aims carefully at military targets, and that he does so by virtue in part of the fact that he doesn't like to kill people. The question could have proceeded, 'as a professional you really don't mind killing people do you?' or, 'as a professional do you have any attitude at all towards killing people?' and the like. He is not that sort of professional the question suggests, and the answer acknowledges.

An Answer to a Question (3)

It is perhaps overly weak to just suggest that the question may be formulated

in a rather sympathetic way; in such a way as to perhaps suggest or to suppose that there is indeed an adequate answer to a question that might seem to lack one. That is, it is a question which is perhaps not so much torturing the answerer as to how to find an answer to it, it being something he has to grapple with, but the sort of question to which a good answer may not be known by outsiders, the public, and which is asked so as to give them a good answer, or to indicate that the soldiers have indeed dealt with it and answered it.

In a stronger way, then, perhaps it is the case that the very asking of the question, or at least the reporting of its having been asked and answered, is done by virtue of the fact that a good answer's existence is known to the questioner, but it is useful that the answer be something that the ones most closely involved are seen to have; then it gets the character not of just a good answer but of one that is operative fact. (There could be good answers which would not be operative were they not known and used by those who were specially relevant.)

This fact that if a question could be quite embarrassing to have to answer, then someone sympathetic or someone fearful would not ask it were they not in some way assured that a good answer could be made is of course quite an old observation. The reader may be referred to Strauss' discussion early in *On Tyranny*, which I shall insert in any event in a while.[6] The fact, then, that the question is asked at all or reported to have been asked may be quite relevant to guessing the sort of answer that is offered, i.e., that it is something that the asker takes as adequate, and takes the other to take as adequate.

(The following from Thucydides, book one)

For in these early times, as communication by sea became easier, so piracy became a common profession both among the Hellenes and among the Barbarians who lived on the coast and in the islands . . . At this time such a profession, so far from being regarded as disgraceful, was considered quite honourable. It is an attitude that can be illustrated even today by some of the inhabitants of the mainland among whom successful piracy is regarded as something to be proud of; and in the old poets, too, we find that the regular question always asked of those who arrive by sea is "Are you pirates?" It is never assumed either that those who were so questioned would shrink from admitting the fact, or that those who were interested in finding out the fact would reproach them with it.

'But I don't lose any sleep over it'

The item selected and reported on here idiomatically – the sentence is an idiom – is worth some attention:

[6] See pp. 221–2.

1   It is heard and is presumably produced as a representative item. We do not take it that having heard him say that, what we ought to do or what the interviewer ought to do is to probe on further matters from the collection of which 'sleep' is a member – to ask, e.g., has your appetite suffered over it? The item, then, seems to serve as a means of indicating that on the various items of the class of which this one is a member, there are no consequences of the thing that is being considered as one that might have such consequences.

2   The relevance of the representative item is furthermore clear; that he doesn't lose any sleep over it means that it is not having personal consequences of a negative sort for him. He needn't interpret his answer.

It may be noted that the understandability of this import of his not losing sleep doesn't depend on any intimate knowledge of his sleep patterns, of, e.g., whether effects on his sleep are the usual way that troublesome actions of his show up, or whether there is perhaps some better indicator for him – perhaps he never loses sleep over anything, but he breaks out in a rash. The use of the item as representative for him, is effective, then, by virtue of the fact that it is an item which, unless otherwise specified, is representative for anyone, and in the same way, i.e., as a negative indicator.

3   Furthermore, just as it is the case that it is apparently quite understandable to the interviewer what status the item has for this fellow whom he barely knows, so, too, is it the case that the interviewer can take it that the fellow is, unless otherwise specified, an authority on the causes of his losses of sleep. This matter, that he would know why he has lost sleep if he had, is of equal relevance to the preceding ones.

4   The idiom is of some interest in a way similar to the other one he uses – 'you have to be impersonal in this business,' where 'it' seems to have a similar character to 'this;' the idiom is pre-constructed for some class of matters to which it may apply, where it is not just that sleep is representative of the way that personal consequences take effect, but that each of the items of the class that we have personal consequences, may be expected to have their consequence via the representative personal consequences. It is not then the case that some items that have personal consequences have one sort of representative effect, and others others, or even if it is, the representative items can be employed to present the fact of an effect or its lack. One knows, that is, that if an item is one that may have personal consequences, even though one has not done the thing before, what sorts of personal consequences one should look to, to see whether it is having those effects.

This is quite crucial; for it involves, then, the fact that one can be monitoring for the consequences of matters that one has not encountered; and even then, if one does not know what is causing them, one can know that something is wrong, there is some unknown cause, by virtue of the fact that some things are happening which are properly formulated as 'consequences' of some personal trouble. Thus a search procedure may be set up to find the item. And a decision may be made that it is this or that, or not. In this way, the fact that one starts with a limited set of personal consequences, or things

that are properly seen as such, means that the set of things that can cause them need only be known as to its name and need not have each item in the first instance known.

[*Written in:*] I have often talked of items as 'representative members' of classes. With the above you can get a very clear idea of what is involved in that.

The fact that he is an authority on what the sorts of things are which cause him to lose sleep, and in a strong way that he can isolate that thing which on some occasion has caused him to lose sleep is obviously quite a fundamental fact. But it must be considered in another light as well; and that is that interviewer whom it might be said barely knows him, also knows what sort of thing might do this, and is in some position to decide whether the given item would do it. Now those two facts are terribly relevant to each other. If we were to say that the fact that he is an authority, and furthermore ought to be an authority, on what it is that causes him to lose sleep, is a partial answer to the question, or a partial criterion of 'knowing oneself,' then we can see the sort of thing that that maxim meant for the Greeks. Knowing thyself does not mean knowing something very private, it means knowing oneself as a member of a community, knowing, that is, the things that obtain for one, which obtain for persons commonly. Heraclitus' fragments and Socrates' certainly had such an intention; and they did not involve knowing something about one which was distinctive, or special, or private.

The moral order provides one with the things not only which properly affect, control one's behavior, but with the materials in terms of which one can come to know oneself, and in doing so, know anyone else, and in doing so, be accessible to others. Thence, the hopes that may be attached to the phrase, or the program, 'know thyself.'

An excerpt from On Tyranny *can be found in volume 2 of Sacks' Research Notes (pp. 757–8). It does not, however, seem to bear on the issue of sympathetic questions vis-á-vis the availability of a good answer. Rather it in part seems to bear on the issue of 'tearing down', considered in lecture 12 (p. 200):*

On Tyranny by Leo Strauss (New York, 1948), pp. 18–19.

To express this more generally, Simonides knew that Hiero was not a perfect ruler. He decided to teach him how to rule well as a tyrant. More specifically, he considered it advisable to warn him against certain grave mistakes. But, to say nothing of common politeness, no one wishes to rebuke, or to speak against, a tyrant in his presence. Simonides had, then, by the least offensive means to reduce the tyrant to a mood in which the latter would be pleased to listen attentively to, and even to ask for, the poet's advice. He had at the same time, or by the same action, to convince Hiero of his competence to give sound advice to a tyrant.

Before Simonides can teach Hiero how to rule as a tyrant, he has to make him aware, or to remind him, of the difficulties with which he is

beset and which he cannot overcome, of the shortcomings of his rule, and indeed of his whole life. To be made aware by someone else of one's own shortcomings means, for most people, to be humbled by the censor. Simonides has to humble the tyrant; he has to reduce him to a condition of inferiority; or, to describe Simonides' intention in the light of the aim apparently achieved by him, he has to dishearten the tyrant. Moreover, if he intends to use Hiero's recognition of his shortcomings as the starting point for his teaching, he has to induce Hiero expressly to grant all the relevant unpleasant facts about his life. The least he can do, in order to avoid unncessary offense, is to talk, not about Hiero's life, but about a more general, a less offensive, subject. To begin with, we shall assume that when starting a conversation with Hiero about the relative desirability of the life of the tyrant and private life, he is guided by the intention to dishearten the tyrant by a comparison of the life of the tyrant, and therewith of Hiero's own life, with private life.

To reach this immediate aim in the least offensive manner, Simonides has to create a situation in which, not he, but the tyrant himself, explains the shortcomings of his life, or of tyrannical life in general, and a situation in which, moreover, the tyrant does this normally unpleasant work, not only spontaneously, but even gladly. The artifice by means of which Simonides brings about this result consists in his giving to Hiero an opportunity of vindicating his superiority while demonstrating his inferiority. He starts the conversation by presenting himself explicitly as a man who has to learn from Hiero, or who is, in a certain respect, less wise than Hiero, or by assuming the role of the pupil. Thereafter, he makes himself the spokesman of the opinion that tyrannical life is more desirable than private life; i.e., of the crude opinion about tyranny which is characteristic of the unwise, of the multitude, or the vulgar. He thus presents himself tacitly, and therefore all the more effectively, as a man who is absolutely less wise than Hiero. He thus tempts Hiero to assume the role of the teacher. He succeeds in seducing him into refuting the vulgar opinion, and thus into proving that tyrannical life, and hence his own life, is extremely unhappy. Hiero vindicates his superiority by winning his argument, which as far as its content is concerned, would be merely depressing for him: by proving that he is extremely unhappy, he proves that he is wiser than the wise Simonides. Yet his victory is his defeat. By appealing to the tyrant's interest in superiority, or desire for victory, Simonides brings about the tyrant's spontaneous and almost joyful recognition of all the shortcomings of his life and therewith a situation in which the offering of advice is the act, not of an awkward schoolmaster, but of a humane poet. And besides, in the moment that Hiero becomes aware of his having walked straight into the trap which Simonides had so ingeniously and so charmingly set for him, he will be more convinced that ever of Simonides' wisdom.

Appendix A
"The baby cried"
[Notes for lecture 1]

The materials to be discussed: The story fragment "The baby cried. The mommy picked it up." *CTS* p. 35[1]

Plan

1 I will first make some observations about the segment
2 Then I will embark on the building of an apparatus for its analysis:
    a   That will first involve a consideration of what the apparatus ought to do.
    b   Then the apparatus itself
3 Upshot of the constructed apparatus
4 A consideration of the possible fact that the segment is from a 'story:' How is it a 'story;' criteria for identification
5 Some further general considerations.

1 Observations

    a   While this is a piece of talk, we would in the first instance feel assured in saying that there are two sentences here: S1, S2. Let us note that there are also two actions, A1, A2, and we hear the story as providing that S1 reports A1, and S2 reports A2. Thus we hear A2 as following A1. Now this cannot be accounted for simply by the fact that S1 precedes S2:

    a.1   For, for one, S1 is composed of three words, and we do not hear the things those words name as following each other in the same way, though w3 follows w2, which follows w1.

---

[1] *CTS* is the book *Children Tell Stories.*

These are the original Sacks materials, with a few changes. For example, the book *Children Tell Stories* is sometimes cited – as *CTS* – but sometimes only the page number is given. There, the notation *CTS* is added. Or, for example, whereas elsewhere corrected errors have been preserved (e.g., Spring 1971, May 21), here only the corrected version is shown. For example, in "Let us note that if there are also two actions, A1, A2, we hear the story as . . ." the "if" is crossed out and an "and" is inserted after "A2." In the edited version it is shown as "Let us note that there are also two actions, A1, A2, and we hear the story as . . ." And references to the literature have been revised.

a.2   Also, it is perfectly obvious that we can find elsewhere two sentences linked as these are, with nothing between, where we would not hear such an action sequence. For example, "The piggie got hit by the choo-choo. He got a little hurt. He broke his neck. He broke his chin." *CTS* p .30.

a.3   Furthermore a connective which particularly does the relating of reported occurrences, 'then' – "This Indian caught this Indian. Then he tumbled" – is not used, and seemingly is not missed.

Thus, it is indeed a problem how the relation between s1, s2 as one of the latter following the former provides information about the relation of a1, a2. How is it done?

When we develop the apparatus for analyzing the sentences some help may be gotten on the question for the particular (sorts of) reported occurrences; here some fairly general considerations.

We said initially there were *two sentences*. The determination that there are two sentences must be made by reference to this fragment as talk, and not via a consideration of the fact that the grammatical marker, a period, stands between them. The child did not dictate, but told, and the child probably doesn't read or write, so the use of the period is not a resource for it. The receiver of the stories might for one be wrong in putting the period where she did, and we shall see that at other points there is good reason to suppose that she is wrong in her transcriptions. But these facts are somewhat secondary to the question of what is it that would give us grounds for saying that something is or is not a sentence. Let us consider the relevance of our observation (a); to wit, that we hear what we have called s1, as a unit in the sense that we do not take it as relevant that it comes out in a sequence of words, i.e., we hear it as a unit and not as a left-to-right string. We hear s2 in the same way; and this is most clear since we do hear the relation between s1, s2 as one of left to right.

If the way the piece is heard is related to the way it is generated, that s1 is generated in some way, then the speaker begins again and generates s2, where the sequential relationship is of relevance between but not within the units. Other considerations are relevant within the units. That, or something like that, could be a criterion for saying there are two units – sentences. We leave aside for the moment the possible importance of the possible fact that there is some strong relation between the production unit and the detection unit. On the latter I refer you to Hockett's paper, 'Grammar for the hearer', in Roman Jakobson (ed.), *Structure of Language and its Mathematical Aspects*, vol. 12, *Proceedings of Symposia in Applied Mathematics* (Providence: American Mathematical Society, 1961), 220–36. We will come back to this sort of convergence problem, though probably not this particular one.

If there are heard, and are generated, two internally structured units, then the possibility of S1 being relevantly followed by S2 would be provided for, though the relevance of that, i.e., as providing a resource for indicating and

detecting the relation between the actions reported in each, would (not)[2] of course be necessary. Note: 'then' could serve to do the job if a single sentence were used; 'and' alone might be quite ambiguous.

a   Caveat or a query on what implication there seems to be, if we hear a sequence of A1, A2 provided for in part by S1, S2 about the temporality of the sequence – how soon after?

b   Both the word 'baby' and the word 'mommy' are adequate ways of referring to persons. A single category can be referentially adequate (economy rule).[3]

c   Quite apart from the particular actions reported, 'baby' and 'mommy' are related categories. They are both categories from the same collection of categories, a collection consisting of such as (mommy, daddy, baby, etcetera). This collection consists of a group of categories where:

One important way the group or collection of categories is employed is to provide a unit which, for the domain of relevance of the collection, locates a set of persons organized by reference to a case of the unit, where the unit is duplicatively operative across the community of culture users, such that the possessive pronouns locate a set of persons ensconced in particular cases.

Not every collection of categories is so organized; teams are, but of the collection race; for that one, if there is some organization of Members, persons, then it is regularly vis-à-vis incumbency in the same category.

The character of the collection's organization is most simply evident in the fact that when we hear the two sentences we take it that ('we,' i.e., members of the community of culture users), when Members hear, they take it that it that it is not some baby and some mommy who are involved, but the baby of the mommy, and the mommy of the baby. Such a relation is not heard in such a sequence as: "The next one who wakes up is the mailman. The next one who wakes up is the doctor. "*CTS* p. 71. Note however, re the passing reference to teams: "They rode on a choo-choo train. They went to a railroad station. The conductor jumped out and said, "All aboard.' And he went in and the conductor was Mr Conductor and the engineer was Mr Engineer and the fireman was Mr Fireman." *CTS* p. 42, cf. further. Cf. p. 71 the three mentioned after 'doctor' are not initially ensconced in a single train, but it may well be that they are heard as related.

c.1   The consistency rule: Note an immediate use of it. 'baby' is not only a category of the collection noted above; it is a category of the collection 'Stage of life' (baby, child, adult, etc.). Given the two sentences it is, however, heard as a member of the collection 'family.'

Perhaps: If a category is a member of alternative collections, it is heard, when used, as a member of that collection which the consistency rule locates – thus the ambiguity problem may be resolvable if at least two categories are used. Cf. p. 71, 'fireman' is an ambiguous occupational term – there is a guy on trains, and a guy who deals with fires. The reference is clear by reference

---

[2] The original is unclear.
[3] The words '(economy rule)' are handwritten.

to the preceding categories being train personnel. This is even more apparent in the quotation, p. 4, from p. 45.[4]

c.2   Note then the character of the consistency rule; on the one hand it is used to generate the terms, given a first, and on the other it is used to detect the relation of the generated terms. Cf. remarks in a. above. These parallels shall turn out to be deeply important. A culture is an apparatus for generating *recognizable* actions; if the same procedures are used for generating as for detecting, that is perhaps as simple a solution to the problem of recognizability as is formulatable.

d   For the given actions reported, the particular pair of person references used are peculiarly relevant; that is, even sticking within the collection from which they are chosen, they are particularly relevant. I will consider this fact in the discussion of the apparatus.

e   The use of 'it' for reference to the baby. Why is it that 'it' is used; note that it is used elsewhere in the stories when that reference – to 'baby' – is made. Relevance of boy – 'he,' girl – 'she,' baby –?

Also, and much more importantly, the occurrence of the pronoun 'it' means that at least to some extent the collection – pronouns – is available to the kid. That means right off that two collections are held; they are, we shall propose, quite different sorts of collections.

In modification of the discussion in 'The search for help,' I want to propose that sticking to pn-adequate devices, we ought to divide them into two classes; class two consists of (a) pronouns, and (b) proper names, and class one of the rest. Now if it is the case that insofar as the consistency rule provides that reference once made to a category from a collection, reference to others should be made to them via categories of the same collection and not other collections, then that rule only holds as between categories of class one. That is, class two categories may be used in combination with class one categories. The case at hand evidences this, and many others.

The following quote is from Weir, pp. 73-4. *RH*

> *Pronouns.*Analyses of standard English pronouns vary in their interpretations of the various pronominal forms as variants of a single morpheme, or as separate morphemes. This problem is not at issue here since we are primarily interested in the forms which occur, and in how well they are established. Of the personal pronouns, the form *it* has by far the widest occurrence (over one hundred) and is firmly established in the child's speech pattern. Occasionally it is over-used as a substitute for a plural noun at the expense of *them*. The frequent use of *it* confirms the child's classification of nouns into personalized and non-personalized classes as was pointed out. The non-personalized nouns permit substitution by the pronoun *it* rather frequently, whereas the personalized nouns (including names of persons, favorite toys, and animals) rarely are substituted for by pronouns.

[4] On the original p. 4, a quotation is shown from 'p. 42.' (See p. 225.)

In speaking of himself, the child uses *Anthony* much more frequently than *I*, the use of which is restricted to special situations. The instances where *I* does occur are either instances of complete quotations from adult speech, like *I don't hear you* where the use of *do* in a negative indicative sentence also points to a non-internalized structural pattern; or *I* occurs in the child's attempts at adult speech as apparent from the context surrounding the sentence, e.g., *Door. I'm fixing the door. Door's open*; or *I* appears when the rest of the sentence contains no particularly bothersome structural consideration for the child, as in *I have a blanket like a lipstick* where *blanket like a lipstick* is one of the child's 'set' expressions as it were. However, the pronoun is also consciously practiced as the two consecutive sentences show; *I'm taking the yellow blanket, I gave the yellow blanket*.

Of about the same order of frequency is *you*, also about twenty-five times, and its usage shows similarily to that of *I*. They are also practiced together, for example, in this question–answer interchange: *Where are you going. I am going*. The other personal pronouns occurring are *she*, *her*, *he*, *him*, *me*, *we*, and *them*, all with a frequency ranging from one to fewer than ten occurrences. All these pronouns appear in the correct syntactic slots as compared to standard English, but the category of gender has not yet been learned, similar to the case of possessive adjectives. There is one occurrence of *himself* in the corpus, and we have no additional information on the reflexive paradigm except perhaps for the sentence, *I told me*, conspicuous by the non-use of the reflexive. It is certainly not surprising to find pronominal substitution with the child's class of personalized pronouns so poorly learned in that it involves viewing the speech event not only from the point of view of the addresser and addressee, but also from the point of view of the person or thing being discussed.

f   Having made an observation about 'it,' one about 'the' is apposite; consider the use of 'the mommy.' Quine, most particularly in *Word and Object*, sec. 19, proposes: 'A singular term, e.g., "mama," admits only the singular grammatical form and no article.' intendedly referring to 'our perfected adult usage' (p. 90). Now if it is the case that Quine is correct for adults, it is quite apparent – we can find many more occurrences than just the piece at hand – that children behave differently. Is there some special explanation for this? We would of course, in doing this, have to come to some discussion of his notion of 'singular terms' and 'general terms' and a consideration of the relevance of these formulations. But it may well be so adults do not, and children do, use 'the mommy.' If adults don't, then perhaps children 'construct' the usage – cf. here, Brown's papers in which the 'construction' phenomenon is examined – in Lenneberg, and in Brown and Bellugi.

Possible account; for adults there is a large selection, or a fairly large selection, of devices which provide categories for handling any given person;

this permits perhaps the specialization of certain terms, such that for any given person that term may only get used for some proper person(s). Now children do not have such an armory. The basic device they do use is that 'family' one; they make a big leap with the addition of the pronouns. Now they use the family to do rather more extensive work than others do, and adults assist them in this – referring for example to a large bunch of men and women encountered as 'uncle '/'aunt.' The duplicative character of the family-unit set of categories is quite important for the kids; for one, in combination with the possessive pronouns it permits sorting out to go on while reference to a larger bunch of people via the same unit is made. But it does involve their use of the terms in becoming singular, as categorials; and 'mommy' gets such usages. They say: "There are two mommies and a baby" and other like things, and they do say 'the mommy.' The expansion for men (if 'mommy' is the normal expansion of women who are not my mommy or aunt – they are then 'a mommy' or 'X's mommy') involves the use of the set of occupations to handle 'other men' than daddy and the uncles – the milkman, etc., are 'men.'

It might not then be too misleading to put it that the singular term reference status of 'mama' is an adult luxury.

It might not be amiss either to notice how much is indeed handleable via the family unit.

We shall of course consider the great leap forward gotten when the pronouns are acquired. That anon.

g   In the case at hand the fact that the characters are introduced via the consistency rule's use may be claimed to be a rather trivial consequence of the possible fact that the child possesses the use of only a single class one pn-adequate device. If that were so, then of course the consistency rule would be used.

g.1   Now, however, if the child learns something which for the single device is trivially so, but which is not obviously so, and surely not trivially so when more devices are added to its repertoire, but is nonetheless proper then, too, then that is something not so trivial. So it shall be found.

g.2   Now it is also non-trivial that in using the single device, it is used duplicatively. The child is first given what turns out to be a case of a duplicative unit; and it comes to see and use the categories as duplicative; for this child in the next story we find the same device being used for 'an elephant' though in that one we do get an introduction of something apart from the device, i.e., 'milkman.' The duplication is not obviously the child could come to see, as is done elsewhere, the whole relevant world as one family.

h.   Rather more generally we want to observe what is among the most obvious of features of the fragment; it is recognizably what we may call 'a potentially correct description.' The question of what is involved in a potentially correct description, or in this being a potentially correct description, will be considered in the consideration of the apparatus. Here such matters are to be noted, as: Adequate means of referring to characters, adequate means of referring to characters' actions, adequate pairing of

character references and actions, adequate pairing of the sentences, adequate pairing of character reference terms and pairing of action terms, and of combined pairings.

2 *The apparatus*

a What it should do

1 It should generate, interestingly, this segment.
2 It should permit us to discriminate this segment as a potential description of a proper sequence of occurrences, from some segment which is an improper sequence of occurrences properly described.
3 It should exclude the production of grammatical 'non-potential description.' In this point is something of the largest importance. We are going to aim at building an apparatus which involves building constraints on what an adequate grammar will do, such that what an adequate grammar will do, some of the things it will do, we are going to rule out, and provide for the non-occurrence of.

Our apparatus ought to give us this segment as a potential correct description and as a potential correct description of a proper sequence. We shall want to get potential correct descriptions of improper sequences, by a suitable modification; and we shall want to see whether we need provide for potential incorrect descriptions.

Appendix B
"The baby cried"
[Notes for lecture 2]

Because of some problems with the room plug, lecture two did not get recorded. Furthermore it was not laid out in the notes. In this I will very briefly outline what was done; the next go round it will be recorded.

It was basically concerned with the character of "the baby cried" as a good beginning.

(1) Our first concern was to provide that, if children's rights to talk are restricted, then it is expectable that they will have some special ways of getting to talk, and these ways may involve them in having a proper way of beginning which provides them with rights to continue, and for the correctness of their having begun in the first place.

The hypothesis that they do have restricted rights to talk was established by considering the character of what, for the young ones, say three or so, use as their – not merely prototypical but at some times almost universally used beginning; the line 'You know what?' and equivalents. An analysis was made of the elegance of this line.

(2) With the establishment of the hypothesis that the analysis provided, we moved to consider other ways that they might establish a right to talk; the occurrence of troubles – where, by that we meant occurrences such that if they happen then an adult has some obligation to act, where then the occurrence of talk was directed to indicating that the adult obligation ought to be actualized.

(3) This issue of troubles was then tied to the notion of topic, i.e., things that could be said where the thing was something which was conversationally generative; on this matter, too, 'trouble' was seen to be rich; comparison, for example, of the amount of talk generatable if, to the question 'how are you' the answer is 'fine,' with the answer 'lousy.'

The relevance of a matter being a good topic was made by reference to the issue of a story being 'about' something, and thence hopefully something about which more than a little might be said, i.e., the item offered might be generative. 'Trouble,' not merely a good thing to provide grounds for talk in general in conversation, a first item, but also a first item which is generative and therefore specially attractive for stories.

These are the original Sacks materials, with a few changes. See Appendix A, note to p. 223 for details.

230

(4) This led to considerations like: It might be said, given the fact that the children's stories, especially the youngest ones, are so much about troubles that that is what their fantasy lives contain. While this might be so, I want to point out that it is not unique for children's stories, but is a large part of adult conversation, and more particularly it is the base focus of Western literature. The complaint has been made about Western literature, as about children's stories, though the two may not have been tied together, nor the richness of trouble as a topic and the poverty of normality as a topic much observed; here Tolstoy's observation: happy families are all alike; unhappy families are unhappy each in their own way; that quote not exact – first line of *Anna Karenina*. ('Unhappy' for Tolstoy readily seen to be equivalent to acting improperly – see second sentences.)

(5) Extend remarks to notion that only by behaving immorally is one doing anything; the answer to the question, 'What are you doing.' 'Nothing,' as equivalent to something proper. Sowing wild oats as building stories for one's future.

In this sort of line of analysis, then, is shown the good beginning for conversation, and then for stories, of "the baby cried;" also its generativity.

Part III
Spring 1966

Note

The Spring 1966 lectures start off with two lectures which eventually became the paper 'On the analyzability of stories by children.' In J. J. Gumperz and D. Hymes (eds), Directions in Sociolinguistics (New York; Holt, Rinehart and Winston, 1972), 325–45, reprinted in R. Turner (ed.), Ethnomethodology (Harmondsworth; Penguin, 1974).

   Two versions of each of the two lectures are included in this volume. The first of each is the unedited text of the original working transcript, prepared just after each lecture was delivered. The second of each is the unedited text of Sacks' revision. With these two versions of each of the two lectures, can be seen what Sacks took to be a next operation on a lecture. It is infinitely removed from anything an editor might do; not only far more formal, but often a matter of further development of the work at hand.

   The difference between the original and revised versions of the first two lectures, not to mention the difference between those and the published version, point up the fact that the unrevised lectures which make up the bulk of these volumes are at best informal, often rudimentary — the raw beginnings of what they had in all too few cases a chance to become.

Lecture 1

"The baby cried. The mommy picked it up"

The data is the first couple of sentences from a story in the book *Children Tell Stories*, told by a girl two years and nine months old. It's on page 35. I'll read it out to you. It says, "The baby cried. The mommy picked it up."

What I'll be trying to do for the beginning week or so is to give you some idea of the sorts of things I'll be trying to do, in what will be much greater detail, I hope, throughout the rest of the semester, once we get the materials dittoed up that I can give you, and once you get some familiarity with just a few of the ideas we're going to use.

Now let's begin off by just making some observations about those two sentences. And if you feel that what I say right now is the rankest kind of subjectivism, then just hold off your feeling that that's so, to see whether it won't be possible for what I say to be defended and used.

When I hear "The baby cried. The mommy picked it up," one of the things I hear is that the mommy who picks the baby up is the mommy of the baby. Now it's not only the case that I hear it that way – and of course there's no genitive there to say 'its mommy picked it up,' 'his mommy,' 'her mommy' – when I hear it that way a kind of interesting thing is that I also feel pretty confident that all of you, at least the natives among you, hear that also. Is it some kind of magic? One of my tasks is going to be to construct an apparatus which will provide for that fact to occur. That is, how it is that we come to hear it in that fashion. Now exactly what else that apparatus will do, we'll see.

There's another thing. I suppose we would say that there are two sentences, and of course the fact that there's a period doesn't guarantee that. The child doesn't know how to write, didn't put in a period. The person who was told this story wrote it down and wrote a period in. But I take it we hear two sentences, and we also hear the following kinds of things. Call this S1, call this S2. This reports an occurrence, O1, this one reports another occurrence, O2. Now we hear the following sorts of things. We hear that O2 follows O1 like S2 follows S1. And not only that. We also hear that O2 occurs because of O1. That is, the explanation for O2 occurring is that O1 did. And what we want out of our apparatus is that it show how we hear that, also.

What we want to do then, speaking kind of roughly right now, is to provide for how it is that something that's done is recognized for what it is,

---

Except for the title, this is the unedited text of the original transcript.

where the big thing is that some action is recognized as a something, as a case of some activity. What the something is, we'll give a name to in a bit. In this case where we can at least suppose for the moment that for some actions, anyway, that persons do, they're done in such a way as to be recognized, so that the apparatus that can provide for how they're recognizable can also constitute procedures for generating the occurrence as a recognizable action, or set of them.

Now if I asked you to explain the set of observations I made – which any of you could have made just as well, and therefore they're not proposed as findings of mine, but as we'll see, they only pose the problems that we have to come to terms with – I suppose you might say something like the following. We hear that it's the mommy of the baby because she's the one who ought to pick it up, and if she's the one who ought to pick it up and it was picked up by somebody who could be her, then it's her. And furthermore, of course, the baby ought to have been picked up, given that it's crying – or something like being picked up, soothed in some way. So what was done is just what ought to have been done.

Now let's notice something that is worthy of some thought. What we've been essentially saying so far is that the pair of sentences seem to satisfy what a member might require of some pair of sentences for them to be a description. And they're quite recognizable as at least possible descriptions without, for the particular case, inspecting what they might describe. You can tell that they describe something just by looking at them. They 'sound like a description.' And something can sound like a description. So some form of statement can have the character that it could be a description, and you don't have to look at the circumstances to say, in the first instance, that it could be a description.

What does that mean? One thing it means is that if the apparatus we construct is directed to producing recognizable descriptions, then we, as analysts, needn't come to terms in the first place with what it is that babies and mommies do to each other, to decide that it's a description. We're dealing with the fact that this thing is recognizable as such without one having to look at some circumstances it purports to talk about, or might be said to purport to talk about, and therefore there may be ways of generating 'possible descriptions' such that they are recognizable apart from anybody's inspection of the circumstances they may talk about.

How could that be possible? Let me just add here, when I talk of generating these events and building an apparatus that generates them, the name of that apparatus is, of course, a culture. At least the way I'm going to use it. Now you ought to get some sense right off – and the reason I go through the observations in the way I did is to give you some sense – of the fine power of it. It's not just producing brains that are roughly alike, but they're alike in fine detail. After all, these sentences are not the most important set of events in the world. It's a kind of very minor little thing, and yet the operation of this culture, whatever it will look like, is such that you all hear just what I said you heard, and I don't even know you. That means

we're dealing with something real and powerful. And not just grossly powerful, like it provides for the rate of industrial development, but it provides for little tiny things that God might have overlooked, perhaps.

Now let's then try to begin to get some idea about what it is we want to do. I'm going to introduce a bunch of terms that we need. You needn't write them down very carefully. You needn't write them down at all, perhaps, because most of the terms I'll introduce right now you'll find in the first ten pages of this paper I assigned you.[1]

The first term is 'membership categorization device.' I'll just talk about it most of the time as 'categorization device.' That's the basic thing I'm interested in, 'membership categorization device.' And those things are collections of categories for referring to persons, with some rules of application. So there's a collection of categories and there are rules of application, where these devices can be applied to populations and members apply them to populations to say things about them, like that that's 'a baby.' Typical collections are things like (sex: male/female), (race: white/Negro'), etc.

Now, not any set of categories are a collection. We only talk about a collection when the categories that compose it are categories that members do in fact use together or collect together, as 'male' and 'female' go together. A set could be any bunch of categories.

Now the first thing we can note about this is, 'baby' and 'mommy' are two categories from one collection, the collection you could roughly call 'family,' which consists of 'baby,' 'mommy,' 'daddy,' and a variety of other things. Now there's some rules which I'm going to use a great deal of the time. Let me say in passing, I want you to notice that the term 'collection,' having the character that it is categories-that-go-together, we could propose that some categories go together and be wrong. So it's not simply a construct of my own in the sense that if I'm going to call it a collection, I am going to say whatever it is that goes in there. The terms are constructed so as to best come to terms with what it is that people in fact do, how in fact they handle these things.

Now one very simple thing, though we have to note it, is that any single category from any of these categorization devices is adequate to refer to a person. By which I mean, for one thing, that if a person uses a single category to refer to somebody, then you don't wait for them to continue, when they said 'baby,' to give you more before you could have some idea of what in the world they're talking about. It's perfectly imaginable that you would need to have a string of these things put together so as to get some idea of the fact that it's really a person. We could imagine a world where you had to pick one category, say, from each of three collections, to characterize a person in such a way that anybody could know what you were talking about. But as it happens, one category is enough, and 'baby' and 'mommy' are enough.

Now one basic rule in the use of these things, I'll call the 'consistency rule.'

[1] Probably a draft of 'An initial investigation of the usability of conversational data for doing sociology,' now in D. N. Sudnow (ed.), *Studies in Social Interaction* (New York: Macmillan, The Free Press, 1972), 31–74.

It holds that if you are categorizing some population of persons – if a Member is categorizing some population of persons – then if they've used one category from some collection for the first person they're going to categorize, they may – it is legitimate, permissable – to categorize the rest of the population by the use of the same or other categories of the same collection. Now that can be done with some of the devices. Some of the devices are so constructed that they can categorize any population, like 'sex' can categorize any population, however large, with its two categories: Male, female, male, female, female, male, female, etc., etc. Some collections can't do that, and for them, if you don't know what kind of population you have, it may well be that you cannot use any given device to categorize them. We'll get at the properties of these various devices as we go along.

So the consistency rule says right off that if the first term is 'baby,' then further persons may be referred to by such other categories as 'mommy,' 'daddy,' and the like, i.e., it will tell us that if a population is being categorized by persons, then, for one, the categories that they use will not be a random set, but if we have a first, we can lock in on those that they will in fact use for handling the rest. And if you look through the stories you'll find that that's so, and if you listen to people you'll find that that's so.

Now I said 'may.' That's a weak version of the consistency rule. A strong version, which sometimes holds, says 'must.' Where it holds, we'll consider as we get along. That is, it says if some person has been categorized by some category of some collection, then the rest of that population has to be categorized by the same collection of categories.

Now I want to show you how we can now already get some kind of interesting things to see. 'Baby' happens to be an ambiguous term under one way I'm going to formulate 'ambiguous' – and it's not an ambiguous way to formulate it. That is, 'baby' is a term that occurs in at least two different collections. For one, it occurs in the collection which you could call 'stage of life' if you like: 'Baby,' 'child,' 'teenager,' 'adult,' whatever categories are in it, and also it occurs in this collection we call 'family.' Now the fact is that you don't hear it as ambiguous. You don't hear it as being 'a very young child cried, the mommy picked it up.' What you hear is 'The baby of the mommy cried, the mommy of the baby picked it up.' Why? Well, what happens is the consistency rule is not simply a rule that a categorizer uses to categorize populations. It also can apparently be used as a maxim for hearers. Don't forget, we're dealing with recognizability, constantly. And as a maxim for hearers, what it can do is to say the following. If there are two categories used, which can be found to be part of the same collection, hear them as part of the same collection – which is the way you hear them. Now you might, if you like, recognizing that in fact 'baby' is ambiguous in just the way I've said, construct an explanation for yourself of why it is that you don't hear it as 'baby' from the 'stage of life' collection. This ambiguity, of course, can be a matter that you can play with. So a mother will say, 'You may be 40 years old, but you're still my baby.' And it's not a queer usage, to use 'baby' in that way.

Okay. So the consistency rule will then give us, given the first term, the second – or some set of alternatives of which the actual second is one – from a very delimited set. Now let's consider this particular collection, 'family.' It's one of the series of collections which you can think of by the more prototypical name of them, which is 'teams,' which have as one of their central properties that they are what I'm going to call 'duplicatively organized,' by which I mean the following. When they're used on a population, what you do is you take the set of categories of the collection, treat the set of categories as a unit, and put people into cases of that unit, where what you don't get is seven daddies, six babies, three mommies, etc., but you get sets of people who are organized into more or less complete units. So you end up with whole families, families without fathers, families without babies, etc., and not an enumeration of categories of persons. And if you counted that population, you would very likely count it in terms of the number of families, and not the number of mommies, daddies, babies, etc.

Now, when you have a collection that has this duplicative organization to it, then it seems to be the case that if we give a list of terms in which categories are used from such a collection, whichever one it may be, and we give the terms various predicates, i.e., those people are doing various things. The third baseman got up and scratched himself. The second baseman sat down, etc. The engineer looked out the window. The conductor took a ticket. For each of them, by virtue of the duplicational organization and the way it operates on you, you hear, if you can – that is, if there's not some reason why you can't, you always hear them as belonging to the same case of that unit. That is to say, in just the way that you hear 'that baby of the mommy,' if I had a string: The second baseman, third baseman, etc., you hear that as being 'the second baseman on the same team as the third baseman.' And if you look at some of the stories in which the kids will go through a string of titles – like one of them has train jobs – you hear them as the same train. That then gives us at least in part how it is that we hear 'the baby' and 'the mommy of the baby.'

Now notice that it gives us this in a way that does not now at this point depend on our feelings, and that in giving us this it also gives us a whole bunch of things which are not in any obvious way just the same sorts of objects. That is to say, first baseman, second baseman, pitcher, do not have, except in some interesting way, a familial relationship to 'family,' and we can lay out quite objectively what it is that routinely stands as the criterion for deciding that something is duplicatively organized. If it is, then we can say how it is that it's going to be heard, and then of course, how it is that one may speak so as to have it heard that way. For some things, for example, if I say "The doctor got up, the engineer got up," then if I'm going to try to suggest that that engineer who happened to get up was the engineer of the doctor, I have to tell you by using a genitive, for example. So these sets of rules, then, are operating not only to provide for how this thing is *done*, but they're usable in various ways to provide for how it's recognized.

Now one of the things you have to see is that what we're talking about now, at least the results and the phenomena, are not phenomena that you

have to take my word for. It's something that you can see. It's stuff that occurs. When you hear somebody do one of these things, listen to how you hear it. Now the question of whether the account is adequate is another kind of question. That doesn't yet give us how we hear this thing to be a 'description.' More is needed for that.

Let's introduce a term, which I'm going to call 'category-bound activities.' What I mean by that is, there are a great many activities which Members take it are done by some particular category of persons, or several categories of persons, where the categories are categories from these membership categorization devices. Now how we would tell that they're 'bound' is something that I will give you as many different ways as we can use to tell, as I can. But let's consider, let's say, one. I want to propose, as it's obvious enough to you, you wouldn't argue with the issue, that 'cry' is bound to 'baby.' But we could still of course ask, well, how would we decide if that's so?

Now I'm going to propose that it's bound to the other sense of 'baby;' that is to say, 'baby' in 'stage of life,' since in this case 'baby' in 'stage of life' is just as well probably 'baby' for purposes of 'family.' Okay. Now the 'stage of life' categories are positioned: 'baby' . . . 'adult', with whatever in between. Let's see if we can describe a procedure for denigrating somebody, or for praising them, the operation of which consists of the use of the fact that some activities are category-bound. It would seem to be the case that if an activity is category-bound, and it's bound to some category that is in a positioned collection, that given simply the positions and not necessarily the categories themselves – perhaps it could work for any device which has that feature of positions – the way we construct the denigration of somebody is to propose about them that they are doing something that is bound to some category that has a lower position than theirs. And alternatively, the way to praise them is to propose that they're doing some activity which is bound to a higher category than theirs. And alternatively, you can simply say about them 'You're behaving like a . . . ,' whatever the alternative position is. So if an adult cries he can be said to be 'behaving like a baby' as a way of denigrating him; if a baby does something about which babies are expected to cry and he doesn't, then you say 'You're behaving like a big boy.' And we can pull these things out and think of such things as 'nigger work,' for example – whatever positional situations you want – as simply formal means which are tied to positions for paising or degrading – which I introduced only to show that that would be a means of seeing that a particular activity was in fact bound to some category.

Now notice, that very thing will show us also that these collections are real, in that what will be contrasted will be two positions from what we have proposed to be a given collection. If an adult cries, somebody is not going to say "You're acting like a janitor." They'll say, "You're acting like a baby" – or, if it's a male, " . . . like a woman." And again, this can be quite formally analyzed because all you're going to have to do is assign letters and numbers to the positions, and say could we not generate a way of degrading somebody by picking some of the activities bound to one of the categories in this position

and using them as ways of characterizing persons who are recognizably members of another. Try it and see. Though of course you already know it in other ways.

Okay. So 'crying' is bound to 'baby.' The simplest way you make a recognizable description is to take some category and some activity that's bound to it, and put them together. That sounds absolutely trivial. If you take an activity that's not bound to a given category and assert that it happens, or assert it, people are perfectly willing to argue, to say 'No.' 'No,' even in the case that we are just dealing with, a story. It's not believable. If you read literary criticism, people say about novels, "The characters are unbelievable." The whole possibility of, at least 19th-century, early 20th century literature turns on the fact that descriptions are recognizably correct – interesting, exciting, but recognizable apart from having to look at whatever it is that is being characterized – if anything is being characterized – and that by playing with the sets of properties and their relationships, one can in fact construct cogent remarks about something. The fact that it is that kind of formal operation is what would lend credence to the fear that, of course, computers could build novels.

Lecture 1 (R)

(first revised draft, February 20, 1966)

"The baby cried. The mommy picked it up"

In the first three lectures I intend, first, to present and employ several of the more basic concepts and techniques which I shall be employing throughout the rest of this course. Since most of those I shall use at this point may also be found in the paper which is appended to these lectures,[1] these first may be seen as reintroducing and extending the results developed there.

Second, I shall focus on the activity 'doing describing' and the correlative activity 'recognizing a description,' activities which Members may be said to do, and which therefore are phenomena which sociologists and anthropologists must aim to be able to describe. It will initially be by reference to an examination of instances of Members' describings that my attempt to show how sociologists might solve their own problem of constructing descriptions will be developed.

Third, and relatedly, I shall consider the problem of 'correctness' in a manner parallel to the format that will be used to deal with 'describing.' I shall examine a rather abstract statement which Members make and which may be said to be correct, and in formulating how sociologists might proceed to develop its correctness, a sketch of what correct sociological description might look like will be exhibited.

Fourth, the analyses will permit us to redevelop the critique of current social science that was first developed in the appended paper, to indicate again its scope and the constraints it imposes on a sociology or an anthropology that is not to suffer from the equivocality that preceding researches have suffered from.

Proceeding in the fashion I have proposed will require both some exceptional delicacy on my own part and on that of the reader. I proceed in this way not only because it satisfies my own aesthetic but also because it will permit a clear focus on several central, and neglected issues which social science must face, most particularly, the problem of Members' knowledge and the problem of relevance. Let us then begin.

The initial data is the first two sentences from a 'story' offered by a two year and nine months old girl to the author of the book *Children Tell Stories*. It

---

[1] Probably a draft of 'an initial investigation of the usability of conversational data for doing sociology,' now in D. N. Sudnow (ed.), *Studies in Social Interaction* (New York: Macmillan, The Free Press, 1972), 31–74.

goes: "The baby cried. The mommy picked it up." I shall first make several observations about these two sentences. Before doing so, however, let me note: If these observations strike you as a ranker sort of subjectivism, then I ask you merely to read through just this first lecture to see whether it is or not the case that the observations are both relevant and defensible.

When I hear, "The baby cried. The mommy picked it up," one thing I hear is that the mommy who picks the baby up is the mommy of the baby. That is a first observation. (You will, of course, notice that the second sentence lacks a genitive. It does not read, "Its mommy picked it up," or variants thereof.)

Now it is not only that *I* hear that the mommy is the mommy of the baby, but I feel rather confident that at least many of the natives among you hear that also. That is a second observation.

Is it some kind of magic?

One of my tasks is going to be to construct an apparatus which will provide for the foregoing facts to have occurred; an apparatus, that is, which will show how it is that we come to hear the fragment as we do.

Some more: I take it we hear two sentences. Call the first S1, and the second S2; the first reports an occurrence, O1, and the second reports an occurrence, O2. Now, I take it we hear that as S2 follows S1, so O2 followed O1. That is a third observation. And also: We hear that O2 occurs because of O1; that is, the explanation for O2 occurring is that O1 did. That is a fourth observation.

I want the apparatus to show how we come to hear those facts also.

If I asked you to explain the group of observations which I have made, observations which you could have made just as well – and let me note, they are *not* proposed as sociological findings, but rather do they pose some of the problems which sociology shall have to resolve – you might well say something like the following: We hear that it is the mommy of the baby who picks the baby up, because she's the one who ought to pick it up, and (you might eventually add) if she's the one who ought to pick it up, and it was picked up by somebody who could be her, then it was her, or was probably her.

You might go on: While it is quite clear that not any two consecutive sentences, nor even any consecutive sentences that report occurrences are heard, and properly heard, as reporting that the occurrences have occurred in the order which the sentences have, if the occurrences ought to occur in that order, and if there is no information to the contrary (such as a phrase at the beginning of the second, like 'before that, however') then the order of the sentences indicates the order of the occurrences. And these two sentences do present the order of the occurrences they report in the proper order for such occurrences. If the baby cried it ought to have cried before the mother picked it up, and not after. Hearing it that way the second is explained by the first; hearing them as consecutive[2] or with the second preceding the first, some

---

[2] This ought to be 'simultaneous' oughtn't it?

further explanation is needed and none being present we may suppose that it is not needed.

Now let me make a fifth observation: All of the foregoing can be done by many or perhaps any of us without knowing what baby or what mommy it is that might be being talked of.

With this fifth observation it may now be noticed that what we've essentially been saying so far is that the pair of sentences seem to satisfy what a Member might require of some pair of sentences for them to be recognizable as 'a possible description.' They 'sound like a description' and some form of words can, apparently, sound like a description. To recognize that some form of words is a possible description does not require that one must first inspect the circumstances it may be characterizing.

That 'possible descriptions' are recognizable as such, is quite an important fact, for Members, and for sociologists.

The reader ought to be able to think out some of its import for Members; for example, the economies it affords them. It is the latter clause, 'and for sociologists,' that I wish to now attend.

Were it not so both that Members have an activity they do, 'describing,' and that at least some cases of that activity produced, for them, forms of words recognizable as at least possible descriptions without having to do an inspection of the circumstances they might characterize, then it might well be that sociology would necessarily be the last of the sciences to be doable. For, unless sociologists could study such things as these 'recognizable descriptions,' we might only be able to investigate such activities of Members as in one or another way turned on 'their knowledge of the world' when sociologists could employ some established, presumptively correct scientific characterizations of the phenomena Members were presumably dealing with, knowing about.

If, however, Members have a phenomenon, 'possible descriptions' which are recognizable per se, then the sociologist need not in the first instance know how it is that babies and mommies do behave to examine the composition of such possible descriptions as Members produce and recognize. Sociology and anthropology need not await developments in botany or genetics or analyses of the light spectra to gain a secure position from which Members' knowledge, and the activities for which it is relevant, might be investigated.

What the sociologist ought to seek to build is an apparatus which will provide for how it is that any activities, which Members do in such a way as to be recognizable as such to Members, are done, and done recognizably. Such an apparatus may be called 'a culture.' It will of course generate and provide for the recognizability of more than just 'possible descriptions' and in later lectures we shall be engaged in providing for such activities as 'inviting,' 'warning' and so forth, as the data we consider permits and requires.

My reason for having gone through the observations I have so far made was to give you some sense, right off, of the fine power of a culture. It does not merely fill brains in roughly the same way, it fills them so that they are alike in fine detail. The sentences we are considering are after all rather minor,

and yet the operation of the culture, whatever it will look like, is such that you all, or many of you, hear just what I said you heard, and many of us are quite unacquainted with each other. I am, then, dealing with something real and something finely powerful.

We may begin to work at the construction of the apparatus. I'm going to introduce several of the terms we need. The first term is 'membership categorization device' (or just 'categorization device'). By this term I shall intend: Any collection of membership categories, containing at least a category, which may be applied to some population containing at least a Member, so as to provide, by the use of some rules of applications, for the pairing of at least a population Member and a categorization device member. A device is then a collection plus rules of application.

An instance of a categorization device is the one called 'sex:' its collection is the two categories (male, female). It is important to observe that a collection consists of categories 'that go together:' For now, that may merely be seen as a constraint of the following sort; I could say that some set of categories were a collection, and be wrong. I shall present some rules of application very shortly.

Before doing that, however, let me observe that 'baby' and 'mommy' can be seen to be categories from one collection: The collection whose device is called 'family' and which consists of such categories as (baby, mommy, daddy, etc.) where by 'etcetera' we mean that there are others, but not any others, not, for example, 'shortstop'.

Let me introduce a few rules of application. It may be observed that if a Member uses a single category from any membership categorization device then they can be recognized to be doing *adequate reference* to a person. We may put the observation in a negative form: It is not necessary that some multiple of categories from categorization devices be employed for recognition, that a person is being referred to, to be made; a single category will do. (We do not by this mean that more cannot be used, only that for reference to persons to be recognized more need not be used.) With that observation we can formulate a 'reference satisfactoriness' rule, which we call the 'economy rule.' It holds: A single category from any membership categorization device can be referentially adequate.

A second rule I call the 'consistency rule.' It holds; If some population of persons is being categorized and if a category from some device's collection has been used to categorize a first Member of the population, then that category or other categories of the same collection *may* be used to categorize further Members of the population. The former rule was a 'reference satisfactoriness' rule; this latter one is a 'relevance' rule. We shall very carefully consider the import of relevance rules in the ensuing lectures.

The economy rule having provided for the adequate reference of 'baby,' the consistency rule tells us that if the first person has been categorized as 'baby' then further persons may be referred to by other categories of a collection of which it is a member, and thus that such other categories as 'mommy' and 'daddy' are relevant given the use of 'baby.'

While in its currently weak form and alone, the consistency rule may

exclude no category of any device, even in this weak form (the 'may' form – we shall eventually introduce a 'must' form) a corollary of it will prove to be useful. The corollary is a hearer's maxim. It holds: If two or more categories are used to categorize two or more Members to some population, and those categories can be heard as categories from the same collection, hear them that way. Let us call the foregoing 'the consistency rule corollary.' It has the following sort of usefulness. Various membership categorization device categories can be said to be ambiguous. That is, the same categorial word is a term occurring in several distinct devices, and can in each have quite a different reference; they may or may not be combinably usable about a single person. So, for example, 'baby' occurs in the device 'family' and also in the device 'stage of life' whose categories are such as (baby, child, . . .adult). A hearer who can use the consistency rule corollary will regularly not even notice that there might be an ambiguity in the use of some category among a group which it can be used to hear as produced via the consistency rule.

It is of course clear that the two categories 'baby' are sometimes combinably referential and sometimes not. A woman may refer to someone as 'my baby' with no suggestion that she is using the category that occurs in the stage of life device; her baby may well be a full-fledged adult. In the case at hand that problem does not occur, and we shall be able to provide the bases for its not occurring, i.e., the bases for the legitimacy of hearing the single term 'baby' as referring to a person located by reference both to the device 'family' and to the device 'stage of life.'

With this, let us modify the observations of paragraph 2 of page 7[3], as follows: The consistency rule tells us that if a first person has been categorized as 'baby' the further persons may be referred to by categories from either the device 'family' or from the device 'stage of life.' However, if a hearer has a second category which can be heard as consistent with one locus of a first then the first is to be heared as *at least* consistent with the second.

Given the foregoing we may proceed to show how the combined reference of 'baby' is heard for our two sentences, and also how 'the mommy' is heard as 'the mommy of the baby.' We shall deal with the latter task first, and we assume from now on that the consistency rule corollary has yielded at least that 'baby' and 'mommy' are heard as from the device 'family.' We assume that without prejudice to the further fact that 'baby' is also heard as 'baby' from the device 'stage of life.'

The device 'family' is one of a series which you may think of by a prototypical name, 'team.' One central property of such devices is that they are, what I am going to call, 'duplicatively organized.' I mean with that term to point out the following: When such a device is used on a population what is done is to take its categories, treat the set of categories as defining a unit, and place Members of the population into cases of the unit. If a population so treated is counted, one counts not numbers of daddies, numbers of

---

[3] Coincides with paragraph 6, p. 246 above.

mommies and numbers of babies, but numbers of families – numbers of 'whole families,' numbers of 'families without fathers,' etc.

A population so treated is partitioned into cases of the unit, cases for which what properly holds is that the various persons partitioned into any case are 'co-incumbents' of that case.

To these ways of dealing with populations categorized by way of devices that are duplicatively organized there are correlative 'hearers maxims.' One that is relevant to our current task holds: If some population has been categorized by use of categories from some device whose collection has the 'duplicative organization' property, and a Member is presented with a categorized population which *can be heard* as co-incumbents of a case of that device's unit, then hear it that way. (We shall consider the underscored phrase shortly.) Now let it be noticed that this rule is of far more general scope than we may seem to need, and in focussing on a property like 'duplicative organization' it permits a determination of an expectation (of sociologists) as to how some categorized population will be heard independently of a determination of how it is heard. It is then formal and predictive, as well of course as quite general.

Now, by the phrase 'can be heard' we mean to rule out predictions of the following sort. Some duplicatively organized devices have proper numbers of incumbents for certain categories of any unit. (At any given time a nation-state may have but one president, a family but one father, a baseball team but one shortstop on the field, etc.) If more incumbents of a category are proposed as present in the population than a unit's case can properly take then the 'can be heard' constraint is not satisfied, and a prediction would not be made.

The foregoing analysis shows us then how it is that we come to hear, given the fact that the device 'family' is duplicatively organized, and the 'can be heard' constraint being satisfied, 'the mommy' to be 'the mommy of the baby.' It does of course much more than that. It permits us to predict, and to understand how we can predict, that a statement such as: "The first baseman looked around. The third baseman scratched himself. . ." will be heard as saying "the first baseman of the team on which the third baseman is also a player. . ." and the converse.

Or, putting the claim more precisely, it shows us how, in part. In part, because for the materials at hand it happens that there are other means for providing that the same hearing be made, means which can operate in combination with the foregoing – otherwise sufficient ones – to further assure the hearings we have observed. This will be done in the next lecture. Let us now undertake our second task, to show how 'the baby' is heard in its combined form, i.e., as the category with that name from both the 'stage of life' device, and from the 'family' device.

Let me introduce a term which I am going to call 'category-bound activities.' While I shall not now give an intendedly careful definition of the term, what I shall do is to indicate what I mean to notice with it and then in a while offer a procedure for determining for some of its proposed cases that

they are indeed cases of it. By the term I intend to notice that many activities are taken by Members to be done by some particular or several particular categories of Members where the categories are categories from membership categorization devices.

Let me notice then, as is obvious to you, that 'cry' is bound to 'baby;' that is, to the category 'baby' which is a member of the collection from the 'stage of life' device. Again, the fact that Members know that this is so only serves, for the sociologist, to pose some problem. What we want is to construct some means by reference to which a class, which proposedly contains at least the activity-category 'cry' and presumably others, may have the inclusion of its candidate-members assessed. We will not be claiming that the procedure is definitive as to exclusion of a candidate-member, but we will claim that it is definitive as to inclusion of a candidate-member.

It may be observed that the members of the 'stage of life' collection are 'positioned' (baby. . .adolescent. . .adult. . .), an observation which, for now, we shall leave unexamined. I want to describe a procedure for praising or degrading Members, the operation of which consists of the use of the fact that some activities are 'category-bound.' If there are such procedures, that will provide one strong sense of the notion 'category-bound activities' and also will provide for any given candidate activity a means of warrantably deciding that it is a member of the class of category-bound activities.

For some positioned-category devices it can be said as between any two categories of such a device that A is either higher or lower than B, and if A is higher than B, and B is higher than C, then A is higher than C.

We have some activity which is a candidate-member of the class 'category-bound activities' and which is proposedly bound to some category C. Then, a member of either A or B who does that activity may be seen to be degrading himself, and may be said to be 'acting like a C.' Alternatively if some candidate-activity is proposedly bound to A, a member of C who does it is subject to being said to be acting like an A where that assertion constitutes 'praising.'

If we, using the 'stage of life' categories, subject 'crying' to such a test we do find that its candidacy as a member of the class 'category-bound activities' is warrantable. In the case of 'crying' the results are even stronger. For, it appears, if a 'baby' is subject to some circumstances which would for such a one warrant crying, and he does not, then his 'not crying' is observable, and may be used to propose that he is 'acting like a big boy' where that assertion is taken to be 'praise.'

The foregoing procedure can obviously enough be used for other devices and other candidate activities. Other procedures may also be used; for example, one way to decide that an activity is category-bound is to see whether, the fact of membership being unknown, it can be 'hinted at' by naming the activity as something one does.

   S : So, you can't watch television. Is there anything you can stay interested in?

C: No, not really.

S: What interests did you have before?

C: I was a hair stylist at one time. I did some fashions now and then. Things like that.

S: Then why aren't you working?

C: Because I don't want to, I guess. Maybe that's why.

S: But do you find that you just can't get yourself going?

C: No. Well, as far as the job goes?

S: Yes.

C: Well, I'll tell you. I'm afraid. I'm afraid to go out and look for a job. That's what I'm afraid of . But more, I think I'm afraid of myself because I don't know. I'm just terribly mixed up.

S: You haven't had any troubles with anyone close to you?

C: Close to me. Well, I've been married three times and I'm– Close, you mean, as far as arguments or something like that?

S: Yes.

C: No, nobody real close. I'm just a very lonely person. I guess I'm very–

S: There's nobody who loves you.

C: Well, I feel that somebody must some place, but I don't know where or who.

S: Have you been having some sexual problems?

C: All my life.

S: Uh huh. Yeah.

C: Naturally. You probably suspect – as far as the hair stylist and – either go one way or the other. There is a straight or homosexual, something like that. I'm telling you, my whole life is just completely mixed up and turned over and it's just smashed and smashed and I'm not kidding.

Having constructed a procedure which can warrant the candidacy of some activity as a member of the class category-bound activities, and which warrants the membership of 'cry' and provides for its being bound to 'baby,' i.e., that category 'baby' which is a member of the 'stage of life' collection, we move on to see how it is that 'the baby' in our sentence is heard in the combined reference we have proposed.

We need, first, another hearer's maxim: If a category-bound activity is asserted to have been done by a member of some category where, if that category is ambiguous (i.e., is a member of at least two different devices) but where at least for one of those devices the asserted activity is category-bound to the given category, then hear that *at least* the category from the device to which it is bound is being asserted to hold.

The foregoing maxim will then provide for hearing "The baby cried" as referring to at least 'baby' from the 'stage of life' device. The results obtained from the use of the consistency rule corollary being independent of that, are combinable with it. The consistency rule corollary gave us at least that 'the

baby' was the category from the device 'family.' The combination gives us both.

If our analysis seems altogether too complicated for the rather simple facts we have been examining, then we invite the reader to consider that our machinery has intendedly been 'overbuilt.' That is to say it may turn out that the elaborateness of our analysis, or its apparent elaborateness, will disappear when one begins to consider the amount of work that the very same machinery can perform.

In the next lecture we shall attempt to show that the two sentences, "The baby cried. The mommy picked it up," constitute a possible description.

In the third lecture we will examine the central significance that the various rules, such as the consistency rule and the hearer's maxims, have for social sciences. It is, we now but assert, by reference to these that the equivocality which undercuts almost all previous social science research may be removed.

Lecture 2

"The baby cried. The mommy picked it up"

We're talking about these two sentences, "The baby cried. The mommy picked it up." I want to consider some of the import of the fact that some activities are, as I put it, 'category-bound.' The import I'm going to consider, relevant to the issue of a description, how they're made, is somewhat separate from coming to see some offered statement as a description or a possible description, and concerns how, given some occurrence, one can come to formulate what one takes to be a description of it, because that will in part turn on the fact that some of these activities are category-bound.

Now an initial relevance can't probably that easily be seen by reference to this pair, 'baby' and 'cried,' but it's present there as well, though it can be more easily seen with respect to the next – 'the mommy' and 'picked it up,' and that concerns the issue of what I argue in the paper I've given you, and what you can easily enough see when you consider it, that for any person being characterized by a category from one of these categorization devices, it's always the case that alternative categories could categorize the same person, where 'alternative' means, not from within the same collection, but by a category from a different collection. So that if you use 'sex:' 'male/female,' you could say "the male cried." Now you don't. But let's leave that aside for the moment. Now the fact that activities, or some, are category-bound, provides another relevance rule for choosing categories. The first relevance rule I gave you was this consistency rule which said that if you had a category assigned to a first person, then in categorizing second and third persons you could select categories from the same collection that was used in the first instance to categorize the first. That had a corellate – the hearing maxim I gave you, i.e., that if there are two categories which can be heard as from the same collection, hear them as from the same collection. Now, another relevance rule turns on the following. It turns on this fact that some activities are category-bound. Here's one way it works. Let's consider it, just for the purposes of making the matter intuitively easier to see, by reference to this second sentence. You're standing somewhere and you see two people you don't know. Suppose one is a child. Suppose the second is a female adult. The first cries. The second picks it up. What you see is that the one who picks it up is the mommy of the baby.

Now again you could see in principle – that is, in principle you could apply

---

Except for the title, this is the unedited text of the original transcript.

any number of categories to the same person – the fact that picking up crying babies is in the first instance the business of the mommies of them operates to have you see that as not merely 'a' mommy, but that mommy who is the one who is supposed to pick up her baby. Now you can see her as the mommy of that baby without in the first instance knowing that she's either a mommy or, in fact, the mommy of that baby.

Now what's a consequence of that, or what are some consequences of that, that are worthy of noticing? First of all, if it's the case that what we would conventionally call a 'norm,' what members of the society would call a norm or rule of proper behavior, says something like mommies ought to soothe their crying babies, then what seems to be present is not simply that that's a maxim of good behavior for mommies, but that one can use it to see who it is that's doing something which it can characterize. So these sets of norms, then, can operate to provide for how it is that you observe some set of activities, and see them not merely as correctly characterized by you, but as some activity correctly occurring. By 'correctly occurring' I mean, you don't say "Who's that lady who's picking up that baby?," where that could be something very wrong. I'll make that clear in a moment.

It's a rather regular thing that happens which the foregoing can analyze for us. You read it in the papers, it goes like this. A woman is assaulted in a car on Wilshire Boulevard. She says, "All sorts of people passed by. Nobody did a thing." Some of the witnesses are gotten to, and they say "Yeah, sure I saw it, but I figured it was her husband and they were having a family argument," which is something that's okay for a husband and wife to have, and which also provides that it's none of their business to interfere. You see a man standing on the street, say an adult male, and you see him smack a 15-year-old girl. That could be something that you ought to intervene in, except, it would be fairly regular that in the first instance what you see is 'a father chastising his daughter' and not 'a strange man assaulting some strange girl,' where in either case you know neither of them. So what seems to happen is that for activities that are category-bound what one sees when one sees a pair, a triplicate, a single person, doing one of them, is that they are the person who properly does that. Now that's a different sense of 'norms regulating activities' than one might usually use in doing sociology or anthropology, where it would be said by and large that the norms are followed by those persons who do the things – or ought to be. They provide also, then, for how it is that persons who know neither of the people, come to choose what categories they ought to use, or they do naturally use, to see what it is that's going on. And in that sense they provide rules of relevance for selecting categories.

So again, now, if what we had is a scene, somebody who could be a baby crying, somebody who could be a mommy, the mommy of the baby, picking it up, then what you see is that taking place, and we get now another sense in which this pair of sentences can be seen as a description in a way that can also be seen to be 'apart from identifying the circumstances;' that is, apart from investigation. One doesn't ask, one doesn't rely on having to know who

those people are in the first instance. One can see it, and see it as correctly characterized by you via 'the description.' Such a fact is of immense importance because it would be the kind of violations of norms that would not permit that to get done that would be, probably, much more consequential than those violations which would involve mommies not picking up their babies. Were it the case that you had to decide in some way like going up and asking these persons whether they were the proper set of people to be doing whatever it is they're doing, then the world might become much more complicated than it is. And I will call, in principle, such things as people 'passing' under such rules, 'subversion.' When a woman walks away from a supermarket with the baby carriage filled with a baby that's not hers, that's the sort of thing I'm talking about with 'subversion.' It's not seeable.

There are a variety of further things I want to deal with about these sentences. One of them I'll deal with at considerable length in a while, and it concerns now not the characterized events, i.e., the things these may be talking about, but what makes an adequate characterization of these – again, independently of what it is that's taking place – because that has some very important consequences. "The baby cried. The mommy picked it up." That's perfectly okay, and we don't have to know in the first instance where the mommy was when the baby cried, how it happened to come on the scene, or anything else. The baby cried, the mommy picked it up. "The baby cried" not only provides that the mommy ought to, but in some way provides that mommy will be around to do it.

Now we'll say that for some pairs of activities, pairs of actions that are related by norms, that there's at least a rule of adequate description which says 'character appears on cue,' i.e., if the first takes place and it's an adequate grounds for the second taking place, then it's okay to describe the thing without having provided for how it is that that second person happened to come on the scene to do whatever it is they properly do, if one says the first occurs and the second occurs as well. Now that seems like a very literary kind of rule, and you might take it that it holds for the Greek dramas, maybe, but not anywhere else, but that's not true, and it's also important that I just said that there's two actions related by norms. It does not merely involve a situation where the second – the person who does the thing that's second – is bound to do it, given the first, but if the first is, for example a violation, then you can provide that the second occurred. For example, "He was speeding and he got arrested." Perfectly okay. One needn't provide for the fact that the policeman somehow got on the scene.

Now I'll try to squeeze out some consequences of that in a while, but it's a task, so let me just hold off. I only wanted to indicate to you that this kind of thing – two occurrences properly tied together – the character-appears-on-cue rule will make, then, that description adequate.

I've been talking alternatively of this as 'possible description' or 'possibly correct description,' and the technical term I'll tend to use is 'potentially correct description' for things like it. Now that's going to be discriminated from what we could call an 'actually correct description' which would be such

a thing used on some occasion where it's talking about something it characterizes, in contrast to what it is here, perhaps, a story, or what it could also perfectly well be, a lie. The power of good lies is that they could be good descriptions, and what would differentiate the phenomenon 'lies' from 'a story' would be that the one who tells the story makes no claim at all that he's talking about some actual occurrence. A liar is presumably engaged in passing off his potentially correct description as actually correct. That suggests one fairly neat thing. If you're dealing with young children, one of the things you'd like to know about them is, first, when do they have the competence to lie? And what size of the things that they talk about do they have the competence to lie about? Stories are, then, a very useful phenomenon; that is to say, children's stories are very useful for adults, since if a child can tell a story which passes as a description, then you can figure that you better watch out for those things that they do not propose, as such, as stories, but propose as actual descriptions.

Now, in coming to see how this thing might be a story, it is of course perfectly obvious, or it ought to be obvious, that the sheer fact that this lady asked the kid to tell her a story doesn't tell us that that's a story. To suppose that it does is to simply fall into the most characteristic error of social science, which is only to interpret the answers to questions and not the questions. Now what we have to do then is to come to some way of formulating what makes something a story. Then, to see whether that formulation we make holds, i.e., characterizes the object we're considering. It could be either that the child doesn't know what a story is, or it doesn't feel like telling one. Maybe it supposes that it has fool enough audience so that anything it says will be considered its version of a story. Also, of course, we'd like to know does the kid have a good idea of what it is that it takes to make a story? There are a variety of reasons why that could be of interest. First, there are lots of parts of stories, or some parts of stories, that are rather standardized cultural objects, and we would like to know whether the kid has them under control and knows that the way you build one is to use those things.

For example, 'once upon a time.' That's a story-beginning. One thing about some stories anyway is that they have special ways of beginning. That is to say, one can differentiate between a 'start,' which could be anything, and the fact that the first thing that occurs is a 'beginning.' And perhaps the last thing that occurs is an 'ending.' Now if we start off with endings, then we find that in this story, and in some of the others, it does look like the kids know that there ought to be an ending. And again, I mean by 'ending,' something different than, distinctive from, simply stopping, but that we can characterize the thing as an 'ending.' If it is an ending, and it occurred in last position, then we have an ending for the story. If it's something that looks like a beginning and it occurred in the first position, it looks like we have a beginning. We could then say that the ending occurred too soon, as is often said, or that it stopped but there was no end, it had no beginning, etc., etc., all those possibilities where we have an object and a position.

Now what it takes to make an ending, I certainly am not going to

formulate exhaustively. But if you look at, say, the close of this story and others, then it looks like we've got an ending there, and it looks like we have something that was built as an ending. The story ends, "and she went to sleep," i.e., the kid takes an end to something, not just anything either, a most natural ending, i.e., an ending to the day, and uses it to end the story.

Now the problem of beginnings is a rather more complicated one, and we'll try to deal with it a little. The problem with beginnings for kids' talk is a special one because, we might say, first roughly and only as an assumption to see whether it's so – though naively it's obvious – kids have restricted rights to talk. That being the case, by assumption, let's see whether the ways that they go about beginning to talk can be most adequately seen to be solutions to the problem of getting to talk under restricted rights. What we want to do is see whether their beginnings are a more or less nice, methodical solution to a problem which focusses on having to have a good way to begin.

Kids around the age of three – and that's what we're dealing with here – go through a time when they have what may be almost a universal way of beginning any piece of talk they make to adults. They use it just about every time. It has a little bit of variation, but it's a thing like "You know what, Daddy?," "You know something?," things like that. What we want to do is to analyze that, to see how it's a beginning, and to see how, as a beginning, its providing a solution to their having restricted right to talk informs us that our notion that they have restricted right to talk is correct.

I'll introduce, without data at this point because the facts are so simple and obvious that you can check them out easily enough for yourself – you know them anyway – a couple of rules of conversational sequencing, two-party sequencing. Two-party conversations are a special basic phenomenon, and what I say is not intended as applying to three-or-more-party conversations. One basic rule of two-party conversations concerns a pair of objects, questions and answers. It says, if one person asks a question, the other person answers it. I will have to give characterizations of those objects, but I'm not going to do it now. I'll do it when we get to discussing conversation much more seriously.

A second rule, and it's an absolutely fundamental rule because by reference to it the infinite character of a conversation can be found, is, the person who has asked the question can talk again after the other answers, and can ask a question. I call it the 'chaining rule,' and obviously it has as its consequence that a conversation, in principle, its method, has no finite length but is just extendable in this fashion: Q, A, Q, A, Q, A.

Now here's a question: "You know what?" It has, as a question, an extremely curious kind of answer, and the answer is one of those fairly rare but not altogether rare objects which, as an answer, is also a question, i.e., "What." With that as a question, the question–answer rule is turned around. The kid's been asked a question. It's his business to answer. You can characterize, then, the restriction as involving a right to use a first item, which, however, in this case, is the first item that for anybody else is a chainable right; that is, indefinitely extendable. Kids don't use it that way. They use it simply

to set up the other person in the position of questioner. They thereafter do not proceed on their own say-so, or by reference to the chaining rule, but as obliged to talk under the position of an answerer.

Now of course it happens to be that the question they elicit with their question has altogether open form, and what stands as an answer is whatever the kid takes it to be an answer, and thereby provides him with the opportunity to say what it is that he wanted to say in the first place. However, now not on his own say-so, but under obligation. That's very nice. Three-year-old kids are kind of clever. In that case, then, what it looks like is that the kids take it they have a right to begin, to make a first statement, and nothing much more. That being the case we can focus on their beginnings as not just the first thing they happen to say, but as something which can be examined for its status as a 'beginning' to see whether, again, it will be the case that what it is that's put in first position in the story is something that stands as a beginning. "The baby cried" reports a piece of trouble. It's a kind of special item in itself, in that if we can talk of something like 'once upon a time' as a token of a story-beginning, it just happens to be your beginning because that's the way stories begin. In that sense, a token. You give nickels, whatever, because that's what you give, as compared to this thing being a 'beginning' in some special way, by way of its properties.

Then we'll introduce, as a nothing-special term, there's another kind of beginning, which we'll call 'tickets.' Tickets are kind of interesting in that they're beginnings of the following sort.

Q: What was that word?
HS: Tickets.
Q: Tickets?
HS: Yeah. T-i-c-k-e-t. I use it for the following reasons. Suppose two
      people, two adults, don't have rights to talk to each other, in general.
      They are not, under whatever formulation there may be – and I'll try
      to formulate such things eventually – persons who converse with
      each other. There are conditions under which they can talk, or one
      can talk to the other, and that those conditions are the conditions
      being used to begin a piece of talk for them, is something they can
      deliver in the first piece of talk, via a ticket. Which is to say that they
      say something which, having been said, warrants that they've talked
      in the first place. Like, "Your pants are on fire." ((laughter)) It's not
      just an opening, but it's telling you why I'm talking. The occurrence
      of trouble is, then, that sort of object. Persons who have – now, not
      simply children who have generally restricted rights, but for any pair
      of persons who otherwise don't talk to each other, they can use a
      ticket as a beginning. One kind of ticket is the announcement of
      some trouble. That holds for whoever it is you're talking to, and
      that's, then, the sort of object that "the baby cried" is. If the baby
      cried, then "the baby cried" is a perfectly good thing to say, anybody
      can say it, including a child who otherwise shouldn't talk, and

should say it as a first statement. Okay, so we can find out how that's a beginning. If then it's a beginning in general, it can be a beginning of a story.

It has a little bit of side relevance that concerns the following. If you look at all these stories, the overwhelming number of them are, in one way or another, tragic, and we could read directly from them into what we suppose the children's fantasy lives look like and say it's filled with all sorts of horrors. At least a partial alternative, though I certainly don't claim to be saying what their fantasy lives are full of, the character of the stories could be partially accounted for by reference to those things that kids can properly talk of or have as occasions for talking, which are, troubles. But that's neither here nor there.

I don't have time now. I'll continue next time. What I want to do then is further spell out this business of 'characters appear on cue.' Now let me just say what I want to do, and I'll say it because you can pull features out of certain stories which will be in point. I'd like to suggest the following. We may find from a set of stories that kids may take it, young kids anyway, that the occurrence of the trouble that involves them in crying or whatever, is sufficient to bring the assistance, and that danger, then, is a rather different object than you would like it to be for them. I pose a problem which is how do you get them to see, not simply that the fact that they're in trouble doesn't mean that they're going to be pulled out, but that if they want some people around, the simplest way is not to go jump in the river or something like that.

Now if you look at a bunch of the stories and you take it that they're possibly mapable onto what it is that the kid figures is going on, you may get some such idea, and you may try to work out some way of shifting that around – if you don't think there are already too many kids around.

Okay. Continue next time.

Lecture 2 (R)

(first revised draft (February 24, 1966)

"The baby cried. The mommy picked it up"

I am examining the two sentences, "The baby cried. The mommy picked it up," and in this second lecture I shall proceed in much the same manner as I did in the first, beginning with some observations and then exploring their import. I shall focus first on the fact that an activity can be category-bound and then on the import of there being a norm which provides for some second activity given the occurrence of a first, considering both of these with regard to the 'correctness,' for Members, of 'possible descriptions.'

Let me leave aside our two sentences and for the moment consider instead some observations on how it is that I see, and take it you see, describable occurrences.

Suppose you are standing somewhere, and you see a person you don't know. The person cries. Now, if I can, I will see that what has happened is that a baby cried. And I take it that you will, if you can, see that too. That's a first pair of observations. Suppose again you are standing somewhere and you see two people you don't know. Suppose further, one cries, and the other picks it up. Now, if I can, I will see that what has happened is that a baby cried, and its mother picked it up. And I take it that you will, if you can, see that too. That's a second pair of observations.

Consider the first pair of observations. The modifying phrases, to deal with them first, refer simply to the possibility that the category 'baby' might be obviously inapplicable to the crier. By reference to the 'stage of life' collection the crier may be seen to be an adult. And that being so, the 'if . . . can' constraint wouldn't be satisfied. But there are certainly other possible correct characterizations of the crying person. For example, without respect to the fact that it was a baby, it could be either 'male' or 'female' and nonetheless I wouldn't, and I take it you wouldn't, seeing the scene, see that 'a male cried' if we could see that 'a baby cried.'

The pair of observations suggest the following 'viewer's maxim:' If a Member sees a category-bound activity being done, then, if one can see it being done by a member of a category to which the activity is bound, see it that way. The viewer's maxim is another 'relevance rule' in that it proposes that for an observer of a category-bound activity, the category to which the activity is bound has a special relevance for formulating an identification of its doer.

Except for the title, this is the unedited text of the original revised draft.

Consider the second pair of observations. As Members, you of course know that there is a norm which might be written as: A mother ought to try to soothe her crying baby. I, and you, not only know that there is such a norm, but, as you may recall, we used it in doing our hearing of "The baby cried. The mommy picked it up." In addition to the fact of duplicative organization, the norm was relevant in bringing us to hear that it was the mommy of the baby who did the picking up. While we would not have heard that it was the mommy of the baby for other pairs of activities in which the two were involved (but not any pair) the fact that the pair were relatable via a norm which assigns the mother of the baby that duty may have operated in combination with the duplicative organization to assure our hearing that it was she who did it.

Leaving aside the hearing of the sentence, we are led to construct another 'viewer's maxim:' If one sees a pair of actions which can be related via the operation of a norm that provides for the second given the first, where the doers can be seen as members of the categories the norm provides as proper for that pair of actions, then (a) see that the doers are such Members, and (b) see the second as done in conformity with the norm.

This second viewer's maxim suggests a rather fundamental observation about norms. In the sociological and anthropological literature, the focus on norms is on the conditions under which, and the extent to which, they govern – or can be seen by social scientists to govern – the relevant actions of those Members whose actions they ought to control. While such matters are of course important, our viewer's maxim suggests other importances of norms, for Members.

Viewers use norms to provide some of the orderliness, and proper orderliness of the activities they observe. Via some norm, two activities may be made observable as a sequentially ordered pair. That is, viewers use norms to explain both the occurrence of some activity given the occurrence of another, and also its sequential position with regard to the other, e.g., that it follows the other, or precedes it. That's a first importance. Second, viewers use norms to provide the relevant membership categories in terms of which they formulate identifications of the doers of those activities for which the norms are appropriate.

Now let me observe, viewers may use norms in each of the preceding ways, and feel confident in their usage without engaging in such an investigation as would serve to warrant the correctness of their usages. This last observation is worth some further thought.

We may, at least initially, put the matter thusly: For viewers, the usability of the viewer's maxims serves to warrant the correctness of their observations. And that is then to say: The usability of the viewer's maxims provides for the recognizability of the correctness of the observations done via those maxims. And that is then to say: 'Correct observations' or, at least, 'possible correct observations,' are 'recognizable.'

(Members feel no need in warranting their observation, in recognizing its correctness, to do such a thing as ask the woman whether she is the mother

of the baby, or ask her whether she picked it up because it was crying. They feel no such need – so long, that is, as the viewer's maxims are usable.) In short: 'Correctness' is recognizable, and there are some exceedingly nice ties between recognizably correct description and recognizably correct observations.

One such tie which is relevant to the tasks we have undertaken is: A string of sentences which may be heard, via the hearer's maxims, as having been produced by use of the viewer's maxims, will be heard as a 'recognizably correct possible description.'

The rest of this lecture will be devoted to two tasks. I shall try to develop some further rewards of the analysis so far assembled, some consequences it throws off, and to show also how it is that the two sentences ("The baby cried. The mommy picked it up") can warrantably be said to be from 'a story.' I start with the latter task.

It ought to be apparent that, that the children whose talk is reported in *Children Tell Stories* were asked to tell a story, is not definitive of their having done so. It is, for one, at least possible that the younger ones among them are not capable of building stories, of building talk that is recognizable as 'a story' or, at least, as 'a possible story.'

It happens to be correct, for Western literature, that if some piece of talk is a possible description it is also, and thereby, a possible story or story-part. It appears, therefore, that having established that the two sentences are a possible description I have also, and thereby, established that they possibly are (at least part of) a story. To stop now would, however, involve ignoring some story-relevant aspect of the given sentences which are both interesting and subjectable to analysis. So, I go on.

Certain characteristics are quite distinctive to stories. For example, there are characteristic endings; 'and they lived happily ever after,' and characteristic beginnings; 'once upon a time.' I shall consider whether the possible story, a fragment of which we have been investigating, can be said (and I mean here, as throughout, 'warrantably said') to close with what is recognizable as 'an ending,' and to start with what is recognizable as 'a beginning.'

In suggesting a difference between 'starts' and 'beginnings,' and between 'closes' and 'endings', I am introducing a distinction which shall, as this course of lectures proceeds, come to have some prominence. The distinction, which is by no means original, may be developed by considering some very simple observations.

1 A piece of talk which regularly is used to do some activity – as "Hello" is used to do 'greetings' – may not invariably be so used, but may do other activities as well – as "Hello" is used to check out whether another with whom one is talking on the phone is still there or has been cut off – where it is, in part its occurrence in 'the middle' and not 'the start' of a conversation which serves to discriminate the use being made of it.

2 Certain activities not only have regular places in some sequence where they do get done, but may, if their means of being done is not found

there, be said, by Members, to not have occurred, to be absent.

For example, the absence of a greeting may be noticed as the following data, from field observations, indicates. The scene involved two adult women, one the mother of two children, ages six and ten. The kids enter, and the following ensues.

Lady: Hi
Boy: Hi
Lady: Hi, Annie
Mother: Annie, didn't you hear someone say hello to you?
Lady: Oh, that's okay, she smiled hello.
Mother: You know you're supposed to greet someone, don't you?
Annie: ((hangs head)) Hello.

3   Certain activities can only be done at certain places in a sequence. For example, a third strike can only be thrown by a pitcher after he has two strikes on a batter.

Observations such as these lead to a distinction between a 'slot' or 'position' and the 'items' which fill it, and to proposing that certain activities are accomplished by a combination of some item and some slot.

The notion of 'position' or 'slot' serves for the sociologist to mark a class of relevance rules. Thus, if it can be said that for some assertable sequence there is a position in which one or more activities properly occur, or occur if they are to get done, then: The observability of either the occurrence or the non-occurrence of those activities may be claimed by reference to having looked to the position and determined whether what occurs in it is a way of doing the activity.

An instance of the class of relevance rules might run: To see whether a conversation included 'greetings,' look to the first utterance of either party and see whether there occurs in it any item which passes as 'a greeting,' items such as (hello, hi, hi there, etc.). The fact that the list contains the term 'etc.' might be deeply troublesome were it not the case that while we are unable to list all the members of the class 'greeting items' we can say that the class is bounded, and that there are some utterables which are not members of it, perhaps, for example, "Colorless green ideas sleep furiously." If that and only that occurred in a first utterance we might feel assured in saying that a greeting did not occur.

Consider just one way that this class of relevance rules are important. First, roughly; they permit the sociologist to non-trivially assert that something was absent. Non-trivial talk of an absence requires that some means be available for showing both the relevance of occurrence of the activity that is proposedly absent, and the locating of where it should be looked for to see that it did not occur. Lacking these, an indefinite set of other activities might equally well be asserted to be absent given some occurrence, and the assertion in question not being discriminable from the (other) members of that indefinite set, it is trivialized.

It does seem that for stories it is correct to say that they can have beginnings, and we can then inspect the items that occur at their start to see whether they can be seen to make 'a beginning.' Given, further, that stories can have endings, we can inspect the items that occur at their close to see whether they can be seen to make 'an ending.'

While my main interest will be with the story's start as a possible proper beginning, let me briefly consider its close: "She went to sleep." With this, the speaker would seem to be not merely closing, but closing by making a proper ending. It so seems by virtue of the fact that such a sentence reports an occurrence, or can be heard as reporting an occurrence which is a proper ending to something for which endings are relevant and standardized, that very regularly used unit of orientation, the day. A day being recognized as ending for some person when they go to sleep, so a story may be recognized as closing with an ending if at its close there is a report of the protagonist's having gone to sleep. This particular sort of ending is of course not at all particular to stories constructed by young children; it, and other endings like it, from 'the last sleep,' death, unto the shutting down of the world, are regular components of far more sophisticated ventures in Western literature.

Let me turn then to the start, to consider whether it can be said to be 'a beginning.' I shall attempt to show that starting to talk to adults is, for small children, a rather special matter. I shall do that by focussing on a most characteristic way that small children, of around the age of the teller of the given story, open their talk to adults, i.e., the use of such items as 'You know what?' I shall offer an analysis of that mode of starting off, which will characterize the problems such a start can be seen to operate as a methodical solution to.

The promised analysis will warrant my assertion that starting to talk is, for small children, a special matter. That having been established, I shall turn to see whether the particular start we have for this story may be seen as another type of solution to the same problem that I will have shown to be relevant.

If I can then show that another solution is employed in our problematic utterance (the sentence "The baby cried"), I will have shown that the story starts with something that is properly a beginning, and that therefore, both start and close are 'proper' beginning and end. Such, in any event, are my intentions.

I begin: First, roughly, and only as an assumption (though naively, the matter is obvious) I assert that kids have restricted rights to talk. That being the case, by assumption, I want to see whether the ways that they go about starting to talk, with adults, can be most adequately seen to be solutions to the problem which focusses on needing to have a good start if one is going to get further than that. Starts which have that character can then be called 'beginnings.'

Now, kids around the age of three go through a period when some of them have an almost universal way of beginning any piece of talk they make to adults. They use things like: "You know what, daddy?" or "You know something, mommy?"

I will introduce a few rules of conversational sequencing. I will do that without presenting data now, but the facts are so obvious that you can check them out easily enough for yourself; you know the rules anyway. The sequencing rules are for two-party conversation; and, since two-party conversation is a special phenomenon, what I say is not intended as applying for three-or-more party conversation.

One basic rule of two-party conversation concerns a pair of objects, questions and answers. It runs: If one party asks a question, when the question is complete, the other party properly speaks, and properly offers an answer to the question, and says no more than that. The rule will need considerable explication, but for now it will do as it stands.

A second rule, and it's quite a fundamental one, because by reference to it the infinite character of a conversation can be seen is: A person who has asked a question can talk again; has, as we may put it, 'a reserved right to talk again,' after the one to whom he has addressed the question speaks. *And*, in using the reserved right, he can ask a question. I call this rule 'the chaining rule' and in combination with the first it provides for the occurrence of an indefinitely long conversation of the form Q, A, Q, A, Q, A, Q, A. . .

Now, the characteristic opener that we are considering is a question (e.g., "You know what?"). Having begun in that way a user who did not have restricted rights to talk would be in a position of generating an indefinite set of further questions as each question was replied to, or as the other otherwise spoke on the completion of some question.

But the question we begin with is a rather curious one, in that it is one of those fairly but not exceptionally rare questions which have as their answer, another question, in this case the proper and recurrent answer is "What?" The use of initial questions of this sort has a variety of consequences. First, if a question which has another question as its proper answer is used and is properly replied to, i.e., is replied to with the proper question, then the chaining rule is turned around, i.e., it is the initial answerer, and not the initial questioner who now has the reserved rights to speak again after the other speaks. The initial questioner has by his question either not assumed that he can use the chaining rule or has chosen not to. (Note that we are not saying that he has not chosen to invoke the chaining rule; he has instead given the choice of invoking it to the initial answerer. There are two different possibilities involved.)

Second, the initial questioner does not only make his second speech by virtue of the chaining rule but he makes it by virtue of the first sequencing rule i.e., by reference to the fact that a person who has been asked a question, properly speaks and properly replies to it. His second speech is then not merely not made as a matter of either the chaining rule or his choice by some other means of making a second speech, but it is something he makes by obligation, given the fact that he has been asked a question, and is therefore obliged to answer.

Third, however, the question he is obliged to answer is 'an open one' in the sense that what it is that an answer would be is something that its asker does

not know, and further, is one that its answerer by the prior sequence does. What an answer is, then, to the second question, is whatever it is the kid takes to be an answer, and he is thereby provided with the opportunity to say whatever it is he wanted to say in the first place. However, now, not on his own say so, but as a matter of obligation.

In that case, then, and the foregoing being a method whereby the production of the question "You know what?" may be explicated, we may take it that kids take it that they have 'restricted rights' which consist of a right to begin, to make a first statement and not much more. Thereafter they proceed only if requested to.

And if that is their situation as they see it, they surely have evolved a nice solution to it.

With the foregoing we can say then that a focus on the way kids begin talk is appropriate, and we can see whether the beginnings of stories – if they are not made of the culturally standardized beginnings (such as 'Once upon a time') – might be seen to be beginnings by virtue of the special situation which kids have vis-à-vis beginning to talk.

We may arrive at the status of "The baby cried" as a proper beginning, in particular as a start that is a beginning by virtue of being a proper opener for one who has restricted rights to talk, by proceeding in the following way. Let us consider another solution to the problem of starting talk under restricted rights. I'll begin by introducing a term, 'ticket.' I can show you what I mean to point to with the term by a hypothetical example. Suppose two adults are co-present and lack rights to talk to each other; for example, they have never been introduced, or whatever. For any such two persons there are conditions under which one can begin to talk to the other. And that those conditions are the conditions used to, in fact, begin talk is something which can be shown via a first piece of talk. Where that is done, we will say that talk is begun with a ticket. That is, the item used to begin talk is an item which, rights not otherwise existing, serves to warrant one having begun to talk. For example, one turns to the other and says, "Your pants are on fire." It is not just any opening, but an opening which tells why it is that one has breached the correct silence, which warrants one having spoken. Tickets, then, are items specially usable as first items in talk by one who has restricted rights to talk to another. And the most prototypical class of tickets are 'announcements of trouble relevant to the other.'

Now it is clear enough (cf. the discussion of norms earlier) that the occurrence of a baby crying is the occurrence of a piece of trouble relevant to some person, e.g., the mother of the baby. One who hears it gains a right to talk, i.e., to announce the fact that it has occurred, and can most efficiently speak via a ticket, i.e., "The baby cried." That being so, we can see then that the opener "The baby cried" is a proper beginning, i.e., it is something which can serve as a beginning for someone whose rights to talk are in the first instance restricted.

With the foregoing we have established that the story we have been examining has both a proper beginning and a proper end, and is thus not only

a story by virtue of being a possible description, but also by virtue of its employing as parts, items which occur in positions that permit one to see that the user knows that stories have such positions, and that there are certain items which, when used in them, are satisfactory incumbents.

Lecture 3
'Everyone has to lie'

There is no transcript of this lecture. Its materials became the paper 'Everyone has to lie,' now in M. Sanches and B. G. Blount (eds), Sociocultural Dimensions of Language Use (New York: Academic Press, 1975), 57–80. For the materials in lecture form, see Spring 1967, lectures 8 and 9.

A note on the Group Therapy Session materials

The bulk of the lectures of Spring 1966 deal with a segment of talk in a group therapy session for teenagers. The segment had been introduced in June 1965 as a final exam, and a series of lectures dealing with the materials was given in Fall 1965. The next presentation, given in Fall 1966, is not included in this volume. In the main, the Fall 1966 lectures were a reorganized repetition of the Spring 1966 lectures. There were some new considerations, expansions, etc., and many of those have been incorporated into the Spring 1966 series.

Whatever introductory discussion Sacks offered was not transcribed in the Spring or Fall 1966 lectures. In its place is a brief introductory note, made up of Sacks' remarks about the June 1965 final exam, and an introduction to the materials when he first presented them in Fall 1965.

Introduction

It seems to me that the core of this 11-minute segment from a group therapy session for teenage kids constitutes an 'initiation ceremony.' As such, among the things in it that are of interest, is the fact that it isn't done via a script. The participants are a therapist, male, about 35, three current patients, male, between 16–18 years, and the new entrant, another teenaged male. One of the kids in the group knew beforehand that somebody new was going to come that day, but that's about it. We are not dealing with a 'scripted' ceremony, nor with one for which the various parts have, even roughly, been previously assigned or previously worked out. And yet there are certainly features in it which the literature on initiation ceremonies proposes to be present in such events.

But our task is not going to be so much to see the extent to which that is so, but to try to come to terms with the conversation itself, as best we can. Now, the quickest way to find ourselves feeling hopeless at the task is to attempt to deal with the whole thing at once. We're going to be picking at it piece by piece. And there are a lot of events in it that are, to the altogether naive eye, quite remarkable. That is, without any analysis and simply by inspection you can find some things that you might take to be worth thinking about. Probably the most striking thing right off, would be that section on page 3 of the handout, where there's a series of questions run off in about 45 seconds, by the given members of the group to the new entrant, in which they ask him things about himself, giving in each of the questions what they take to be the answer. And the questions have some rather extraordinary detail in

them; for example, question ten, "you've been kicked out of school once." It is quite obvious that how these guys have that information, and what they do with it, are issues. And there are, aside from that, a variety of other things involved in this segment that we're going to have to consider in one way or another.

Handout: Group Therapy Session Segment

0:00   *Therapist*:   heh heh

         Roger: Kids don't drive long. They start off when they're si–by the time– when they're sixteen, by the time they're eighteen they're back walk(hh)ing hehh through circumsta(hh)nces hehhehh

         Therapist: beyond their control.

         Roger: Ehhehh yes hehhehh hotrodders // never–

         Al: It's all the cops' fault.

         Roger: Now the Soshes keep driving. Daddy's car and everything you know,

         Therapist: It's the cops' fault.

         Al: Yeah it's not ours we're per– we're // merely

         Roger: It's the insurance companies and the cops.

         Therapist: Yeah,

         Al: Damn right.

         Roger: Kids are completely innocent heh

         Al: We do race but the times we do get tickets are the only

0:30   times when we maybe goin' a long distance, uhh I dunno, I– depends on how many accidents you have, and how many of these tickets you get.

         Roger: I have got a speeding ticket on the average of one every three and a half months. Since I've been driving.

         Al: I haven't– I have never gotten a // ticket.

         Roger: And I deserve it.

         Therapist: ha ha ha

         Roger: I deserve it. Because I always drive about seven miles an hour faster than everybody else. You know? Like everybody's driving thirty five I'm driving about forty two somethin' like that. So this is the conseque(hh)ence I have to pay. 'Cause I can't stand driving that slow.

         Al: I have– I've– I've– all the time // I've been driving I haven't gotten a ticket but I've always– but I've always–

1:00   *Roger*:   Specially when I think I can handle a car at that speed. In traffic.

This is the text of the original Spring 1966 transcript, with an inclusion from retranscribing done in Fall 1966. With this new transcript came a new set of names for the participants: Mel, Joe, and Henry are now Al, Ken, and Roger, respectively.

Al:	I shoulda gotten a ticket // but uh
Therapist:	Uh huh
Ken:	Oh I can think of a million times when I should've gotten a ticket, going on the freeway. I'm always goin' seventy five. I mean I'm just I'm not racing, I'm right along with– or I'm right behind the guy ahead of me and he's just he's goin' as fast as I am and lotta people pass us up like we're sittin' still.
( ):	*Oh* yeh.
Al:	Like Roger.
Ken:	And the cops– the cops don't look at you when you just–
Roger:	But they're stockers.
⌈*Ken*:	If you're in a jeep–
⌊*Roger*:	But you drive a stocker. When a cop sees a hopped up car, he don't care if you're going forty five you must be doin' somethin' wrong, and if he wants to be mean, he can bust you on a thousand things.
Al:	He doesn't have to have a reason, you know you're not s– cops aren't supposed to talk to you unle– s–stop you unless you're doing something suspicious. If you have a hotrod that's enough.
Roger:	He can bust ya on a thousand things non-moving violations if you give him any lip, even if you didn't do anything wrong. They can just go over your car and write you up ticket this long.
Ken:	Sure. Well let him. You know–
Roger:	On Hollywood Boulevard the other night they were giving tickets for dirty windshields.
	((door opens))
Jim:	hh
Therapist:	Hi, Jim // c'mon in.
Jim:	H'warya
Therapist:	Jim, this is uh Al,
Jim:	Hi
Therapist:	Ken,
Jim:	Hi
Ken:	Hi
Therapist:	Roger.
Roger:	Hi
Jim:	Hi
Therapist:	Jim Reed.
( ):	((cough))
Ken:	We were in an automobile discussion
Roger:	discussing the psychological motives for
( ):	hhhhhhh ((not laughter, heavy breathing))

2:30 appears beside the Roger/Al exchange ("doin' somethin' wrong...").
3:00 appears beside *Jim*: hh.

	Al:	drag racing on the street.
3:30	*Ken*:	I still say though that if you take if you take uh a big fancy car out on the road and you're hotroddin' around, you're– you're bound to get you're bound to get caught, and you're bound to get shafted.

(   ):   (//   )

Ken: W'l look– I'm gonna–

Al: Not unless ya do it right. // That's the challenge– that's the challenge you wanna try and do it right so you don't get caught!

Roger: That's the problem with society. Hehheh

  ⌈*Roger*: (Ya gotta–)

  ⌊*Ken*: In that Bonneville of mine. I could take that thing out and if I've got a tie and a– a sweater on and I look clean? ninety nine percent of the time a guy could pull up to me in the same car, same color, same year the whole bit, roar

4:00   up his pipes and he's in a dirty grubby tee shirt, and the guy'll pick the guy up in the dirty grubby tee shirt before uh he'll pick me up.

(   ):   hah

Ken: Ju– just for–

Al: But not many people get picked up in a Pontiac station wagon.

Ken: hhhh Now (well) I agree it looks like a Daddy– it looks like a damn // Mommy's car.

Roger: Ken, face it. You're a poor little rich kid.

(   ):   ((cough))

Ken: Yes Mommy// thank you.

Roger: Face the music.

Al: Ok. Now you've got that er outta yer system. Now you're a poor little rich kid we've told you that.

Roger: And we also decided you're a chicken shit.

Al: heh hehhhh

4:30 ⌈*Ken*: I decided that years ago the hell with ya.

   ⌊*Al*: (   )

(   ):   hhh

Al: Now let's see what else can we decide about // you.

Roger: Hey don't tear him down.

Al: We're– Ok.

Ken: I've been // torn down for (   )

Al: (//   )

Roger: We got company heh

Al: (hh) Oh Ok.

Ken: (   ) hhhhh

Al: Tell us all about yourself so we can find something bad about you.

Ken:	Yes, hurry up.
Roger:	Well first of all you must be crazy or you wouldn't be here.
Ken:	heh heh
Jim:	Yeah that's how it goes.
Al:	Secondly, you must be an under-achiever.
Jim:	Yeah,
Roger:	You hate your mom and dad huh
Al:	–third of all. ((tied back))
Jim:	Oh, sometimes.
Al:	Fourth, you like to drive cars fast.
Jim:	Yeah,
Al:	Fifth you like to ta– you like uh wild times,
Jim:	Mm hm,
Ken:	He smokes like // me, see?
Al:	Sixth you like booze,
Jim:	Huh? // Yeah
Al:	Seven you like to smoke
Jim:	Mm hm

5:00

Roger:	And seven you've been arrested for rape and other things.
Al:	Eight you heh
Jim:	No, not that.
⌈ Ken:	hehheh
⌊ Jim:	hehh you're gonna ta(hh)lk
Al:	Eight you– Eight you uhm give lip back to everybody,
Jim:	Yeah,
Al:	Nine, you uhh cut classes,
Jim:	Yeah,
Al:	Ten, you've been kicked outta school once,
Jim:	Yeah,
Al:	Eleven, uhhh
( ):	wshhhh
Al:	hehh hhh hehh
Roger:	We're doin better than he is hahhehhehh Proceed I'm (w'ya) I'm with ya.
⌈Al:	heh heh Your turn.
⌊Ken:	(Oh–)
Roger:	Sure. Are you just agreein' because you feel you want to uh . . .
Jim:	Hm?
Roger:	You just agreeing?
Jim:	What the hell's that

5:30

Al:	It's– // agreeing?
Roger:	Agreeing.
Jim:	Agreen?
Roger:	Yeah.

	[*Al*:	With us. Just going along with us.
	Ken:	Agreein'.
	Jim:	No.
	( ):	(Yeh)
	Roger:	Saying // yes, yes, hehh hehh hehh
	( ):	((cough))
	Several:	((laughter))
	Jim:	Well it's true. Everything he said is true, so . . .
	[*Ken*:	Have you been kicked out of school?
	Al:	You wouldn't be in the group if you didn't.
	Jim:	Yeh
	Ken:	What school did you go to?
	Jim:	I went to Palisades.
	Roger:	Went?
	( ):	Oh oh
	Jim:	Yeah. And then to University from there.
	Roger:	Oh I went to Uni, I graduated there.
	Jim:	You did?
	Roger:	Bitchin' school isn't it.
	Jim:	Kinda groovy
	Roger:	( )
	Al:	What'd you do with the match // ( )
	Roger:	You don't like it do you?
	Ken:	I got it.
	Roger:	Here you go chum.
	Ken:	EVERYBODY'S FASTER THAN ME TODAY!
	Roger:	You got reflexes like a slow turtle.
6:00	*Ken*:	God damn you hehhahh
	Roger:	Remind me later I'll show you a little game about your reflexes.
	Ken:	Hey you got another one of those Santa Fe's?
	Roger:	Nah it's the last one.
	Ken:	Last one?
	[*Roger*:	Pity hehheh
	Al:	heh heh heh
	Roger:	Usually there's a broad in here. // Pretty (tough)
	Ken:	Her name is Louise. She's pretty good, she's real nice. ((cough))
	[( ):	I'd like to ( )
	Al:	There's a lotta her to love, // Hm?
	( ):	There's–
	Jim:	Sound like an old man.
6.30	*Ken*:	Tchhhh hehh This is the old– this is the– the couch society of– what is it?
	[*Al*:	Wanna join our army?
	Ken:	( )

Jim:	Huh?
Al:	Wanna join our army? We're gonna go defeat the king of Greece.[1]
Ken:	We're gonna—
Al:	The Academic Counseling Service army's gonna go—
Roger:	Alright Al, // he's been in here ten minutes.
Ken:	( ) Hey your match is still goin', Al.
Roger:	Al, he's been in here ten minutes let's judge his character.
Al:	Ok. Ready Roger?
Roger:	Ok.
Al:	You're first.
Ken:	You're gonna get killed.
Al:	hhehh
Ken:	Keep your mouth shut and don't say a damn wo(hh)rd
Ken:	heh
Roger:	He's not at all like Ken, (first)
Al:	No
⌜Jim:	Who's Ken?
⌊Roger:	He's more like uh Al and I.
Therapist:	That's Ken. (And that's Al.)

7:00

Roger:	's what you refer to as a hippie hheh He's been in it up to his neck,
Jim:	Yeh
Roger:	coupla times,
Ken:	heh heh
( ):	ough
⌜Ken:	Taste good?
⌊Al:	I— no I bit off the end of it I was chewing on the end of it.
Roger:	uhhm
Ken:	Bitchin!
Roger:	Havin, a big hassle with your folks.
Jim:	Yeah,
Roger:	Right. Daddy wants to keep you down.
Ken:	((cough))
Roger:	Mommy?
Jim:	Hm?
Al:	Good. Mommy you can tell what to do.
Ken:	((cough)) Goddam cancer.
Al:	See I told you. We know everything about this guy a(hh)lready.
Roger:	Ya have any brothers or sisters?
Jim:	No.

[1] Some 30 minutes earlier, Al has said: "We oughta go to someplace like Greece where they have a <u>king</u> y'know, an' challenge 'em with- like the Academic Counseling Center's <u>army</u> y'know, versus <u>their</u> army y'know,"

	Roger:	Daddy sorta sheltered you.
	Jim:	No, not really.
	Roger:	No?
7:30	*Jim*:	Not really.
	Al:	Y'sorta sheltered them.
	Roger:	Ya have a car?
	Jim:	No.
	Ken:	((gasp))
	Al:	Uh oh. One point against // you.
	Roger:	You hadda car?
	Jim:	Nope.
	Roger:	You want a car?
	Jim:	Oh hell yes hehh
	Al:	You've stolen // a car
	Roger:	Daddy doesn't want you to have one.
	Jim:	No, he wants me to have one, my old lady doesn't heh
	Roger:	Oh! Main conflict with mother.
	( ):	whhhhhh
	Jim:	Yeh
	Al:	heheh
	Ken:	hehheh his
	Roger:	Mother is too dominating.
	Jim:	Yeah.
	Ken:	But you been had already fella hehh
	Jim:	Mm hm
	Al:	Ok.
	Roger:	Bring your mother in we'll work on her hahh
	Al:	hehhehhhh
	Jim:	Ok heh
8:00		((pause))
	Al:	What are you thinking, old man?
	( ):	heh heh
	Therapist:	hahahh I'm thinking Jim has certainly had it. Heh
	⌈*Roger*:	Whip out your pad– Now, now, now– whip out your pad and write down what we say. Hehheh Take dictation.
	⊢*Therapist*:	(He hasn't been here) five minutes and you guys–
	⌊*Ken*:	You gotta pardon these guys they're all they're all the uh // social– social outcasts of the world.
	Al:	I'm vicious– I'm vicious, he's vicious–
	Roger:	This one's chicken shit, he's a bastard, I'm a mau mau.
8:30	*Al*:	Ok good. Now we're all settled, what are you.
	Jim:	(Well I–)
	Ken:	You a hood?
	Roger:	This is an abnormal session, // see we're not together without the broad.
	Jim:	Yeah.

Jim:		Yeah.
Al:		See we gotta have the broad here cause she– she unites us.
Ken:		heh heh She– she // unites us yeah
Roger:		She sorta keeps us on the road to some // uh meaning.
Ken:		She keeps us on the road heh table's always ready and heh
Jim:		heh heh
Roger:		Oh well
Ken:		heh heh
Al:		Oh well you know that's the way things go,
Ken:		heheh
Al:		That's the way it l– that's the way things lie down, y'know
Ken:		Hey–
Roger:		He sorta keeps his mouth shut and writes down things whenever you say something important.
Ken:		Yeah.
Al:		And– and then if you ask him to do something // you have to pay him though.
Roger:		He's a good guy, though.
Jim:		Ok.
Al:		Y'know

9:00	*Roger*:	Eventually you'll become sane.
	Ken:	heh Yeah which is–
	Roger:	Or your mother will, which is // not what you think.
	Jim:	Yeah.
	Jim:	I hope so.
	Al:	But uh
	Roger:	You're not // crazy, it's your mother huh
	Al:	It takes about– I've been here for four months you know and it's– it's getting better now I used to think that I was a bird'n used to fly you know but
	Roger:	Yeah he used to walk out on us y'know he thought he was above us.
	Al:	Yeah but now I'm– now I'm below you.
	( ):	hehh
	( ):	heh heh
	Roger:	See I corre– I corre– I corrected that fault. Hehhehh I gave him an inferiority complex.
	Al:	And I got him to shave.
	Roger:	Yeah
	Ken:	ehhehh
	Roger:	I'm not grubby or nothin'
	Jim:	N(hh)o
9.30	*Ken*:	heh Hey this is– this is the Academic Counseling Service it's called the family– family circle.

Roger:	It's not really a– an Academic Counseling Service // it's sort of a drive-in nuthouse. hehh
Al:	Then your father comes in here–
Al:	hehhhhehhahaha Then you rent you– then you rent a counselor. Five dollars an hour and fifty cents a question.
Roger:	Don't consider this one but on the whole you'll enjoy 'em. Fact it's a good way to spend Saturday morning.
Ken:	heh hehh
⌜*Roger:*	If you're stupid.
⌞*Al:*	After Friday night.
⌜*Roger:*	The morning // after the night before.
⊢*Several:*	((laughter))
⌞*Jim:*	Yeh
Several:	((laughter))
Roger:	After a coupla // cups of coffee you're alright.
Jim:	( )
Jim:	Yeah.
Ken:	Couple dozen cups of coffee.
Al:	Chew a cigar now and then, and . . .
Roger:	I don't smoke.
( ):	whhhhh
10:00 *Ken:*	( )
Al:	(He just // started last night.)
Jim:	–just eat it.
Ken:	You gotta believe– you gotta believe it we're the only two in here that smoke other than him.
Roger:	Doesn't Lu smoke?
⌜*Ken:*	No,
⌞*Al:*	No she doesn't smoke. She said she used to.
Roger:	She's a good gi(hh)rl ahhhaha
⌜*Ken:*	She– even–
⌞*Al:*	(She like she eats it)
Ken:	She smokes cigars that's about all,
Jim:	I see.
Al:	They smoke, I chew 'em.
Ken:	He eats it.
Roger:	's well chewing 'em's half the fun (I belie–)
( ):	hehh
( ):	heh
Roger:	Uh oral gratification or something heh
( ):	hehh
Al:	Let's see what else can we tell // him ( )
10:30 *Roger:*	They say that's why bubble gum and that shit's good– uh so popular y'know
Ken:	Why?

Roger:		There's a trend to uh put things in your mouth like thumbs, y'know
( ):		heh
Roger:		No really.
Several:		((laughter))
Roger:		No! Well why do you think babies // suck their thumb and adults chew gum and smoke everybody wants to keep something in their mouth.
Jim:		(Mmhh)
Al:		Well you know // ( )
Roger:		No, I'm not talking about eating or nothing, and I'm not talking about what you're thinking of either
Several:		((laughter))
Roger:		No really I read it in some book y'know
Several:		((laughter))
Al:		((cough)) Oh c'mon // aheh hehh
Roger:		It's really the truth!
Al:		One more // thing
Roger:		Look at 'im. Look at 'im suckin on that pipe all goddam morning hehh
11:00 *Al*:		He sucks on his dentures too! hehh Now listen one– one more thing. There's people watching us now. They got a tape recorder and they record // (everything)
Roger:		(That is the) microphone. Occasionally there's somebody in there judging us. They're baby headshrinkers. They're learning how to be,
Ken:		Don't worry // about 'em they destroy the tapes // afterwards.
Roger:		–what he is.
Al:		He's not quite one. He will be one in two months.
Roger:		'sright.
Al:		He's writing a // (whatchacallit) article.
Roger:		(a paper)
Roger:		(But today–) Yeah. But today we're not being uh viewed. We're just being taped.
Al:		No we're being viewed there's somebody in there cause they lit a cigarette.
Roger:		But he's blind.
Ken:		Hey don't worry about it,
Jim:		How c– how c'd you see him?
( ):		(Well)
11:30 ⌈*Al*:		It's– $\frac{(they)}{(he)}$ can see us, but you can't see–
⌊*Roger*:		That's not a mirror. // When you turn the lights on y'know
Jim:		The see-through kind? // Yeah.

Roger:	Mh. See it's darker in there. // I think.
Jim:	Uh huh
Ken:	Wave at him he's a nice guy.
[*Al*:	Anything else, Roger?
Ken:	They give parties.
Roger:	And if it gets private we can always shut the curtain.
( ):	heh heh
Jim:	heh great.
Al:	Anything else Roger that you think we oughta let him on– in on, or tell him?
Roger:	Nah
Ken:	We're all nuts?
Roger:	Let him slide for a few weeks.
Al:	(hh)Ok.
Roger:	Get the hang of things hehhehh
Al:	Then we'll really go after ya. Then when you know when we get–
Roger:	We'll let you rest with your problems now.
12:00 *Al*:	We've told ya all your problems now you gotta rest with 'em then // we'll then we'll then we'll tell you how to solve them // and you'll pay us off.
Jim:	Yeah.
Roger:	You gotta get warmed up to it
( ):	((cough))
( ):	Yeah.
Roger:	and vice versa.

Lecture 04.a

An introduction sequence

The data that we'll be by and large considering in this lecture can be found in the middle of the second page of the handout.[1]

Roger:	On Hollywood Boulevard the other night they were giving tickets for dirty windshields. ((door opens))
Jim:	hh
Ther:	Hi, Jim // c'mon in.
Jim:	H'warya
Ther:	Jim, this is uh Al,
Jim:	Hi
Ther:	Ken,
Jim:	Hi
Ken:	Hi
Ther:	Roger.
Roger:	Hi
Jim:	Hi
Ther:	Jim Reed.

Now we'll start to pick away at this a little bit. We can start out by noticing that *the sequence in which the introductions are done* is not, itself, a disorderly fact, i.e., it is not a random matter. There is probably only one crucial place in the determination of the sequence in which the introductions will be done, and that crucial place may well be noticed via the "uh" in "Jim, this is uh Al."

You might consider, if introductions are going to take place, and the therapist is going to do them,[2] what the import would be of various ways that

---

Lectures 04.a and 04.b consist of two lectures given in Fall 1966 (lectures 1 and 2) and again in Spring 1967 (lectures 6 and 7). They deal with matters that are not discussed in the Spring 1966 lectures, but they have been placed where they would belong in the sort of progression through the data that Sacks used for the Spring 1966 lectures. While the discussion contained in lectures 04.a and 04.b is misplaced, it is not altogether anachronistic, since the later Fall 1966 discussion is not the first mention of these matters. There is a brief consideration in Fall 1965, lecture 3, at p. 148

[1] In Spring 1966 a new transcript was produced, and the names Mel, Joe, and Henry were changed to Al, Ken, and Roger, respectively.

[2] The unedited segment runs off differently: "You might consider, if introductions are going to take place, and *this fellow Dan* is going to do them. . ." [emphasis

he would go through the three persons he's going to introduce Jim to. Obviously there's more than one way he could proceed through those three persons.

You could ask, for example, if we knew the first that he had done, could we then predict the second and third? And in such a way, now, not that we would be right, but where, if we weren't right then something of interest would be present. That is, either we'd be right, or if we weren't, then we might well be on our way to explaining, not that we were wrong, but that something strange took place. Such a question is possibly relevant, insofar as for the participants to the 'introduction sequence,' while perhaps they couldn't predict who would be introduced first of the three, they could feel assured, given the first, if they hadn't been picked then they would be second or third; for example, be 'prepared' to be second. We're talking, then, of some way of proceeding through what would be seen by them to be a sequence which, while it might have alternative ways of beginning, given a beginning it would then have correct ways of proceeding. And, perhaps not any beginning would be correct.

It's also the case that not only should that sequence go in that order, but it should go to completion. Introductions go in rounds. That is, not only might there be the possibility to predict whether one will be second or third, but one might predict that there would *be* a second and third, given a first. The rule that said 'do an introduction here' would also say 'do a round of introductions here.'

The idea is to see whether there is some oriented-to orderliness in that actual sequence. And in this case it would seem that the ecological distribution in the room presents proper alternative sequences. That is, the seating is arranged in a rough semicircle with the therapist closest to the door, then Al, then Ken, then Roger. When Jim is introduced, he is standing near the door. If the therapist begins with Al, he would expectably proceed to Ken, and then Roger. But not, e.g., Al, Roger, Ken. And if he begins with Roger, he'll go Roger, Ken, Al, but not Roger, Al, Ken. Further, he wouldn't begin with Ken. In that regard, then, it might be that 'Al, Ken, Roger' or 'Roger, Ken, Al' would be equivalent, but all of the other possibilities would be different.

---

added]. In contrast to the pronominal changes discussed earlier (Fall 1964–Spring 1965, lecture 2, p. 18, n. 1 and Appendix A) as matters of policy, the change from "this fellow Dan" to "the therapist" runs acutely counter to editorial policy. The policy was to preserve just such references, as is, in line with Sacks' deep concern with the issue of category-selection. This lapse from editorial policy occurred in response to an anachronism which cropped up in the editing process. Most roughly, text from a later lecture was introduced into a set of earlier lectures, the earlier lectures having been produced by reference to a transcript designating this speaker 'Therapist,' that designation having been introduced by Sacks in his 1965 transcript. The text in question, however, had been produced by reference to a new transcript designating this speaker 'Dan.' The incongruity was resolved by using the term appropriate to the earlier lecture series and its transcript, i.e., 'the therapist.' For a more elaborate discussion, see Appendix B.

Any one of these alternative possibilities might be informative about the set of persons; e.g., if one wanted to point up the fact that, say, Ken was a distinguished person in one or another way, then one might well begin with him. That is, the sequence is usable to present various kinds of information to the recipient, and to the other parties. But the activity can also be done in such a way that no such information is present, or considered to be present or to be used.

If the series goes 'Al, Ken, Roger' then we might suppose if they were seated in other ways than that, e.g., Ken, Al, Roger, then the introduction would go 'Ken, Al, Roger.' That is, the actual order seems to be partially independent of *who* happens to be seated in each position. Rather, they are seated in positions relative to each other which can be used to produce an observably orderly sequence. If the order 'Al, Ken, Roger' is used, then there is no suggestion, apparently, that Al is the most significant person present, but parties can see that Al's being picked first is a matter due to his having been seated there; they can see that if Al were seated elsewhere, he wouldn't have been first.

Now that's a matter that one wants to be somewhat attuned to. After all, Al *was* picked first, Ken second, Roger third. That they can see that it's not 'Al' who was picked first, but 'the person who is sitting where Al happens to be sitting,' would be of some importance if it could be an issue that some sequence would have another interpretation, e.g., that Al was picked first because he was the most important.

The data, the actual talk, can bear alternative ways of being seen. It is perfectly compatible with a view that provision for who was picked first, second, third, was made by, e.g., the social status of the parties and not by virtue of the ecology of the room, especially if the data were to be used by the parties to it, to find out what, really, their positions are in this group. I take it, however, that with the whole sequence available, one or another of these alternatives is decidable on. That is, for the seating order 'Al, Ken, Roger,' if the introduction went off, 'Al, Roger, Ken,' then Al might well be able to figure that he was picked first not by virtue of his position in the room, but by virtue of something else. That is then to say, that to determine what it is that was operative, requires that several occurrences be seen to be 'a sequence' in the first instance.

One wants also to see that it may well be that adequate decisions could be made as to what the therapist is doing with that sequence, with only that sequence available. That is, on a single occasion and without discussion, it can be available to participants that, e.g., ecological positioning is being used to order the sequence, or that someone is being selected via social status, etc.

I go through this for what could be fairly obvious reasons. One of them is, one might have the idea that the way in which some rule is to be detected is by, say, collecting some 10, 100, 1,000 sequences of introductions and plotting them in various ways, and if you seem to get a very good fit then you figure there is a rule, and if there is not, then there isn't a rule. What we have to find is, if someone can be adequately insulted or adequately commended by

a single introduction, then how that could be done becomes a problem that the data has to be handled to provide for.

Etiquette books give various rules for doing introductions and sequences of introductions, and they seem to suggest that one can bring off 'picking somebody out' or 'not picking somebody out' on a single occasion of doing introductions. Persons can see that they've been properly selected to be 'introduced first,' or, for that matter, that they've been neglected, without having to, e.g., collect several introduction series by the same introducer to see, e.g., how often they came first, how often seventh, etc.

Now, there are also kinds of consistency constraints on what it is that goes into a given sequence. For example, when persons are introduced to each other, and say more than 'hi,' it's not just that you have to make some identification because the last person on the list made some identification, but that the kind of identification they made is criterial for the kind that you make. That is, roughly, you find persons sticking within a single device when some sequence of identifications are being done. If the last person has said where they come from, then you will say where you come from, etc. And that suggests something that we want to watch for – the possible relevance of who goes first on a round, in setting up what it is that will be used. That can matter a great deal, obviously, since some people are 'better' at some things than other things – they have a longer lineage, or they have a better job, or they live in a nicer neighborhood than most other people. And that may matter as to which they want to put into an introduction. Given the way a sequence runs off, whether they get a chance to use their item is another issue. And that consistency constraint holds for names, as well, to some extent. So that the fact of a first name, nickname, etc., being used throughout the sequence can be quite informative, and it can be even more informative if differences are involved, i.e., if the therapist had said "Jim, this is Al, that's Mr Kenneth Goss, and this is Roger."

Given the fact that the kind of name used is a rather important matter and has a series of significances, we can stop to consider briefly a matter that I and one colleague of mine have an enormous fascination with. And that is the sort of thing that could be seen to be going on in the interchange:

Therapist :   Hi, Jim // c'mon in.
Jim :   H'warya

which, from the point Jim starts up, gives us "Hi Jim," followed by "Howarya." Is there anything interesting in "Howarya"?

First of all, "Hi, Jim" is a 'greeting' consisting of a version of 'hello' plus a name. Now "Howarya" is not directly a 'greeting,' but it's a 'greeting substitute.' Greeting substitutes can go where greetings go.[3] And "Howarya" can then go where greetings belong. It can go in first position or second; that is to say, to begin off a conversation which properly begins with a greeting,

[3] See Spring 1967, lecture 8, pp. 554–5.

instead of saying "Hi," you can say "Howarya." In this case, that it is second is of some significance. And that is because routinely a greeting accompanied by a name is followed by a greeting accompanied by a name. "Hi Jim," "Hi Mac."

Now, in certain circumstances, giving or not giving names can be a fairly significant matter. And in this case it could well be a significant matter, in the following way. This guy is a new member of the group. He probably knows the therapist as Dr so-and-so. That is to say, in the prior company in which he's spoken to the therapist, say, with his parents or whatever else, presumably that is the way they've talked. And in any event it may well be an issue as to how it is that he's going to address the therapist: Dr, Mr, last name only, first name only? It's not only an issue of their private relationship, but it's now right at the beginning of his presence among a bunch of other guys. And his choice is something that they see. They presumably have some way of dealing with that name problem. He doesn't know what it is. If he comes on with "Hi, Dr so-and-so" and they call him something more rough and ready, then he may well already have been seen to be a kind of pansy of sorts. That is to say, for somebody who is in a situation where they're watching somebody address another, the kind of address that's used right off is informative for them, about what relationship holds, about what sort this one is, that one is, etc.

Now, for one, with "How are you," the fact that there's no name doesn't make a problem of who it's talking to. It is directed, by virtue of coming in response to the greeting, back to the person that did the first greeting, the 'you' being that person. Furthermore, as a 'standardized item,' 'portable,' an 'idiom,' whatever you like, 'How are you' is complete on its own. It does not lack a name, which would be lacking in that sense if he just said 'Hi' in return. By using "How are you," then, instead of directly a greeting, the issue of a name is avoided.

And it's not merely that he doesn't make a decision on what name to use, but the fact that he isn't making a decision is not apparent in any obvious way. He hasn't simply addressed the fellow "Hi [no name]," i.e., in that sense not making a decision, but he's built something which doesn't need a name. So, that he is avoiding the decision on a name is something that need not be seen, and perhaps can't warrantably be seen. This phenomenon of no-naming people is a big issue, and a range of techniques for doing it are available.

Let's turn to the way that this talk comes off. I've talked about a 'sequence of introductions.' And the question is, is that just the way I'm talking about the fact of three introductions? That is, there were three, I'll call them a sequence. Or is there anything about it that provides that 'sequence' is a more useful way to go about noticing what's going on than saying there were three introductions.

Let's look again at the language here. "Jim, this is Al, Ken, and Roger" says the therapist. In its fashion it's a terribly interesting piece of talk. The first thing you want to notice is, it's one sentence in which room is apparently left for insertions of greetings by the various parties introduced. We don't have

something like, "Jim, this is Al." "Hi." "Hi." "Jim, this is Ken." "Hi." "Hi." "Jim," this is Roger." Instead, the second and third introductions are tied to the first in quite clear ways, leaving aside the mere fact that they happen to be in a sentence. What's involved here is that they're not only involved in a sentence, but that for the second or third to be seen as introductions, attention by the parties who are being addressed in those is necessarily directed to what happened before. So, for the word 'Ken' to be seen as an introduction of Ken to Jim, involves the fact that both Jim and Ken will have been attending "Jim, this is Al," to see 'Ken' as an addition to that.

One of the ways in which that is obviously of use to us, and something that it took me rather a long while to get the importance of – and I can't give it here in full, I only want to suggest it – is that we have a multi-party conversation going on, and a question we could ask is, what's the status in a multi-party conversation of persons who are not addressed by some utterance? While persons who are not addressed directly are not 'overhearers' – in the sense that in a two-party conversation a third person, not addressed, if it turns out that he was attending, then he would be doing something wrong – what are they? Do they have, say, rights to listen in because it's in their presence and they're properly present? Or do they have a *business* to listen in because what's being done to the one being addressed is also in some sense being done to them? Where their participation in the things that are addressed to them will have required that they have attended what has been said to somebody else in between utterances addressed to them.

In that regard, we can imagine in the first place that there is the question of what a 'group therapy session' consists of. Is it, for example, a set of private discussions between two persons, where, when you're not being talked to or you're not talking, you shouldn't really listen because it's somebody else's troubles that are being talked about? One thing that's going on here, then, is an invocation of the fact that in a conversation like this, if you're not talking or being talked to directly, you're not to behave as one who would be conceived as 'overhearing.' But in these conversations you listen to talk which is not addressed to you. And aparently you can be held responsible for that talk, in the sense that it may be assumed that you know what's gone on, which hasn't been between you and somebody else.

So, in this case, for Ken to see what has been done with "Ken," involves him in showing that he saw the first introduction, and saw that the form 'this is. . .' remains available for his name to be attached. And not, for example, that "Ken," is something addressed to him independently of what has been going on that was unaddressed to him, where, then, "Ken," might be a signal for Ken to say "What?" or things like that. The same, of course, goes for Roger. Now Al doesn't say "Hi." I'm not sure whether he did some greeting, e.g., by nodding, waving, etc., or just didn't do a greeting and was treated as having his time passed by the therapist who just went on, rather than, say, waiting Al out. From the rest of the material that we have, I can say that not giving a greeting isn't something that's beyond Al, but I just don't know, and nothing is going to be claimed on that score. In any event, the second and

third names are not, except by virtue of their position as second and third in a sequence which starts with "Jim, this is Al," signals for an exchange of greetings. They're quite equivocal as that.

And in that regard there's another thing that is, in its fashion, quite minor, though in some ways it can turn out to be of larger significance, and that is, the acknowledgements of the introduction are done with the term 'Hi.' What's the character of 'Hi' in that use? That its use does acknowledge the introduction, turns only in part on the fact that 'Hi' can do that; it turns also on the fact that it's 'an introduction' that's taking place. For in the first instance 'Hi' isn't a term which would be said to be, among its predominant uses, that item by which you acknowledge an introduction. It's a 'greeting' by and large. Though again, it's not always only a greeting, in the sense that it's not merely doing a greeting in this case.

What it is that a given term is doing, is something that may well require some analysis of its locus in conversation, to find and to argue. (In the case of 'greetings' it may be very simple, but I'm not sure it's all that simple.) And in that sense, then, the specification of the uses of sets of terms require a formulation of the structure of conversational possibilities. And if that's so, then we wouldn't suppose that the most convenient form for a presentation of the properties of the language would be a dictionary. Rather, perhaps, some form of sequence functions of a conversation, with various items included in them. It would be hard, unless you knew 'Hi' was 'a greeting' to locate what 'a greeting' would be, via a dictionary. Whereas, if you had a sequentially organized thing, if you knew what you needed you could see where to find it. And you might also not be led to focus on the notion that there are a set of alternative meanings for that word. That notion is an artifact of an orientation to a dictionary-like object.

With data like this you can also see something which may be quite general, and if it is of some generality it will be a helpful sort of fact in resolving various puzzles. And that is, for the second introduction to come off as 'an introduction', that there was a first, seen as 'an introduction' by its participants, is sufficient to allow a rather different form to be used. "Ken," is all that's used to signal that the second introductions have taken place. That is to say, the item 'second introduction,' to be seen as having been done in the way it was done, is contingent on there having been an observed 'first introduction.'

If, given something that can come in sequences, a 'first' has been seen and oriented to, then a 'second' can be done observably, without using that form which would be required for a 'first.' That is to say, if the therapist had simply said "Ken," as a first, then what he was doing would not at all be clearly an 'introduction.'

Here is the sort of thing that this phenomenon, if it is more or less general, might clarify. It's taken to be the case that there are various markings for questions, e.g., rising intonation, a special grammar, inversion, etc. It has also been suggested that an enormous number of observable questions have neither 'question intonation' or the grammatical form of questions, and yet

seem to be recognized as questions. How would that be done? One possibility might be, if a 'first question' has been recognized, then things which go after its answer can perhaps be inspected for whether they're 'second questions.' And those can perhaps be made without use of those things which would mark a 'first question.' In the data there are long sequences of things which are treated as questions by the hearers of them, but where, increasingly into a series, you just don't get the markings which would in isolation show that those were 'questions.' Just as you don't get the markings for "Ken," that would show in isolation that it was an 'introduction' though "Jim, this is Al" would be so seeable. And with respect to names in series, it's a regular thing. For example, if you're offering candy, then you can perfectly well use this kind of form: "Would you like a lifesaver Mary?," "Bill?," "Harry?" etc.

So then, first items in '*serializables*' may have special status, and also, that you are making 'a series' can then be done by doing as a second, something which is not independently seeable as such a thing, but is so seeable given the first.

One thing we can come to see is that producing the introductions in the form of a sentence might specifically be done to make available to Jim that 'a group' is being presented. That is, we want to differentiate between Jim being introduced to 'three people' in close order, and Jim being introduced to 'the group,' one by one. In that regard, it seems to follow that sentence-making is to be conceived as a kind of social institution in perfectly conventional ways. I suppose we don't ordinarily think of the use of grammar as a social institution for demonstrating organization. Courses in social organization don't have, I suppose, sections on the way you can build sentences to present a group, where you use the resources of the grammar to do that. But it might not be a bad idea.

It isn't, then, that we have sentence-making on the one hand and social structures on the other, and one can study their relationship by, e.g., studying dialectics. But you can see that if we can propose that an introducer could go, "Jim this is Al," "Jim this is Ken," "Jim this is Roger," then the responses of second and third persons would not show that they were attentive to what had preceded, and furthermore, talking about them as 'second' and 'third' would have no specially strong basis. So the very sentence that's used to make the introductions does it specifically as 'a round of introductions,' involving all the parties in seeing it as 'a round of introductions' in order for them to perform its various parts.

We can also notice that, as in the case at hand, names used in introductions seem to involve the doing of an instruction to the parties concerned, as to what they may call each other. And that makes the matter initially interesting, in that we could then ask, "How does A get off telling B, C, and D what they should call each other?" Where it's perfectly plain – though of course it will have to be dealt with itself – that not anybody has any right to call anybody else any particular name they may choose, of the various alternative ways that names are used. I once asked a class to sit down and write out, over a day, what versions of their name they were called. And they found, first of all,

considerable orderliness to that, but by no means that they were called *a*
name. Nor did they figure that the various persons on their list could
interchangeably use the various names that were used by one or another
person. And not only could X not pick up the name by which Y called you,
but that you could not insist that X do so if you wanted to. And this is apart
from issues of the way in which what name they call you is or is not
informative about what name you should call them.

That the doing of naming here is also the doing of an instruction is most
interesting because it involves two different issues. One of them turns on how
you can go about doing instructions. The other is, is it generic that whenever
persons do 'naming' they're also doing something else? Perhaps, indeed, that
they do 'naming' involves a procedural rule which says, 'When you find that
they're doing "naming," look, then, for something else that they're also
doing.' That would have some considerable consequences.

In that regard, let me just note that we're getting here, not merely an
instruction, e.g., for Jim how to call Ken and for Ken how to call Jim, but
a presentation for all how to call each. Each usage is instruction not only with
regard to its participants, but also in some way to the others, where the use
of names in multiparty conversations is something which is to be considered
differently than the use of names in two-party conversations. That's obvious
in certain ways. Persons modify the names they call each other in two-party
conversation when they are in a multi-party conversation. Furthermore, they
might refer to somebody in multi-party conversation differently than they
might in two-party conversation. Now in doing that they might perhaps be
taking account of the instructional use of names, and also, of course,
controlling the kinds of information that can be gotten about the two parties
concerned. That is, e.g., if you overhear two parties, and they use one or
another name to each other, you can make interesting guesses about their
relationships, and one of the ways they can intend to conceal that sort of thing
is by the kinds of names they use to each other 'in public.'

I want to deal, now with a problem which we can call the 'sufficiency of an
identification' problem, the issue being: Are names sufficient identification, or
is it the case that, given a name, some other identification is thereby made
relevant? And it does seem that names provide for the relevance of other
identifications. In this two-hour group therapy session there's a couple of
places in which names are offered. For example, earlier the entrant's name is
mentioned in a sequence that goes:

Al :   Where's Jim Reed?
Ther :   Jim Reed will be late.
Roger : Who's Jim Reed?
Al :   New guy is coming.

I suppose if names were sufficient identification, an appropriate answer to
"Who's Jim Reed?" would be, 'Jim Reed is Jim Reed, who else could he be?'
Or, if the question had been formed up as 'Who's he?' then the name could

be returned. In this case, the answer is, "New guy is coming." At another place somebody else is mentioned:

Ken: How has Fido across the street been treating you?
Al: Oh you mean Bitch Hazel?
Ken: Yeah heh
Roger: Who's Fido?
Ken: 's Hazel.
Al: Bitch Hazel across the street a waitress.

So, "new guy" and "a waitress." And it is of course routinely the case that in the beginning of first interactions, the exchange of names is accompanied by the exchange of other identificatory items.

Let me make one caveat to the remark that further identifications are appropriate: It is perfectly conceivable that although only names have been used aloud, the very structure of interaction is sufficient to provide that some other identifications obtain and are relevant, so that the exchange of names will have informed those present about both the relevance of some other identification, and the findings on those matters.

This can have to do with, for example, what it is in the first instance that might be known about any one of the people involved, so as to use that to find other things. So, one possibility is that what Jim, the entrant, knows is that the guy who says "Hi Jim, come on in" is 'the therapist,' and that there are also 'patients' present. The fact that he's introduced to the three other guys may be perfectly sufficient to tell him that they are, indeed, 'patients.' And it may be perfectly sufficient to tell them that he is, indeed, 'the new guy.' So it's then perfectly possible that the relevance of other identifications are given to the various personnel present via, say, who greets who and who does introductions, even though none of them are laid out directly. If that were so, then the relevant identifications would vary with any given occasion of greetings and introductions taking place, i.e., you wouldn't say that any time somebody introduces three boys to another, then the one doing the introducing is 'the therapist' and they are 'patients.'

That being the case, we haven't made a trivial remark because it would have to be an issue that all of them decide what the import of that fellow doing the introductions is, i.e., what he doesn't have to say out loud. That then makes the greeting-introduction sequence of possible significance to the issue of other identifications than those explicitly used. And that has one consequence methodologically which is, you couldn't then say 'You're wrong about the appropriateness of further identifications if there are some circumstances where they didn't happen to occur.' You might find a place where they didn't occur, where analysis of that case would show that the structure of the introduction did that work. Though the question of how it did it might be another issue.

One import of that fact, then, is its relevance for the question of what it would take to show that a piece of analysis was wrong. And one thing that

won't do is some totally unanalyzed piece of interaction used to claim that some possible rule, for example, was 'wrong' by virtue of that piece of interaction not doing what the rule states. You must have been making findings about that piece of interaction to propose that it controverts a proposed finding.

Lecture 04.b
An introduction sequence (ctd)

I'll continue picking away at this introduction sequence.

Ther:	Jim this is uh Al,
Jim:	Hi
Ther:	Ken,
Jim:	Hi
Ken:	Hi
Ther:	Roger.
Roger:	Hi
Jim:	Hi
Ther:	Jim Reed.

Among other things, I made an extensive – if not labored – consideration of the fact that we could talk here of a 'round of introductions' having taken place. And I proposed that there was machinery which could be adapted to presenting, specifically, that a '*round*' was being done. That is to say, the way that that sentence, with its connections, comes off.

Now one might find oneself trying to figure out why it should matter much that we could have a notion of a 'round' which specifically, distinctively characterized some phenomenon; why, for example, we couldn't talk of whatever we pleased as a 'round' as long as, say, it might have gone to completion, i.e., there were three people that could have been introduced, and three people were introduced. Or in any event, if a somewhat picky notion of 'round' does characterize something, while that may be of incidental interest, what will it permit us to come up with?

I am prepared to present some consequences of it, but before doing so, I want to mention something that is not an altogether incidental sort of issue.

People often ask, 'Why do you choose the particular data you choose? Is it some problem that you have in mind that caused you to pick out this group therapy session?' And I'm very insistent that I just happened to have it, somebody had found this segment, it became fascinating, and I spent some time at it. Furthermore, it's not that I attack it by virtue of some problem I bring to it.

As we play around with what it turns out that we can get out of a notion of 'round,' one thing to see is that it wouldn't be supposed in the first instance that, had we such a problem, we would have taken this data – with which we come up with a solution for that problem – to consider that problem with in the first place. But it may be, as it seems to be here, that we can be attentive

to the possibility that some first-level analysis of a piece of data can set up another consideration which will turn out to address, say, some theoretical or methodological problems that we know exist in the field. And that is then to say, there may be some real gains in trying to fit what you can hope to do, to anything that happens to come up. I mean that not merely in the sense of 'pick any data and you'll find something,' but 'pick any data without any problems in mind and you may find something.' And how interesting what you may come up with will be, is something you cannot in the first instance say.

Now I adopt what is in a way a counter-strategy to the issue of 'interesting,' and that is that I'm specifically picking utterly uninteresting data. Things which do not have for us any special lay interest. That means that in order to find its interestingness we have to find that whatever it is that's interesting about it is what we can say about it. And we can then develop criteria of interestingness where we're not exploiting kinds of things we 'want to know about' – scandalous topics, gossip, etc. Things like an exchange of greetings are kind of ideal, rather than, say, the discourse of kings or salon conversation, where we know in the case of the latter that it's important and interesting, and it's very hard in the first instance to ignore 'what they say,' which you have to do.

Now, last time I talked about the introductions being brought off as a 'round' in a strong sense, i.e., discriminatively of saying 'three people were introduced here.' Once we have that strong sense of the notion of a 'round' at hand, we can of course note that some sorts of things *can* come off in rounds, others apparently are properly done *only* in rounds. For example, if you have some amount of candy that you might offer, apparently you'd better figure whether you have enough for any person present who might say 'Yes,' if you're going to make any offer at all.

Except that if that's the way things somewhat work, then you can use the phenomenon of a 'round' for some activities. For example, that offers ought to come in rounds provides that you can specifically mistreat people. That is to say, without 'doing anything to them' you can mistreat them by the not doing of that thing which is underway in an observable round. For example, Al, Ken and Roger are present, and if Jim offers some candy, "Would you like some candy Al? . . . Ken?" and then it stops, he is observably 'not offering candy to Roger.' So there are specific things that can be done by virtue of persons' orientation to the fact that some activities are properly done in rounds.

Now, leaving aside the issue of 'mistreatment,' when we consider that sort of thing we can arrive at a decent way of talking about something that social scientists always want to talk about, and it's at least my reasonable guess that they've never been able to talk about it in a strong way. And that is, how do you go about talking about *absences*. Something is absent. Something didn't happen.

In pretty much any extended anthropological or sociological discussion you'll find them talking about something that didn't happen. There's a

tremendously tricky problem about talking about things that haven't happened, and that is, if you're going to say some X hasn't happened, then there's an indefinite list of things that could be said not to have happened at that point. And if that's so, then your case is non-discriminable from the rest of those, and the observation is trivialized. 'Sure he didn't do X, but he didn't do A, B, C, etc., either.' And how do you go about locating, as a significantly sayable thing, that he didn't do, distinctively, X?

The issue of arriving at a discriminative notion of an absence – something that didn't happen – is one that we should like to face. As Members in this society we after all know that people are always saying things like "Mary didn't come" or "He didn't hit me when I said this," etc., but it is only by knowing that you can do such things that you accept such statements as reasonable. If you required that they be defended, they couldn't be.

What we can perhaps do is see whether there are some methodical ways that persons arrive at such noticings. In the first instance, they don't go around saying, e.g., when characterizing who was at a party, 'X was there and Y was there,' and then some list drawn from a telephone book to say who was absent. Or, 'He did X and he did Y', and then some list drawn from a dictionary to say what he didn't do. There are some occasions under which absences are noticed. If we can characterize the bases for them, we can come up with a usable notion of 'absence.' And such a notion could perhaps be generalized beyond the specific occasion that we happened to construct it in relation to.

That is to say, if it's the case that something appropriately goes in a round, and what is observably a 'round' has begun but is not brought to completion, then, that something was 'not done' is noticeable, and the specific thing not done is noticeable; for example, that Roger was not offered a piece of candy, or that Jim was not introduced to Roger. Then we can see how it is that persons can come to talk non-trivially about absences.

Furthermore, it might be the case that what was being done with that thing not happening is also observable. That is to say, it's not merely the case that somebody can apparently say that Roger wasn't offered a piece of candy, but that they can say what was being done with Roger not being offered a piece of candy. There is, in that regard, material which consists of people remarking on it e.g., 'How come you didn't offer me any?' And such things might permit us in some cases to get at what sorts of things come in rounds. So, for example, in our data there's a place where they're telling jokes. Al tells a joke. Ken tells a joke. After a while Roger says "How come I never remember any jokes," i.e., he sees that he 'hasn't told a joke' and remarks on it.

And jokes do come in rounds. Now, jokes and introductions and offers, i.e., things that come in rounds, seem to have a feature in common with something that's partially related to rounds; that stuff I was talking about last time, on firsts and seconds, where we could come up with a decent notion of 'second' independently of saying it happened to be number two, i.e., via modifications in the way that a first thing got done. A first joke – what turns out to be a 'first joke,' we could call it a single joke – may get introduced,

"Hey I heard a joke. Wanna hear it?" Second ones routinely do not get introduced that way, but by "Here's a good one," "Here's another," without that it's going to be a joke being specified. And that, then, is getting done in the same way that, that this is a 'question' is not seen independently of the fact that a series has been started, or that this is a 'second introduction' is not available but by virtue of the fact that there was a first to which this has been fitted. And it may be that non-trivial absence is not restricted to phenomena that come in rounds, but that there are other ways that relevancies are set up such that, that something didn't happen is observable.

Once we come up with how, e.g., properly-rounded actions can permit us to see 'absences' in controllable ways, we might be able to abstract from that other ways that absences are, in parallel to our first cases, also observable. That is to say, what's going on here is that if it's properly-rounded and a round has begun – say, a first and second have been done, and done specifically as rounded events – then a third is relevant and N is relevant until completion has been arrived at. And what we're dealing with, then, is *'contingently relevant events.'*

It may be that you can formulate classes of contingently relevant events independently of rounds, such that: Some prior thing has happened, and has happened in such a way that you know it's been observed as such, i.e., in the case of the 'introduction,' that an item was recognized as an 'introduction' was provided for by the greeting sequence taking place, which turns on an analysis of the 'Jim, this is Al' into an 'introduction.' You might find, then, that wherever you get contingently relevant events becoming relevant, you can find that absences are noticeable. And you can begin, then, to generate a fairly abstract way to provide for distinctively using the notion of 'absences.'

You may then find that a good deal of the sociological literature is not 'wrong' in the sense that it didn't use absences that way, but that it is specifically inexplicit and unknown. That is to say, it probably will often conform to an appropriate use of absences, but it didn't have what is essential, and that is the apparatus that will give us that usage of 'absences' – where it is our business to *analyze* how it is that something gets done, or how something is 'a something,' and not to *employ* it.

Se we move from this nothing 'introduction sequence' to a notion of 'rounds' which handles a lot of things other than introduction sequences, and then to a formulation of 'absences' which is, now, a perfectly conventional, recognizable 'problem.' Everybody who's doing social sciences wants to talk about absences. And, that we extract some stuff on absences provides in the end what's interesting about the introduction sequence. Now we didn't get it by especially saying, 'The next three lines of data I play with, I'm going to try to deal with absences.' And it's not that we couldn't have come up with a decent way of talking about absences on other materials. But it might well be other material which seems as irrelevant in the first instance to that issue, as this stuff did.

Let me now address this 'introduction sequence' with a different sort of question, concerning the fact of its placing, and what may be involved in that.

It is the first piece of talk after the entry of the new member. Now the fact that upon his entry this thing is placed, can lead us to considerations along the following lines. They were, after all, talking about something or other before he entered – automobiles, racing – and when this sequence closes, that topic is again picked up. Can we say something like: Under some conditions there are conversational possibilities which can be called *priority items*, or priority sequences, and they have *superceding relevance* over whatever it is that may be being done, or over some things that may be being done? It does appear that there are some 'priority items,' and they're priority items whose character is not given by the last thing that occurred, in the sense that given a question an answer may be a priority item, given a first greeting the second may be. But these seem to have rights and obligations to be done, perhaps without regard to what it is that has been taking place, under some proper conditions occurring. They don't have, in that sense, a 'place' in the conversation.

What I want here to point to are things like this: Suppose there's a rule that says: For some given person, upon the entry of some other specifiable person, the first ought now to greet them and introduce them to others that they don't know, if they don't know them. Now that's an 'instruction.' There are instructions of that sort written up in, e.g., etiquette books, and you may, in fact, get instructed by someone about such a matter.

There are several interesting things about such instructions. First of all, what are the ways that instructions directed to some determinable person out of a group, are usable or properly to be used by others in controlling their own activities? So that, for example, it may be the business of somebody, upon the entry of Jim, to greet him and introduce him. However, if we had a situation where the instruction had the character that it controls those to whom it's directed, then, for example, these fellows having been talking, they could go on talking. And treat, for example, the fact that the therapist starts to talk to Jim, as an 'interruption.' Now one of the characters of priority items is that when they are properly invoked they are not interrupting what goes on, and what goes on ought to cease. So that, for example, even if the instruction about greeting and introduction isn't directed to some set of people, they, in the first instance, apparently ought to orient to that instruction so as to allow it to get done. For example, to shut up, and perhaps in some ways to participate.

If the character of at least some instructions is of that sort, then the task, say, of sociologically rewriting instruction manuals could get at least an initial posing. That is to say, if you have an instruction manual that has a set of directed instructions, i.e., say, 'A host, upon the entry of invited guests, ought to do the following,' then those instructions are not secrets from other Members, but – crucial to their use – involve others seeing them and going through some analysis in which they treat the instructions as instructions for them also.

Now that doesn't mean that one can just take a set of instructions, where each instruction had a direction (to 'host,' to X, to Y) and now amalgamate all the persons and say, 'These are to whomsoever, everybody ought to notice

them and attend them in one or another way.' But presumably each of them has to be somewhat rewritten for each possible person present. The character of the rewriting involves at core, among other things, some means whereby upon, say, any priority item possibly being relevant, every person present has some way of engaging in a systematic categorization of the various personnel present, of locating among them 'the one who ought to do the priority item,' of doing what will allow that, e.g., being quiet or talking – indeed, of seeing that such an item is present so as to stop in the first place. Where we need some generalized results – unless we're going to get difficulties, i.e., that each person arrives at more or less the same determination of whose business it is to do whatever it is that's to be done.

And there's some curious aspects to the issue of who's business it is. The instructions in etiquette books tend to get written with some specified type of person, given some type of situation, e.g., 'The host at a party ought . . . ' There are presumably lots of occasions in which, say, introductions occur, for which there isn't a 'host at the dinner party.' The question then is, how is it that persons go about picking some class for which the set of integrated rules has been initially written, and replacing the various categories with some available set of categories, and assigning the new categories status with respect to the old, i.e., seeing who is 'like a host' or some such thing. Or treating 'the host' as an example from some other class that has some other form, i.e., 'the person in charge here,' or whatever. Where that person can find himself, and find the others seeing that he is the one, although he isn't 'a host.' Maybe. And all this is to be done in fairly short order.

So these 'priority items' apparently involve, then, some orientation to a set of identifications, where whatever the instructions are, they're usable by other than the one(s) to whom they're directed. And the results of whatever analyses Members go through to find who does this, are apparently not controlled by the fact that the instructions which weren't in the first instance directed to them, didn't in the first instance specify some person who happens to be there. That is, say there's no host here, but people can still find some way of locating that they are – and others see that they are – the one who should do this. And they can organize their activities so as to allow that, and to make it missing if it doesn't occur, and various other things.

Now notice one extremely important aspect of that. In the case of greetings and introductions, the analyses which provide for that set of concerting activities had to be made doable 'even though' – if I may use that phrase – the set of persons present don't all know each other. They are not doing it, in many cases, by virtue of having made some predetermination, or knowing each other's habits. In the case of introductions – and that's one of the interests in introductions – the whole apparatus has to be set up to be usable between persons who haven't met.

Consider the kind of import it has for some set of concerted activities, where it's crucial that they go off concerted, that there's a bunch of analyses that have to be done, which can be relied on, where the people who are generating the activities don't know each other in the first place. It is that such

things go on routinely that is the sort of thing that sociology in the first place picks up and focusses on – or ought to – when it talks about 'a stable set of social affairs' or whatever.

You can have, apparently, stability and orderliness where people don't know each other, and are doing things of an order that you could see easily enough if you tried merely to rewrite the instructions out of Emily Post to handle the five people in this group. And all that can be done 'immediately.' Time and time again. And that is to say, these are *ordered events on single occasions*. It isn't the stability which sociology is considerably interested in, which is gotten via summation of frequencies of occurrence. That isn't its beauty. That isn't what Hobbes, say, might have been interested in. It's that sort of thing that provides why one ought to be fascinated by a thing like this running off in five seconds – if five seconds is what it takes; it may take less. You're really seeing stuff with tremendous power at work.

Then there's this matter of 'priorities,' i.e., the kinds of analyses involved in locating the fact that such a priority event is now appropriate – where, of course, if one locates it and others don't, then the one who locates it may be heard to be merely interrupting, if other things are going on. And it isn't the case that it's simply a rule that says 'If any given person comes into a room, any room, and doesn't know all of the people present, they ought to be introduced to them.' If I'm sitting in my office talking to somebody, someone will frequently come into the room and say something to me, and I don't bother introducing them to the other person present, who may pause, talk after a while, various other things. We don't have a universal rule, which would make everything quite simple, i.e., a rule stating 'Any entry to a room immediately provides that this thing should take place.' Then you'd need no analysis.

It's a curious fact that situations in which something holds for 'everybody' are far simpler than those which don't have that character, but which hold 'for men,' 'for women,' or whatever. Because then people apparently have to locate what set of categories are appropriate, i.e., if someone enters who could be a 'man' or a 'doctor,' or something else, then the Members have to know that the device that contains 'men' is the one to be used. As long as it's not 'everybody' there's an issue of which device to use – and in the case of introductions, it's apparently a variety of different things; somethimes 'age,' sometimes 'sex,' or 'proper being there,' etc.

Again then: I made some remarks about 'instructions' which can have, perhaps, some tremendous generalizability in terms of at least the problem of dealing with instructions in general. One could ask on what basis could such findings have been made? You could imagine that in principle what one would have had to do to come up with them would be to consider a sample of instructions; for example, 'We have to take all the instruction manuals available in some game book, and analyze some common properties of them, see who they're directed to, etc.' Alternatively, it may be that we can come up with findings of some considerable generality by looking at very singular, particular things. By asking what it takes for those things to have come off.

Or, for example, would the sort of things that I've been saying so far be affected by a study which examined 100,000 random greeting sequences, and computed the sequences? Indeed, the point that one wants to notice is that one couldn't have done that, since by and large any such study would already have come to a definitive formulation of who was present, in some set of categories – 'male-female,' 'age,' 'social class,' etc., and those may be precisely the things at issue in this thing coming off. That is, that's what people have to find out in doing them.

Lecture 4
Invitations; Identifications; Category-bound activities

Ther:	Jim, this is uh Al,
Jim:	Hi
Ther:	Ken,
Jim:	Hi
Ken:	Hi
Ther:	Roger.
Roger:	Hi
Jim:	Hi
Ther:	Jim Reed.
( ):	((cough))
Ken::	We were in an automobile discussion
Roger:	discussing the psychological motives for
( ):	hhhhhhh
Al:	drag racing on the street.

The line I'm going to talk about this time is "We were in an automobile discussion." I will by no means have fully characterized it; that will take a long time and I'll keep coming back to it. My considerations here will be another instance of how it is I take it that we go about doing sociology and anthropology.

I want to propose that this utterance, "We were in an automobile discussion," at least were it to occur alone, is possibly to be seen as an *invitation*. I want to lay out the tasks that are involved in showing that that's so, and then to attempt to satisfy them.

We want to be able to build a method which will provide for some utterance as a 'recognizable invitation.' Two tasks – at least – are involved, and these two are closely related. One task is to construct what I'll call a 'partial definition of an invitation.' What makes it partial is that, while it's a way of doing invitations, it is clearly not all the ways. There are other ways, and those would be other partial definitions.

Now, we can have a perfectly good partial definition of an invitation which, however, wouldn't give us this thing as 'an invitation.' The second task, then, is to build a partial definition which provides for this to be a case of the use of that procedure.

That means, for the first task, that I could say, "It looks to me like an invitation, and I bet it looks to you like an invitation," but I wouldn't be able

300

to show how that's so. If that's the case, I don't establish my point. For the second task, I could also say, "Here's the way some invitations are done," and we could find cases that would fall under that, but not this one. That, again, wouldn't do what I propose to do. We want to do both: Construct a partial definition of 'invitation,' and one that provides for 'this is a case.'

And in the first place, we want a method that generates this line. We want it, however, to do the job of generating it as a case of an invitation. It's perfectly easy, and perfectly trivial, to construct methods that would generate this. We could use the spelling rules of English. We could say, "Divide the thing in half. First put the first half in, then put the second half in." That would not, however, tell us how whatever we get is recognizable as a particular activity – like 'invitation.' We want, that is, to construct a discriminative procedure for generating invitations.

Further, since invitations stand in alternation to rejection, what we would like is to discriminate between the two. We want the definition to provide for the recognizability of 'invitation' for some cases, and for the recognizability of 'rejection' for some. And if we get a method, then we ought to be able to use it to generate other cases than this one; where, then, the ones that we generate ought to be equally recognizable as invitations or rejections. With that, we have some idea of the tasks involved.

I'm going to focus, basically on the second part, the phrase "an automobile discussion," as crucial for our purposes here. Now, I've introduced the term 'category-bound activities.' I want to propose a relevance rule, and that is: If someone names – as, for example, what they were doing – a category-bound activity, that provides, first, for the relevance of the category to which the activity is bound. Then, by use of the consistency rule, the collection of which the category is a member is made relevant. So that by naming as the thing you were doing, some activity which is category bound, you provide the relevance of some collection of which it's at least the case that some particular activity is bound to a category of that collection.

And an automobile discussion is, I think, a category-bound activity, with 'teenage boys' as the category it's bound to. By naming the activity, one thing that we can say is being done is that an *identification* is being offered, of at least the speaker. That is, that with this formulation he says, "It is relevant that we are teenagers; consider us teenagers."

Essentially what I want to propose is that one way to make invitations is to do the following: If a new person comes into some place where there is some set of persons engaged in, for example, talk, then one of the pre-present persons can make an invitation to the entrant by using a phrase to start off with, like "We were doing," plus the naming of some activity that is something like 'category-bound' to a category which, once made relevant – and it's made relevant by the naming of the activity – can be seen convergently to hold for some part of the pre-present persons and the entrant. Alternatively, one can build a 'rejection' in the following way: Propose "We were doing" plus a category-bound activity, where the activity is bound to some category that characterizes the pre-present persons, but has the entrant

in an alternative category of that collection. For example, a man comes home. His wife is there, talking to a friend of hers. She says, "We're discussing the sewing circle." It's a rejection. He says "Oh excuse me." That is to say, that thing is bound to 'adult females' and he's a male. It provides for them as members, and not for him.

Now, it's perfectly clear that we could find this statement, "We were in an automobile discussion," when there wouldn't be an 'invitation.' For example, you get home, somebody says to you, "What did you do?" and you say, "We were in an automobile discussion." We need, then, a *slot* in conversation wherein items, if they occur there, can be recognized as invitations, if they are in the first place possible invitations. I want to propose that that point in a conversation after greetings have been exchanged, and at least a partial introduction, is a slot for an invitation. For one, that means that one can look to that place to see if something that passes as 'an invitation' has occurred there.

There are, in the 'invitation slot,' alternative but related things that can also go, and it's rather relevant to see that. Among them are things which we could call '*pre-invitation/rejections*' (with this term I intend that the thing can be either pre-invitational or pre-rejectional). The matter of pre-invitation/rejections and their use can be rather consequential, and I'll therefore quote a piece of data and its analysis from one of the extremely few studies of conversation that have yet been done; a book called *The First Five Minutes*, by Pittinger, Hockett, and Danehy. The quotation occurs right at the beginning of this five-minute segment of a psychotherapy session which they are engaged in analyzing.

> *Therapist:*   Will you sit there,

(apparently she sits there)

> *Therapist*:   What brings you here?
> *Patient*:   Everything's wrong. I get so irritable, tense, depressed.
>   Just everything and everybody gets on my nerves.
> *Therapist*:   Yeah.
> *Patient*:   I don't feel like talking.

The key line is "What brings you here?," and this is what they say about it:

> This is T's opening gambit. It would seem about as open-ended and non-directive as it could be made, and in many ways it is, as can be shown by comparing it with other possible openings, but in one respect it tips the scales slightly. Three of the four words in the sentence; 'what,' 'you,' 'here,' are what the grammarian calls 'substitutes' or 'shifters' or 'pronominal forms,' words the denotation of which in a specific context depends almost wholly on that context. Instead of merely 'what,' T

could have said 'what troubles' or 'what problems' or 'what difficulties.' The actual choice is obviously neutral. Instead of 'here,' he might have said 'to a psychiatrist' or 'to this clinic' or the like. The neutral 'here' allows P to define its reference in accordance with their own perceptions of the surroundings.

That's a very casual treatment, and I want to argue that it's all wrong, and the fact that it's wrong operates to prohibit them from seeing how the patient then comes to respond as she does, i.e., to say, "I don't feel like talking." That is, the doctor says, "What brings you here?" The authors say it's a very open beginning. I want to propose that it's a pre-invitational/rejectional remark, and quite obviously so. Things like "what brings you here" regularly occur. You walk up to somebody's office, walk in, say "Can I see you for a moment?," they say "What do you want?" That's not an invitation. You know at that point that now you say something, and they may then use it to decide whether they'll see you or not.

In a first therapy session, the troublesomeness of 'What brings you here' is much larger than the chance of losing whatever it is the interchange was to hold (that is, if the patient takes it that what she says next is going to stand as some sort of grounds under some analysis of it, for the therapist to decide whether he's going to take her or not as a patient, whether he's going to continue beyond this initial diagnostic interview), but, further, what it is that would be good grounds for him to take her is something she may not have any idea about at all. It's not enough that she's in one way or another troubled – that's obvious enough in that she's here. She could present a set of troubles which he could recognize as legitimately complainable about, and something to be cured – but perhaps not by him, or not now, or not in an out-patient status, maybe in a hospital. What it is that he's going to do, then, with an item she presents, is something that she, it's reasonable to suppose, doesn't know. And furthermore, if he turns her down after she's told him something, then she's perhaps given somebody information which they aren't entitled to have. That is, if he's her doctor, then her private troubles are something that's his business. If he's not, they're not. And if whether he's going to be her doctor is conditioned on what he makes of what she says, then, what she can tell him which can also control that she hasn't told him anything terrible if he turns her down, is perhaps a rather problematic set of materials.

Now, she accepts the pre-invitation/rejection by offering what could be good grounds for being accepted, and what she may take to be a sufficient answer. That is, answers to such questions as "What brings you here?" are regularly seen by the doer to be sufficient when finished, and, regularly, patients do, if they figure they can't deliver in an utterance what they take to be sufficient, say things like "Well, it's a long story," to provide that they can then at least go through that 'story' in its particulars. I take it, then that in this case she gives what she figures to be a sufficient answer. And it's rejected. That is to say, the doctor's statement, "Yeah," would then be heard as saying things like "Continue," "What else?," i.e., 'That isn't enough.'

Note what I've proposed about "Yeah" and its possible equivalents, and compare it with what is being proposed as possible alternatives to the opening "What brings you here?" (e.g., "What troubles bring you to this clinic?"). One would like to ask how is it that they go about deciding what the population of possible openings is. Why is it the case that something altogether different from "What brings you here?" is not to be considered as a possible alternative to it? One possible reason might be that, having made no systematic formulation of its properties, they have no way, except in an altogether lay fashion, of providing what are equivalents to it and what are variations on it. And then we get what is a perfectly naively obvious way of talking about variations: Drop one word out, stick another word in.

I want also to note that the status of "What brings you here?" as a pre-invitational/rejectional needn't be dug out of therapy conversations at all. It, and things like it, occur in a great mass of non-therapy situations. One could well have formulated a characterization of them, seeing their status as pre-invitational/rejectional, without ever looking at therapy. And that, of course, is what would provide for the patient, not having been in therapy before, seeing what it is that's being done. What I'm concerned with here is to provide that persons will be detecting what various items are doing, and handling them, via the fact that they've dealt with others.

Returning, now, to this slot in which we've found 'invitations' (and rejections) and 'pre-invitational/rejections,' another thing that goes here are pure 'pre-invitationals.' They are things like, for example, in a phone conversation:

A: Hello
B: Hello
A: What are you doing?
B: Nothing

In that slot, "What are you doing?" seems clearly to be pre-invitational. The fact that it is – and is seen to be – so, gives us some sense to a clarity of a certain term which, if you figured yourself to be a tough-minded sort, you might say was characteristically unclear; that is, "Nothing." Clearly enough he's doing something; talking on the phone, breathing, and the like. It's given the character of the first as pre-invitational that "Nothing" is clear. That is, it accepts the pre-invitational status of the question and now awaits the invitation, whatever it may be. And I'll consider items like "Nothing" in much more detail later.

The fact that there are pre-invitational items alone warrants some consideration. It may turn on things like the following: Rejections are countable things. That is to say, you're supposed to use them so as to decide whether to generate another invitation, and you ought to learn from a rejection whether another invitation ought to be made. On the other hand, someone can take it that if they've engaged in some sufficient amount of

rejections, the inviter will give up. If that's so, then there may be some attempt to use items which are not subject to starting a count, such that what you do is propose that you might make an invitation if an invitation will be well looked upon. If there is some indication to the contrary, you don't make the invitation, and thereby you get no rejection. And thereby, perhaps, you have the right to start over again without having a score.

Now, one thing I want strongly to emphasize is the way that our analysis will give us constraints on what it is that's equivalent, and what are serious alternatives to that which occurred. So, for example, one thing you would want as an alternative would be something that's a case of another class; where the classes stand in alternation. And in that regard, we could construct alternatives to "What brings you here?" which were alternatives by virtue of not being pre-invitation/rejections, but which were pre-invitations, or invitations, or other sorts of things which can also go in that slot.

Lecture 5

Proffering identifications; The Navy pilot; Slots; Paired objects; Adequate complete utterances

I'll continue our consideration of this sentence, "We were in an automobile discussion." One of the things I'll regularly do when I propose that some activity is being done in some fashion, is to provide alternative independent materials which show, I take it, that the proposed activity does get done, and in such a fashion. That is to say, if I sometimes say, for example, that one can make an identification by asserting some membership category as one that one would belong to, then it may not be obvious that such a thing is ever done at all. It may appear that I just made it up as a way of talking about this particular thing I'm trying to talk about.

So, then, for the proposal that one makes identifications by asserting some membership category as one that one would belong to, I want to note that: That membership categories have that character is something which is quite obviously not restricted to this society but is rather widespread. Here is just one of what I suppose could be an endless string of quotations to that effect. This is from a paper called 'Social and psychological aspects of education in Taleland,' *Africa*, 11, 4 (1958), suppl. p. 46, by Meyer Fortis. He writes:

> If one asks a child "who are you?" the answer is invariably "I'm so-and-so's child," or "of so-and-so's family."

The answer to "Who are you?" then, being the naming of some membership categorization device (family) or category (child), etc.

One further thing I proposed, which I want to pause to show can be done, also concerns the phenomenon of an identification. I have used, and I didn't intend it as a casual use, instead of saying that one 'makes an identification,' I've said 'one *proffers* an identification of oneself.' Those are different things, where, for proffering identifications, it's quite irrelevant whether you're correct, for example, but the issue is, again, whether it's relevant that you're correct, or whether some other identification is, or is assumed to be, more relevant than the one you propose.

There are circumstances where what's central about a proffered identification is the following: That there is some population besides yourself to be identified, and that if they accept the identification you proffer about yourself, you may have a very good idea about what identification they use for

themselves, i.e., for one, that what they will use is an identification from the same device; one that is consistent with the one you've used. And in the case at hand, that will be quite crucial.

Here is a rather striking instance of the same thing, in which can clearly be seen the proffering of an identification for oneself and for others, as well. It comes from the *New York Times*, Saturday May 29, 1965. It's an interview with a navy pilot. The headline is: 'A Navy Pilot Calls Vietnam Duty Peak of Career.'

> How did he feel about knowing that with all the care he took in aiming only at military targets, someone was probably being killed by his bombs?
> "I certainly don't like the idea that I might be killing anybody, but I don't lose any sleep over it. You have to be impersonal in this business. Over North Vietnam I condition myself to think that I'm a military man being shot at by another military man like myself."

What he's doing there, for one thing, is offering to those people who are shooting at him, that he will consider them 'military men' if they will consider him a 'military man.' And that if they both do it, then there are well-defined rules for playing that game.

I say "playing that game;" I don't mean it ironically. What I mean is that the most characteristic places in which this proffering of identification within a consistent set of categories is done, is in games. There it is quite striking that if you say "I'll be third base," unless somebody else says "and I'll be. . ." another position, and the others say they'll be the other positions, then you're not that thing. You can't play.

Now, in the case I've just quoted, my remark about the proffering of an identification is rather relevant, in that it happens to be the case – and these guys know it – that the North Vietnamese don't want to use that device which provides for 'military men versus military men.' They want to propose no 'war,' no 'military men;' these guys are criminals. They want, then, to call him a 'criminal,' and treat themselves as 'doing police action,' for example. And there are rather different consequences, of course. For one, things like the Geneva rules don't apply, etc. The situation then is altogether different depending on which is used, and whether the one he proposes for himself – and thereby the one he proposes for them – is accepted.

So, again we can see that something which we can call 'proffering an identification' is done, and is relevant, and therefore it's at least possible that such a thing could be being done in our materials. Whether it is, is another question, of course.

What I want to do now is return to another partially loose end of prior consideration, and consider what I've been talking about as '*slots,*' and from there, move to further considerations of structure. I said that one of the ways that "We were in an automobile discussion" could be recognized as an 'invitation' was by virtue of the fact that it occurred in a slot where such

things properly occur. Then I gave a list of other things which can also occur in the same slot: 'pre-invitations' and 'pre-invitation/rejections.' Now let's consider this notion of a 'slot.' Are there such things?

What's involved, for one, is a notion that there is something we could say to be a natural unit, which you could call a 'conversation.' It's not obvious how we would go about showing that there is such a thing, or how we would go about dealing with the way it's composed. One way is to propose that it has some invariable parts such that they always occur in anything you would want to call a 'conversation,' and when they don't occur, you don't have a 'conversation.' Unfortunately, I don't think there are such things. What's an alternative? An alternative would be, perhaps, that there are *invariably relevant parts* such that if they occur you have a 'conversation,' and if they don't occur, you could say they are 'absent.' That sounds very queer but I'll talk about ways in which we can come to be able to say non-trivially about something, that it didn't occur. I say 'non-trivially' because first of all, you can trivially say, when anything occurs, that an indefinite number of things didn't occur. The question of being able to say that some particular thing is absent, didn't occur, involves having to say that it is expectable that it did; that there's a place for it so that you can look to see where it was missing.

Assuming that we would have a unit, 'the conversation,' there is an object that is 'ahistorically relevant' for conversation (i.e., there is no rule of exclusion, such that it can occur in any given conversation). That is, of course, 'greetings.' One thing that's nice about greetings is that the greeting items, things like "Hello," are not greetings wherever they happen to occur. They are only greetings if they occur in the greeting place. And that's a pretty good way to see that we have a greeting place. And the greeting place is what we could call 'first position.' If the item occurs there, then it's a 'greeting.' We can also look there to see whether it's absent, because we know where to look. Since we have no rule of exclusion for it, we have a right to look to see whether it's in 'first position.' And if it's not, we have a right to say it's 'absent.'

So we do have an item which gives us some basis for saying there's something which we can call a 'conversation.' It not only has some things that belong in it, that in that sense define it, but it also has at least partially, a sequential structure, i.e., there's at least a 'first position' in it which has some item that belongs in it.

Now we want to dig into 'conversation' to see whether it has a deeper sequential structure than that; for example, how far into it there is a general sequential structure, and if not, what other sorts of sequencing rules are there. What I think we'll find eventually is that for conversation generally there's a very shallow sequential structure in the sense of general slots and items, but that there are a great many other sequencing rules which are operative.

Among the other sequencing rules are things of the following sort – what I'll talk of as *'paired objects'* such that if a first member of a pair occurs, then the second ought to be done, and if it's not, that's noticeable. The simplest case of such paired objects is, again, 'greetings.'

In the case of 'greetings' their simplicity resides, for one, in the fact that if A offers a case of the class, then B properly returns with the same case of the class or another case of the class. Now, for some of these paired objects the classes are two different ones, i.e., if A offers a question then B comes back with an answer.

The question–answer pair is not embedded in the overall structure of a conversation, which would mean, e.g., that it could only occur in third position. It can occur in many places, and can run on indefinitely, as I mentioned earlier, by virtue of this 'chaining rule' (that a person who asks the question has a right to talk again after the other talks, and has a right to ask a question). We see immediately that if, after 'greetings' whoever it is that has the chance to talk asks a question, we already have a conversation, not only as a 'natural unit' but we have it as a unit that is in principle infinite in length (under the usual definition of 'infinite' – every conversation is, of course, finite – 'infinite' meaning whatever the length, it could always be an item longer).

Let me just note that I'm making no proposal like 'one utterance, one activity' or anything like that. There are lots of things that can be combined addatively, like "Hi, how are you feeling?," or they can be combined by the same item doing two different jobs – as in the case at hand I'm proposing that 'invitation' and 'identification' are being done in the same item, "We were in an automobile discussion."

By the way, items that have these positions, if for one reason or another haven't been used in their positions, can get used elsewhere, recognizably, when they're begun with things like "by the way." For example, suppose you don't know somebody, such that if you were somehow brought to make their acquaintance you might exchange names in 'first position' with them, as that's where 'introductions' tend to go. However, if you happen to have asked them a question which doesn't involve your presenting yourself as though you're about to get into a conversation or make an acquaintance with them, then if it turns out that you do make an acquaintance with them, get into some conversation, you can at some point say, "By the way, my name is such-and-such." Or, for example, you feel you've made a breach of etiquette: An acquaintance comes up to you, they say "Hi, how are you?" and now you go into a 15-minute conversation in which only you talk and they say "yeah, yeah," and you just talk about your troubles. They finally end the conversation and start to leave, and you might say, "By the way, how are you?" as they're walking away. So the use of 'by the way' is a way of seeing that the items that it is used with have proper positions and this is not in its position, where 'by the way' identifies it as the thing it would be in its proper position.

Now, one of the things we're getting to in this consideration of structure, concerns the following. Two-party conversations are rather different things than what I'll call 'multi-party' conversations ('multi' always meaning 'more than two'). Because two-party conversations have an almost invariable structure, and that is: Two-party conversations go A-B-A-B, etc. This may sound like an immensely trivial observation. The first way to see it as

non-trivial is to see that three-party conversations don't go A-B-C-A-B-C indefinitely, and four-party conversations don't go A-B-C-D-A-B-C-D indefinitely, where you might say it would be trivial, if those others held, that A-B-A-B was asserted. Further, what makes A-B-A-B non-trivial is the fact that I'm not proposing that 'A' is any utterance of the first speaker and 'B' is any utterance of the second speaker, etc., but that we can, in fact, come up with an object which will, at least in part, be operative, which we can call an *'adequate complete utterance,'* which is not necessarily at all a sentence, and which is a proper object in A-B-A-B.

An 'adequate complete utterance' is, roughly, such a thing as can be recognized, when it's done, to be finished so that if the other person ought to speak, they can see when that's done, and speak. The notion that it can be recognized when it's completed, and thereby can be produced to be recognized as complete when done, has some kind of importance.

For one, let's say there's a kind of behavioral definition of a sentence which approaches this; for example, Whorf's. He talks of sentences being some grammatically coherent string, at the end of which there's a pause. Others also talk about the pause as characteristic of an utterance. But this cannot be supported, since a pause is an utterly equivocal object. The question is, is it your pause or my pause? Have you not yet finished and you're pausing, or am I supposed to be talking and therefore I'm pausing? And the way we get at that has to do with the question of whether there was, for example, an 'adequate complete utterance' yet. I am not, however, proposing that it's necessary to stop at the end of an 'adequate complete utterance.'

One relevance of 'adequate complete utterances' is that we could then formulate a conversation which partially went, not A-B, but A-A-B, for example; which, if we had as our formulation that the first person talks until he stops and the other person talks, we could never come up with. And there's very good reason to try to do that, since people regularly operate on things like: "I've already talked enough," "I've finished what I have to say, why aren't you talking?," "and now I'll start up again," etc.

Now the simplest kind of members of the class 'adequate complete utterance' are, again, 'greetings.' "Hello" is an adequate complete utterance. It is also sequentially relevant. At its completion, second speaker should pick an item from the same class, and speak also. And it's recognized when finished. There are other items which serve as adequate complete utterances; for example, questions are regularly that sort of item. When I've asked a question, the pause between my talk and yours is your silence.

That's a rather relevant matter. Suppose you're engaged in questioning a witness in a law court, congressional hearing, or your spouse. And what you want to show is that something you figure they're not going to tell you is something they 'know the answer to.' One way you can go about it is, you ask them a series of very routine questions. When you do that you get a 'normative pause' on their part. "What day is it?," "Saturday," etc., etc. At some point, then, you introduce your question and watch the pause. The size of the pause, and their own response to the fact that they see that they're now

'avoiding,' is sometimes perfectly obvious, e.g., they'll turn red as they see the length of the pause go, and it's perfectly clear to whoever is watching that they're not telling something, if there's something it's been proposed they know. That could only be, of course, if it were the case that one could assign whose the pause was.

Now, questions are not only adequate complete utterances, but they are *'utterance completers'* in the sense that if you're talking along for some length of time, then one of the ways you bring your own utterance to 'completion' and provide that the other ought to talk, is by appending a question. The way to get participation in a monologue is by using your monologue and simply inserting, in various places in it, question intonation, providing only for "uh huh," "yes," etc., without pausing any more than that. For example, at the beginning of this group therapy session we get:

Ken :   Hey– hey check this I went down to Hollywood Automotives?
Al :   Mm hm,
Ken :   And they told me . . . etc.

That way you get a conversation that runs A-B-A-B in which, let's say, all the Bs are 'uh huh's. And nonetheless it's a perfectly normal and legitimate conversation. It isn't the case that any conversation requires such things as 'a balancing of talk.'

Lecture 6
Omni-relevant devices; Cover identifications

By this time it ought to be quite obvious that the correctness of a statement does not of itself provide for its relevance and does not of itself provide for its occurrence. So it would not be adequate to say that "We were in an automobile discussion" was said by virtue of the fact that it is correct. Were that so we could substitute an indefinite set of sentences, and the first remark after the greetings had been exchanged could perfectly well have been, "Ice floats on water."

That may seem merely obvious. But the way it can cut is, if you read transcripts you're likely to read them through. And if somebody says things that you agree with and you figure they're so, you figure there's nothing much to say about it. And if you were doing conventional sociology all you would do with them is put them into a table. Now, it isn't that those things are any less analyzable than anything else. The fact that they are or are not in an automobile discussion in the first place, doesn't resolve for you what your task of seeing how come they said that thing and what they could be doing with it, is. Going over the thing, seeing them saying things that you agree with or things you figure are true, it isn't enough to say "he said it because it's true," or "there's nothing there to study." If he says something outlandish, that's what is seen to be studied. Of course the whole character of an education in sociology, which supposes that what's interesting to explain is 'deviance,' 'failure of integration,' 'role strains' and the like, leads you to such a view.

This time, I want to say some more things relevant to our consideration of "We were in an automobile discussion" as an invitation. I noted that while there is a correct format for two-party conversations. A-B-A-B, I don't know that there's such a format for multi-party conversations. That has a consequence for us, in that whereas for two-party conversations if we know who is speaking now we know who might speak next – and the party would know the same – for multi-party conversations that would not be so.

Consequences of that for the doing of invitations is that at the end of the exchange of greetings, who it is that ought to speak is not given via a formula generic to that type of conversation, i.e., multi-party conversation, or a specific n people in the conversation, or anything like it. Therefore, the behavior of the entrant into the conversation is quite relevant to the occurrence or not of an invitation in that slot. If he wants to see whether he's going to get an invitation or a rejection, then one thing he has to do is not fill that slot with his own talk.

312

However, whereas in two-party conversation it could usually be proposed that a speaker is addressing the other party to the conversation, in multi-party conversation a speaker may be addressing all or only some of those other persons present. That fact will have some independent relevance for us as we go along. For now, we can notice that given this fact, then one of the things that's possible in this slot is, even if the entrant remains silent and somebody who is pre-present talks, they might not talk to him. They might address one, or all, of the pre-present persons.

And of course the entrant can, perhaps feeling that he might not get an invitation if he was just to leave things that way, request one. There are a variety of ways of doing that. Or he might talk in a way which does not provide at all for him getting an invitation, and just begin a discussion about anything. He might simply assume that he has perfect rights to participate, and not give them a chance to make it an issue.

Now, questions of what might be seen to govern the determination to give or not give an invitation, are extremely complex. I don't have any very comprehensive ways of providing answers. I'll try to provide a series of considerations which I take it are required by the data.

One thing I've already suggested concerns the matter of getting the entrant to make a desired identification of the pre-present persons. Via an invitation they proffer an identification to him of themselves and offer him one also. And we might say that in exchange for his accepting the identification they proffer for themselves and for him, he gets asked in – where his acceptance of the invitation may be seen to accept the identification.

On the issue of the acceptance of a proffered identification involving also an identification of oneself, we can get at that via a rather general rule about identifications which goes something like this: If a party makes an identification of himself via some category of some categorization device, then the one to whom it is made, properly returns with an identification from the same device (which can be the same category). If somebody comes up to somebody and says, "How do you do, my name is so-and-so, I'm a doctor," the other returns, "My name is so-and-so, I'm an engineer." "I come from New York," "I come from Chicago," etc. In this case, again, they're saying "We're teenagers," i.e., they provide the relevance of the device of which 'teenagers' is a category, and he would find that he is, also.

The relevance of that would be, were it the case that there are clearly alternative identifications, and these alternatives matter. I suggested that alternative identifications can matter, with the case of the navy pilot as one instance. In that case, the device of which (military man/military man) was a category, stood in alternation to a device which contained categories such as (criminal/law enforcers). Here, the device of which 'teenagers' is a category stands in alternation to the device which contains the categories (therapist/ patients). And I'm going to say that that device is an *'omni-relevant device'*.

An 'omni-relevant device' is one that is relevant to a setting via the fact that there are some activities that are known to get done in that setting, that have no special slot in it, i.e., do not follow any given last occurrence, but when

they are appropriate, they have priority. Where, further, it is the business of, say, some single person located via the 'omni-relevant device,' to do that, and the business of others located via that device, to let it get done.

In this case, the new entrant comes in, somebody goes about greeting him and introducing him:

> *Ken* : Sure. Well let him. You know—
> *Roger* : On Hollywood Boulevard the other night they were giving tickets for dirty windshields. ((door opens))
> *Jim* : hh
> *Ther* : Hi, Jim // c'mon in.
> *Jim* : H'warya
> *Ther* : Jim, this is uh Al,

etcetera. Things may be going along, the device isn't being used; at some point something happens which makes it appropriate, and it's used. And when it's used, it's the controlling device, i.e., there is no way of excluding its operation when it is relevant. You could perhaps locate such things; for example, the relevance of (teacher/student) in a seminar where everybody is sitting around talking in a more or less homogenous group, by virtue of who it is that announces break time, or who determines that there's going to be a break or not, somebody else having suggested it. In the case at hand we have this insertion of priority items – greetings and introductions – by this guy, the therapist; and the participating in it by these others, the patients. Later on in the session we get an interchange of the following sort:

> *Ken* : I still can't figure out what the hell I spilled on my shirt.
> *Roger* : Alright I give up what's on your shirt?
> *Ken* : "Kill it!" heheh hhhhehh
> *Al* : That's not loud enough. KILL IT!
> *Roger* : You're gonna bust this tape recorder.
> *Several* : ((light laughter))
> *Ther* : Well, what's new, gentlemen?
> *Al* : That's a hint we must get outta here before he gets mad at us.
> *Roger* : We adjourn to lunch now.

That is, the closing of the session is something which this same fellow who invoked the greeting–introduction sequence, also invokes.

One way that we can see that a device (a set of categories and some ways of using it) is omni-relevant, turns on there being some insertable sequences; for example, the greeting–introduction sequences and the closing sequences, for whose orderly use an orientation to that device is essential. The device is omni-relevant by virtue of the fact that the insertable sequences, while having various kinds of priorities, don't occur at any specified point, i.e., any point located by virtue of, for example, a last occurrence. In regard to this particular

case, that device consisting of the categories (therapist/patients) is omni-relevant for this two-hour conversation; where that is warranted by reference to the fact that the greeting-and-introduction sequence and the closing sequence are controlled by reference to that device. Now, I'm *not* saying that (1) the only device that is omni-relevant here or anywhere is the one with the categories (therapist/patients) – it may well be that there are other devices in this conversation that are omni-relevant, or that (2) the only way to see that something is an omni-relevant device is by reference to these insertable sequences – there are other ways.

Now let me remark on the technique used to see and warrant that (therapist/patients) is an omni-relevant device here. Take a piece of data like this little sequence:

Ther: Well, what's new gentlemen?
Al: That's a hint we must get outta here before he gets mad at us.
Roger: We adjourn to lunch now.

We develop some analysis of it. We probably don't need as interesting a piece of data as that, but it is what occurred in this case. By 'interesting' I mean that the therapist might have 'directly' said something that anybody would recognize as the beginning of a close, i.e., the introduction of a closing sequence. In this case he happens to use something 'cryptic,' i.e., something that had to be analyzed to have that found.

It is by virtue of our seeing that this item gets placed by this fellow, and the others see what it is by virtue of seeing that he's doing it qua therapist, and is doing an intended close, and that they inform this new entrant of its import for them qua patients, that we come to pose our problem. I want to offer for consideration a difference in method from other ways of going about building machinery that analyze something or other.

It is a very conventional way to proceed in the social sciences, to propose that the machinery you use to analyze some data you have, is acceptable if it is not intendedly the analysis of real phenomena. That is, you can have machinery which is a 'valid hypothetical construct,' and it can analyze something for you. So you say, for example, 'I have a bunch of constructed phenomena that analyze some real thing. I am not saying that people do that thing via my constructs; only that the apparatus I have will predict. . .' etc. Now that's not what I am intending to do. I intend that the machinery I use to explain some phenomenon, to characterize how it gets done, is just as real as the thing I started out to explain. So, for example, if I'm going to use some piece of data with respect to the issue of omni-relevance, then that piece of data has to be analyzable itself, and that analysis would have to be correct, to work, etc., quite independently of its use for omni-relevance. That is to say, we could analyze that closing sequence, work out some of its features, before we had any idea that it involves a piece of machinery that would provide for the participants that there was a phenomenon of omni-relevance for the device that it involved.

There are some real importances to that sort of thing, apart from general issues like 'are hypothetical constructs good things, necessary things, lousy things,' etc., which make this procedure attractive to me, anyway. First of all, I take it that I want to be dealing with the real world, in all of the work. But second, what it forces is, if you're going to build a piece of machinery, then, as you build it you find things out about *its* parts as well as that it is a part of something else. So even if it didn't turn out that this was a piece of machinery for omni-relevance, it would be a something; we would have studied it, we might have it available, and we might figure that Members have it available for uses in one or another place. And recurrently it happens that some piece of data is analyzed, and when you're analyzing something else you find that the machinery built and tested to analyze one thing is now important for this other thing. That permits you to tie things together.

It also makes for certain difficulties. One of them being that the rate at which you solve problems is not at all given by the fact that you had some problem you wanted to solve. So, for example, I had the sense a year ago that 'therapist/patient' is an omni-relevant device here. I didn't know how to show that this was so, or even how to find that this was so. There were bits of data that looked like it, but until, as it happened, I was working on these things without any intention of dealing with the issue of omni-relevance, not much was happening. It was when I was working on the priority character of those insertable sequences, and asked, 'how is that priority invoked, and what allows this one or that one to do it?' that it became apparent that it was material which was very much related to the phenomenon of omni-relevance. Now that happens in many cases. It means that you often have to wait for some data to strike you, or to occur in some sequence for you to be able to solve some ongoing problem. Or you may have solutions sitting around to problems that you haven't been able to pose.

But the core point is that when you introduce a piece of machinery, that piece of machinery in the first instance introduced where it, itself, analyzes the things of which it's built, you aren't then, building some elaborate construct which, if it doesn't analyze the things you 'want' it to, you've got nothing. You may have learned an enormous amount, as you've fitted various pieces of machinery together, about what they're doing, about other data, and it turns out that they just don't analyze what you expected them to, but there's no loss there. In any event, one intends in the first instance, that each piece of any given apparatus is saying something about some particular real thing.

We have, now, the notion of an 'omni-relevant device,' with 'therapist/patients' being one in this case. We can note that this device is adequate to this environment, i.e., that each of the persons there before and after the entrant came in, can be categorized by those categories. That it is omni-relevant may not mean that they thereby must invoke it if, e.g., they're going to do an identification. For one, there may be other omni-relevant devices; for another, there may be other appropriate things to do. But the fact that it is omni-relevant may set certain constraints on what other identifications they could use. A question is, what kind of constraints might it set?

The notion I'm going to propose now, in offering *a* constraint, I'll give a term that's rather generally usable for certain kinds of identification, and I think that the way I'm using it captures its natural sense. The question we may be asking when we ask what other kind of device could they use than the one that's omni-relevant, might be asked in a context like this: Suppose there's some identification that could be applied to a set of persons, some of whom don't like that identification for various reasons, but some features of that identification are important for various reasons. What they might want, then, is something we could conventionally call a '*cover.*' Where a 'cover' is an identification which is more palatable, which can hide the problematic one, and which nonetheless allows whatever it is that the problematic one can do, to get done. And there are easily thinkable ways in which, for the kids, the identification 'patient' is not the most delightful one. They may be ashamed of it, etc. And it may be that they want to have, for purposes of the discussion at least, a cover for that.

One thing that may be necessary for a cover is that however it is that the omni-relevant device partitions persons, e.g., (therapist/patients), that that is held constant for the cover device. The notion, then, is '*partitioning constancy.*' Consider the eligibility of the device that consists of 'stage of life' (adults, teenagers, etc.). It could be eligible if those partitioned into one category in therapist–patients were together in adults–teenagers, and those partitioned into the other category also remained together. Then they might introduce themselves as a bunch of people consisting of adult and teenagers, where various things that the ('therapist'/'adult') does and that the ('patients'/ 'teenagers') do among themselves could be perfectly well handled; they would all be in the right boxes together for the purposes of the omni-relevant category (therapist/patients).

Now, if there are devices which, for a given population, have 'partitioning constancy' with an omni-relevant device, then it may well be that those are usable instead of the other, for purposes of identification. And if they are, and the other is still in operation, we would talk of them as a 'cover identification.'

One of the problems in constructing a 'cover' is that it permit you to have a set of activities look like they're perfectly ordinary. For example, suppose a mental patient is going into town with a nurse. What they want is to come off, not as a mental patient and a nurse, but as something else which is not noticeable, perfectly ordinary, acceptable, anybody could be in it, like 'male–female.' Then that would provide a set of constraints on how they might behave. It would mean, for example, that she doesn't lead him around; that's not the position of 'females.'

And it may well be that you can only pick certain devices to be able to do what you want in more or less public settings while preserving certain relevancies – whatever they happen to be – for the things that involve you in doing what you're doing – like, in the case at hand, engaging in therapy. In that regard, you might consider the problems of spies. Spies have to build 'covers' all the time. They have to build covers which provide for them seeing certain people and not others, doing various jobs, buying various things, etc.

They want to pick something that permits them to do what they have to do while not making that thing noticeable.

That the kids, or at least the one who says "We were in an automobile discussion," is building a cover, could be gotten via a consideration in general of their notion of what the entrant might expect them to be doing in a group therapy session. They're proposing it is simply a matter of conversation that perhaps any teenagers could have. Nothing special at all is going on. Whereas the entrant might imagine anything is going on; it's a bunch of kids who may well be more or less 'crazy.' He might not have any good idea what in the world these people are doing, and in fact, it looks like they figure that that's so. About ten minutes after the session has begun, the following interchange takes place:

Al :	What time is it?
Ther :	Ten thirty.
Al :	What happened to Looey. Is she not coming this week?
Ther :	She– no she won't be coming in.
Al :	Where's Jim Reed?
Ther :	Jim Reed will be late.
Roger :	Who's Jim Reed?
Al :	New guy is coming.

They then proceed to do a set of 'joking' greetings and invitations:

Roger :	Aaaghooh! ehah hah hah heh heh
Ken :	Smoke him out!
Al :	heh Hi, Hi,
Roger :	Put cher shoes on! hehhehh
Al :	Hello, Jim, take a whiff. This is <u>my</u> pipe,
Ken :	hehhhehhhehh
Roger :	'ey we got a homey atmosphere in here hehhehh Lay down. heh heh
Al :	ehhah!
Ken :	hehhehh ( )?
Al :	Yeup. Walk in, take your clothes off, and be ready.

Now, that's rather different than "We were in an automobile discussion," and they might take it that Jim would expect something like the above series.

Another consideration is, it's perfectly clear that their 'mental states' are the thing that is providing their relevant presence. Not any teenager is a member. So one thing is, perhaps, the issue of alternative devices as involving some basis for offering an invitation which would, by virtue of this identification tie, do the job of inviting him to use, and see as usable, this 'teenager/adult' device.

We could also consider the following problem. After all, this fellow was processed by the clinic in the first instance; that is to say, he or his parents said

that he ought to go there, they gave him whatever tests and decided that he ought to come in, and the management assigned him to some particular group. And now the question is, do the members of that group, i.e., the patients, have any say whatsoever as to his acceptance, or is it the case that having been selected by the management, that's it. They have no business in the first instance, even suggesting that they have to make an invitation, or they can, or they ought, or in any event that it's relevant, but if it's relevant that they better come out with one right off, and they have no further say-so over his acceptance.

The issue of an invitation, then, can be concerned with whatever challenge they're going to make to the authority of the management, either via the fact that they see that they have rights to make an invitation, or, more importantly as it will turn out, that they don't give one. And they explicitly take it that his membership has to be developed. Management can bring him in, i.e., say 'Come in,' but can't make him a member of the group, i.e., say 'Join in.'

Lecture 7

Cover topics; Collaborative sentences; Tying rules; Relational-pair identifications

I want to begin with a further remark on the matter of an identification being offered which might be a 'cover.' First of all one might notice that when an explicit invitation is offered to this fellow, it isn't "Would you like to join our group?" or ". . .this group?" or ". . .this therapy group?" but it is "Wanna join our army?" Again, it's an alternative category to the one that is relevant to – indeed, controlling of – his presence, at least from their point of view, to some considerable extent.

In line with the issue of a possible 'cover' identification, one might consider this topic that gets proposed, 'an automobile discussion.' It is, for teenage boys, a very special kind of topic; one which is perhaps as ideal a one as could be had if one wanted not simply cover identification but a *'cover topic.'* and that's because of the range of matters which are expectable and in fact discussed at a place such as this, i.e., therapy topics, which can be discussed under the guise of 'an automobile discussion:' Sex, guilt, independence, autonomy, authority, parental relations, the state of society, death, you name it. All can perfectly well be handled as sub-topics of 'an automobile discussion.' And even in our very short segment, more than a few of them are.

The automobile discussion, then, can provide perfectly ordinary, i.e., things-that-teenagers-do, bases for dealing with those matters rather than, for example, their being introduced by virtue of the fact that they are the proper things to be talking about in a therapy session, or they are the things that independently disturb these kids. And it might not be simply incidental that, if the format of 'an automobile discussion' is used, then there's a very nice shift that takes place in the relationship of the two sets of persons present (the adult therapist and the teenage-boy patients), and that is, that on this topic they're the experts and not he. (Though we might say that on each of the sub-topics he ought to be the expert.) And one might explore that also, as further related to this issue of offering the cover, in terms of which anything that gets said could be understood as properly raisable, without noticing that such matters would perhaps have to be dealt with anyway for – as they put it – "the cure" to go on.

When I started considering the line, "We were in an automobile discussion," I said that it is possibly to be seen as an invitation, were it to occur

alone. As it happens, it does not occur alone, and I want now to consider the actual features of its occurrence.

Ken :		We were in an automobile discussion
Roger :		discussing the psychological motives for
(	) :	hhhhhhh
Al :		drag racing on the street.

Really a most remarkable phenomenon. Three people collaborate in the production of a single sentence. Now, *collaborative productions* of a single sentence are to some extent not terribly rare. But those that are not rare are relevant in the way they indicate how special the phenomenon is, otherwise. For example, you're sitting at the table, somebody makes a request: "Pass the salad." Somebody else, say, perhaps, the person who got the request, appends to it some word or phrase that they propose properly completes it: "–please." Another way 'collaborative' utterances get done is, say, one person produces an almost complete sentence and finds himself searching for a last word or a last phrase which he can't find. Another offers it. So, in one of the therapy sessions we get:

Ken :	He looked like he was coming in here for uh. . .
Al :	–kicks.
Louise :	–guidance. heh

Note here that the inserted word is treated as a 'candidate,' and the other person then accepts or rejects the candidate term, and goes on to complete the utterance. (In the case at hand, Ken rejects the terms offered, and continues to search for the phrase, for approximately another full minute, and there are further offerings of candidate phrases and terms.)

And there is, in the segment we have, an example of another, very characteristic two-party production of a sentence. It turns on the idiomatic phrase, 'circumstances beyond one's control:'

Roger :	Kids don't drive long. . .by the time they're eighteen they're back walk(hh)ing hehh through circumsta(hh)nces hehhehh
Ther :	beyond their control.
Roger :	ehhehh Yes hehhehh

But for sentences of the complexity and un-idiomaticness of form of "We were in an automobile discussion. . .etc.," I take it that it's really a striking phenomenon.

Now, one obvious thing that such a production might be seen to do – and it's perhaps as neat a conceivable means as you could have for doing it – is showing the new guy that this is a group. They do together what is among the most prototypical things that a single person would do. And they do it in close coordination; there are no pauses that are much noticeable in that sentence.

I tried to find some literary uses, but it's so powerful it's banal. It would just be corny. I heard a musical version of Edgar Lee Master's *Spoon River Anthology*, where the device was used, and it was used to do just exactly the same task. He was trying to show a pair of happy lovers, and the happy lovers talked this way, e.g., she would begin a sentence and randomly stop in the middle, and he would continue it. And that way they provided a demonstration of Freud's remark that only in love do we feel we are one. And I'm told that in the comic strip Donald Duck, the author puts together three of the character's sentences in that fashion.

We get, then, a kind of extraordinary tie between syntactic possibilities and phenomena like social organization, i.e., that way of not stating, but presenting the fact of organization. There probably isn't any better way of presenting the fact that 'we are a group' than by building a new sentence together; one that's coherent, grammatical, etc., and unplanned. Its production involves, very markedly, a very very close and quick attention to the talk of each other. And in considering this usage we're going to begin to develop some extremely central matters. From it, we get the kernel of what makes something that could be called 'a conversation,' in the sense of how it is put together. And one thing that involves is a long list of things I'm going to call *'tying rules.'* They are a means by which one piece of conversation is tied to another.

If conversation simply consisted of A-B-A-B in alternation, then one might, for example, be perfectly well able to disorder all the parts, as long as the alternation is preserved, and still have a recognizable conversation, or even the same conversation. What these 'tying rules' do is radically restrict that possibility, and provide for very local control over the relationship between utterances.

Now, what happens with "We were in an automobile discussion" is an example of a 'tying rule,' and with that example we will have hundreds of examples constructable:

> *Ken*:   We were in an automobile discussion
> *Roger*:   discussing. . .

One of the things we see that's interesting is that "We were in an automobile discussion" is a perfectly good sentence by itself. When we get "discussing the psychological motives for," what we have is something produced which, by itself is not a sentence. Its user makes his piece of talk a dependent clause and makes the prior piece of talk an independent clause and not a sentence. So he hooks his statement onto the previous one.

This happens to be but one case of one large class of these tying rules; and these are what I'm going to call *'second speaker's rules.'* What I mean by 'second speaker's rules' is that a speaker makes himself a 'second speaker' by something he does, and makes, then, the one who spoke before, a 'first speaker.' He does that by the way he ties his remark to the one that's gone before. So, for the analyst, cases of the second speaker rule are not found via

the fact that one sees some utterance in the first instance as a 'first utterance,' made by a 'first speaker.' You start with something recognizable as 'the second member of a pair,' and then turn backwards to something that is not recognizable as a first member of a pair, unless one has the second to see that there ought to be one. And those are in contrast to first speaker tying rules, e.g., I ask a question. I make myself a first speaker and the other, a second, where the first item is recognizable as 'a first item in some pair.'

What we can see is that the rules for building dependent clauses are 'second speaker' rules. In the case of "We were in an automobile discussion," "discussing. . .", we could say we have a rule which says 'if you want to make yourself a second speaker by building your statement as a dependent clause to a prior sentence, one that could be constructed as an "independent clause," then, if that one ends in a noun, participialize the noun and talk in some syntactically consistent way.' For example, "We were having dinner." "dining on roast beef." Of course you can use whatever else the grammar provides as ways of building dependent clauses.

Now, if we consider this second utterance which ties itself to the first, i.e., "discussing the psychological motives for," one of the things we might want to know about it is, what would be relevant to tying the utterance to the first and not simply beginning a second sentence, e.g., "We were in an automobile discussion" followed by a second sentence, "We were discussing the psychological motives for drag racing on the street." What I have to say is not intended as exclusively or exhaustively an answer to that, and perhaps it isn't even plausible – much less convincing – even as a partial consideration. But there are some good grounds for suggesting that such things as I'm going to propose are sometimes relevant somewhere. They concern the following sorts of things.

I've mentioned this matter of *paired utterances*, like question-answer. They are of course enormously relevant in two-party conversations. They gain a larger relevance in what I've been talking about as 'multi-party' conversations. They gain that larger relevance because in multi-party conversation there isn't a formulaic way of locating who should talk next, i.e., there is no simple expansion of A-B-A-B to, e.g., A-B-C-D-A-B-C-D. What one gets, then, is a heavier reliance on these paired utterances which assign the second person's rights and obligations to talk; for example, if they're addressed a question, then they have an obligation or a right to talk next.

That seems to provide a differentiation in the phenomenon of *interruptions* in two- and multi-party conversations. In two-party conversation, if A is talking along and B starts to talk in the course of it somewhere, then we might say that B is interrupting A. In multi-party conversation, at least where we're dealing with some utterance pair, that doesn't seem to be the case. What seems to be the case is something like the following. Suppose A addresses a question to B, and now C starts talking at the end of that sentence. Then, if B (the proper answerer) starts talking also, regularly it turns out that while it would read off the tape like the proper answerer is interrupting C, it isn't treated that way. C seems to treat himself as having interrupted B (the one

who hadn't yet spoken) and stops. That is: A to B; C starts; B starts; C stops. We get, then, a notion of 'interruption' which is partially independent of who happens to be talking. That is, again, C is talking and B starts to talk. We might figure that B is interrupting. But C is interrupting from the moment he begins.

That means in part, say, that if "We were in an automobile discussion" were an 'adequate complete utterance,' and it were an invitation to this fellow Jim, then it's the business of these other guys, accepting the fact that the invitation has been made, to find a way to do what they need to do before Jim properly speaks – perhaps to accept the invitation. What they do is provide that an adequate complete utterance has not occurred, so that the *slot* for Jim to speak doesn't open here. They then proceed to modify the invitation, which can then be heard as: "Hold on for a while, see what we're talking about, and how we do it." That is, for Jim, "automobile discussion" might be a very nice thing to hear. "Oh, they talk about whatever it is kids talk about anywhere, and they're not going to be talking about things that are really godawful things to talk about." The modification provides that when the slot does open up, he has been told that in fact they talk about things that he might not be able to participate in right off.

Now that sounds like an extravagant orientation to these slots being opened or not, and were I just to have that, I wouldn't believe it, either. Indeed, I wouldn't have come up with it had I not had other, and very strong, indications that there is such an orientation to slots. Here are some of them.

First there has to be a differentiation between those kinds of items that have strong but short control over sequencing, and those that may have strong or weak, but long control. A thing like question–answer is a case of long control. That is, if you ask a question, then it may be open to be answered any time over whatever future as long as it hasn't yet been answered. And it isn't required that it be answered right off, so that you can get other things fitted in between the question and an answer. A simple one is:

A: Did you put out the garbage?
B: Did I put out the garbage?
A: Yes.
B: Yes.

Some things don't have that character; for example, greetings. If I say "Hello," then if you don't answer with "Hello" or something that's a member of the class of 'greetings,' but introduce something else, then you wouldn't at some indefinite point into the conversation offer "Hello" as the return.

Here is one thing that has a short control, but seemingly a rather powerful one. I was studying phone conversations between members of a psychiatric clinic and callers who tended to be suicidal. The conversations began in a very regular way, on the part of the psychiatric clinic. They would say things like, "This is Mr Smith, may I help you?" and things like that. There's a proper return to that, which was regularly offered, and by non-suicidal persons it was

almost universally offered, which is, to "This is Mr Smith may I help you?," "Yes. This is Mr so-and-so."

Now there are a lot of people who don't like to give their names. Especially people who are in one way or another troubled about what they're getting into, etc. You could simply propose that all they have to do is just not give their names; to "This is Mr Smith may I help you?," just say "Yes" for example. But they didn't do that. What they did was to use some more or less elaborate means which served to never have the place where their name belongs occur, such that they never gave their names but their names were never absent, i.e., that slot never occurred.

They used several means which are very generally usable to do a similar task. One of them was, for example:

A: This is Mr Smith, may I help you?
B: I can't hear you.
A: I said my name is Smith.
B: Oh Smith.
A: May I help you?

That is, if you ask a question that indicates that you can't hear what was said, upon the return to that question, which clarifies or repeats what was said, you have the right to repeat that thing to indicate that now you've heard it. And in doing so you fill the place where your name might otherwise occur. That is, this thing having been broken apart, if the other then comes back with the second part of it, "May I help you?" you can answer that, "Yes," and your name is not 'absent.'

Sometimes that got extremely elaborate, so that it would go on for a relatively long time. And while there might be some attempt by the staff to avoid allowing the slot to be closed, the callers normally won out and their name did not occur and was not absent. That they were doing this, seemed quite clear. In any event, it got a kind of verification by virtue of the fact that for people located in this way (and they could be located immediately, right off) if you asked them their name later on, they wouldn't give it.

It's the fact that they go through all this trouble – if you want to call it that – i.e., they don't simply ignore that sequential structure – that suggests to me that some such consideration might be involved here, where "We were in an automobile discussion," with its character as an invitation, is not allowed to close and the slot for the invited person to speak is not allowed to open until after that perhaps drastic modification has been provided.

I want now to take up a matter related to our considerations of an identification, raised by a question somebody asked me. The question was, Am I supposing that determinations of activities are prior to determinations of identification? And it may seem that that's what I've been saying or implying or assuming.

Now first of all, I'm not assuming it. I think it's so for very many cases. If you want to play baseball then the activity provides the relevance of the

collection consisting of (first baseman, second baseman, etc.). And there are a great many activities that provide for the relevance of some device or some collection. It's very important that that be so. And I want to deal with the fact that it's so.

If what we're dealing with is identification via membership categorization device categories, then there is a large problem for persons identifying each other or somebody else, which is: There are always alternatives. If you're going to use categories of a single device, which one do you use? The question is, is there some more or less general solution to that kind of problem? That solution has to be one which is usable by persons who don't know each other, if, for example, they're going to identify themselves to each other, say, at the beginning of a first conversation. They want to convergently select the same device as relevant, so that one doesn't start off by naming his religion when the other is interested in his occupation. And if one can pull out certain ways of getting devices via activities, that helps matters out. If you know the activity, you have the way of categorizing a person. If you're going to have a party, use 'males and females,' etc., etc.

We can try to consider what sorts of general ways we might construct for arriving at devices for categorizing. Suppose we have an nth person to identify, and that nth person is not a first. Then there's a routine solution: If the others have all been categorized by some given device, use the consistency rule to get you a category from the same device. But if you're dealing with a single person, then there doesn't seem to be any unique solution, where a unique solution might be the basis for a convergent solution. That is, if there's a unique device which is appropriate in one way or another, then that might be the way that persons get together independently on identifications. Obviously for some activities there's a unique solution; a device bound to that activity.

Now, here's a piece of data:

A: ((a little girl)) Who's that?
B: ((her mother)) That's Rita. Remember when you went to the party last week and met Una? Well that's Una's mother.

That's not only a very characteristic way that persons are identified by others, but it's a very characteristic way that people go about identifying themselves to each other: "Do you know X?" "Yes." "Well I'm his neighbor."

In considering this piece of data and its character, one can perhaps come up with a rather elegant solution to the problem of doing identifying, where there's no other activity being done than identifying. So you can't find an activity which solves the problem of how to choose a device for you. You're simply doing identifying, and if you've got one person, you've got a problem. A great many devices are available. Now consider the following possibility. We know there's a solution for an nth person. Is it the case that we can get a solution for two persons? Yes. There's a device that can be used to categorize a population of any size and it consists of a set of 'relational pairs;' things like

(father–son, brother–brother, sister–sister, friend–friend, neighbor–neighbor, stranger–stranger. . .etc.). Any two persons can be categorized by it. If that's so, then you have a way of solving the single-person problem, which is: Take the person you have to categorize; treat them as the second person of a pair for which the first is known; find a first. If you can find a first – and in principle you can find a first – you've got a solution. If you can't, then you're no worse off than you were to start with, i.e., you're back with the one-person problem which is not capable of giving a solution in any event.

Note that the device that consists of 'relational pairs' is uniquely applicable to two persons. That is, for any two persons there is a device consisting of 'relational pairs' which will provide for them to be categorized as a pair – and only one such device that could hold for any two persons, i.e., it's a unique device. And the two-person problem being solvable uniquely, may well be at least part of the basis for the tremendous regularity with which it gets used. Where, routinely it's the case – and it's the case in this piece of data – that it isn't a matter of some first person being chosen with whom you have some special intimacy. It's not that you choose only those persons as first of a pair, who really matter. In this case, the kid barely knows Una, and nonetheless the mother apparently takes it – and we regularly take it – that when we've got such a pair, the identification is complete.

Again, we can come to see 'uniqueness' as relevant in that, in the first instance, if an activity does have a unique device tied to it, then the device is regularly used. And also, recognizing that a name is not treated as an adequate identifier, but when *any* category, perhaps, is offered, the identification *is* treated as adequate. If the world works that way, that's extraordinarily lovely.

Lecture 08
Orientation; Being 'phoney;' Hinting

I want now to make a few observations about the possible *orientative*, as well as the possible identificatory characteristics of this line, "We were in an automobile discussion."

On the matter of orientations: In the first instance, it's perfectly plain that one way you can orient people to, say, what was going on, or what it is you do, etc., is by the name of some activity. Now what becomes interesting about an orientation, for one, is the question of its *sufficiency*. If somebody is doing what seems to be an orientation, then they can regularly enough use either a name that does orient the other person, or one that doesn't, both of them being perfectly correct. Suppose you turn to somebody sitting next to you at a dinner party and say, "What do you do?" and they say, "I do assaying with an ultra-centrifuge." And you say, "What's that?" Then they might say, "I'm a lab technician." If, however, it was a group of lab technicians, then it would be quite sufficient to have said, what, specifically, you do, and more relevant than 'lab technician.'

One feature of orientations, then, is the way their sufficiency turns on an initial identification made of the recipient by the one who is doing the orientation – where that identification can be categorial. On the basis of that identification, one would build what one takes to be a 'sufficient orientation.'

The core character of that initial identification of the recipient can easily enough be seen in considering how you make, e.g., 'put down' orientations. Suppose four of you are sitting around the table and a fifth comes in and you say, "We're playing bridge. That's a card game for four people. . ." and you go on and give a detailed description, where you know damn well that "We're playing bridge" is perfectly sufficient. Alternatively, you can construct orientations which you know the other will not understand, and you can do that for a variety of reasons. Say you want to check out whether they'll go along with anything.

The question "What's that?," say, after "I do assaying with an ultra-centrifuge," is a remark that 'the identification you used on me to give the sufficiency for the orientation you made, was wrong.' And it can be wrong in a variety of ways. For example, it could be wrong by virtue of the fact that you properly used some hint that I seem to give off, e.g., that I'm sitting next

---

This lecture consists of Fall 1966, lecture 8, with a segment of Fall 1966, lecture 3. Again, it deals with matters not discussed in the spring 1966 lectures, and it has been placed where it 'belongs.' But in fact, these matters make their first appearance in the Fall 1966 lectures.

to you at a dinner of lab technicians, but it turns out I'm only a friend of some lab technician and not one myself.

Again, then: One rather important aspect of doing an orientation is the issue of sufficiency. And then there is the fact that designing the orientative remark with its sufficiency in mind, involves having made some identification of the intended recipient.

Now, for the line "We were in an automobile discussion," it is perfectly possible for such orientative remarks, placed as this one is, to have no identificatory import in regards to those who *make* them. That is, it need not be an identification made via an orientation. They might be things that, for one, 'merely happen to be correct,' i.e., in fact, before this guy came in they were engaged in an automobile discussion. And if the phrase 'an automobile discussion' is sufficient, their saying it simply clues him in to what it was they were doing. And especially when one considers orientatives other than remarks such as this one, there isn't any necessity that they be combined with an identification.

But the issue I'm going to address is, what other matters are involved when the orientatives *are* possibly involved with an identification. Where, putting it roughly, let's say, for example, that one names as what one was doing, something that may serve as an orientation of itself, but the something that one was doing provides a 'hint,' say, as to the sort one is. And this may have some important feedback on what kinds of things you can use to make an orientation where you *don't* want to make an identification.

Now an added issue comes up when an orientation is being used to do an identification. That issue is relevant in seeing what you could use to make, say, an orientative identification, or whether you can use something to make an orientation alone, without it implying that you are also making an identification. The issue is that which we can call 'misleadingness.' And closely related to it is the notion of being 'a phoney.'

One of the first things involved in the phenomenon of doing 'being a phoney' is that you can perfectly well be accused of being phoney without having made any explicit claims to being a member of a category that you're seen to be *not* a member of, though having, indeed, intended to suggest that you were. That one can be seen to be a phoney without having made an explicit identificatory claim, is, of course, independent of, and a complementary consideration on, the ways that one can hint at an identity, or be seen to be hinting at an identity. What one needs to examine, then, are a set of things one hints with, or can be seen to be hinting with.

So, for example, the magazines on somebody's coffee table are routinely seen to be intended to suggest that they are intellectuals, or whatever else. And you can walk out of a house and say that somebody's a phoney by virtue of some lack of fit between what you figured you could infer from various things in their house, and what you've found out about them other than that. It's not merely that you say that there is various inconsistent information being given, or that "At first I thought such-and-such but then it turned out no," but one can assign 'being phoney' to their use of things recognizable as

'hints.' Which is to say, for example, that if they put some magazine on their coffee table, if they have some painting on the wall, if they use some lingo in their conversation, then they're responsible for it being seen as 'identificatory' and, if in some way it's now found to be incorrect, then the assertion 'phoney' is properly makeable.

Now there are some rather important methodological issues involved in the existence of and usability of a notion like 'phoney.' Let me just allude to them. What's involved are problems dealing with such matters as: Consistency between a set of facts that you find; attribution of error; when it is that some problem that gets posed can be considered to be resolved, and a few other things. And what's methodologically involved is this sort of thing: Consider the case of the magazine on the coffee table. A person who comes into the house can look at it, treat it as an intended identification, and that identification is now a claim. If, in due course, there are activities which seem relevant to that claim that turn out to be inconsistent with the initial determination, then there are a variety of things that, at least in principle, could occur. With regard to the notion of 'phoney,' what's involved is that one would not take it that one's first impression was wrong and got corrected, though of course that's a quite legitimate procedure in other circumstances: "At first I thought he was very cold, but then after getting to know him, I found out that he's really a very warm fellow," for example. Rather, one's first impression here – and, very important to the whole thing, without any claim having been explicitly made – is taken as something that they invite or require you to make, by what they've done.

And involved in that, then, is that you are quite legitimately permitted to figure that persons know that some object is a 'hintable with' object. The issue of *not* knowing that something is to be hinted with, although ancillary to our consideration here, has an independently prominent, interesting place, some-what largely in psychiatry. There, a claimed naiveté about hints, which the psychiatrist, in company with 'the rest of society' can hardly believe, or may believe but figure it's amazing, constitute a strong set of symptoms for things like 'latency complaints.'

Latent homosexuality involves doing those things which anybody, homosexual or not, knows to be inviting homosexual contacts, let's say. Where, when it happens, you're surprised. And there are lots of things like that. Girls who get regularly raped. Now I'm not offering an analysis of the psychiatric situation, I'm only providing the structural place that the phenomenon has, i.e., the character of certain things as warranting being seen as 'hinting.' And I'm not saying whether they 'really know,' they 'don't really know,' etc., or why they pick up these 'hintable withs.'

When the thing on the table is seen as a thing with which Members hint and thereby make a claim to membership, the issue is no longer 'is he one of them or not,' i.e., 'this is the first piece of evidence, let's consider the rest,' but this is something that he can be held to, such that if it turns out that he isn't one of them, you're not 'wrong,' the matter isn't 'corrected;' rather, it now gives you a different identification whose charactaristics are that it's based on

the original one having been 'misleading,' i.e., 'a phoney.'

One of the beautiful things about the notion of 'phoney' is that you can be the same category, i.e., a phoney, for a whole range of different possible intended identifications. You could be a phoney hotrodder, a phoney intellectual, a phoney beatnick, etc., where that conclusion is in the first instance a systematic way of processing data, i.e., in which the 'error' is now assigned to the one who gave what is to be treated as a 'hint.' And furthermore, it is taken that they gave the hint intending to have you think that they were a member. And all this, of course, without explicitly determining that they know it's a hint, etc.

What we're seeing, among other things, is that the time at which some piece of information is garnered is criterial to the kind of use it has. That is to say, at that point when an identification might be present, if something is warrantably seen as such, then a claimed identification is findable. It can then be dealt with, with respect to whether it stands up. And if it doesn't, it isn't merely that 'I was wrong about what I thought he was, and now I don't know what he is,' for example, but 'Now I know what he is; a phoney.'

Now what that has as its import for things like "We were in an automobile discussion" is, unless you're prepared to sustain what would be seen as a claim of some identification, then even though it's perfectly true that, for example, you were in an automobile discussion, or you did read that issue of the *Saturday Review*, or *Fortune*, or whatever it may be, then you'd better well put it away, or not refer to it.

And again, the fact of 'correctness' gains a kind of irrelevance. If they 'merely happened' to be engaged in an automobile discussion, but, e.g., that isn't the thing they regularly do, or whatever it is that would be inferred from hearing that they were engaged in an automobile discussion as something that would suggest an identification, were not correct, then they'd better well not say that they were engaged in an automobile discussion. As a possible identification, then, an automobile discussion is 'just one thing that such people do.' Then, unless, e.g., the other things that such people as are identified by it do, are done by you, you will have been seen as being misleading, and thereby, perhaps, also a phoney.

There are other things like: It's not merely the case that you were in an automobile discussion, but that you characteristically do it. And that issue of 'characteristic' with regard to some 'hintable' is itself independently treatable. Suppose you're sitting at home one night, you flick on the TV set, and now you're watching some serial. There is a knock at the door, and the first thing you may do is turn off the TV. You may do that by virtue of the fact that somebody who comes in is going to figure that that's the sort of thing you do, and not that you happened to have turned it on just now, though you may well say, "I just turned it on;" it being a thing which can be characteristic of some people. It's often extremely hard to establish some argument that the thing you were doing is something you did only once. And precisely those things for which it's extremely hard to do it, are those sorts of things which have this identificatory import. That there are a class of such things – and of

course they're not just statements, they're a much larger set of things – which are properly seen as 'claiming identification' not only makes them available for such use, but constrains the various kinds of information, remarks, things you can do otherwise.

I bring up these issues of 'sufficiency' and 'hintables' in order to get focus on what else the various persons who could be seen as being 'talked on behalf of' (i.e., Roger and A1), might see implicated in that statement "We were in an automobile discussion" which they might not want to have happen. And also to get us in a position to deal with what it is they do with that statement. They modify it, that's for sure, and some issues are, then, what the character of this modification is, and what is involved in the fact that they do modify it – what 'are' they, for one? – and how the modification of the statement might operate on the possible identification it might have affected. They don't, in this case, have the chance to pick up the magazine when they notice who's coming in the door, and stick it under the table. The talk is out, and it has to be dealt with.

Lecture 8
'We'; Category-bound activities

I want this time to focus on the word 'we' in 'We were in an automobile discussion." In *The First Five Minutes*, you will recall the authors' analysis of the utterance "What brings you here?:"

> Three of the four words in the sentence; 'what,' 'you,' 'here,' are what the grammarian calls 'substitutes' or 'shifters' or 'pronominal forms,' words the denotation of which in a specific context depends almost wholly on that context.

It's perfectly true that grammarians call them things like 'shifters,' etc. However, it would be rather difficult to support the notion that grammarians say that the denotation shifts in every or many uses, since that's not a question which grammarians address. But it is true that those terms have been subjected to very considerable discussion by philosophers, and I'll mention some of the literature on them.

Nelson Goodman, in *The Structure of Appearance*, calls them 'indicator terms.' Hans Reichenbach, in *Elements of Symbolic Logic*, chapter 7, calls them 'token reflexors.' Russell has a discussion in *An Inquiry into Meaning and Truth*, chapter 7. He calls them 'egocentric particulars.' Quine, in his book *Word and Object*, section 21, calls them 'indicators,' also. Bar Hillel, in *Mind*, 63, pages 359-379, calls them 'indexical expressions.' Cullenson, in *Language Monographs*, 17, calls them 'indicators.' They're rather fundamental for logicians because – to use Bar Hillel's observation – although it may well be the case that over 95 percent of all natural sentences contain them, they're very very troublesome, if not impossible, to handle, if what you want to do is build characterizations of the truth or falsity of particular sentences.

The core thing about these terms that have been examined, and why it's of interest to the logician, is that they have an extraordinary transiency of reference. So the issue is, if you're dealing with the truth or falsity of propositions, then how are you to interpret a proposition which has the term 'now' or 'you' or 'it' or 'we' in it? That is the logician's problem. What we have to do is to try to construct what a procedure might be for determining what it is that's being referred to when somebody says 'you,' 'we,' etc. These terms are extremely complicated, and in concerning myself with 'we,' while one point I have to make can be said in a sentence, its consequences wouldn't be seen if I said that sentence, so I'm going to go about making the points I

Includes pp. 1–8 of Spring 1966, lecture 9.

want to make in what may seem a rather elaborate fashion. The roughest message you might pick out of what I shall say is that in dealing analytically with conversation, you must at least be cautious in the use of what you've been taught about grammar.

It is perfectly legitimate, in English, for a single speaker to produce instances of the following two sorts of sentences: (1) 'We do X,' and (2) 'I don't do X.' For example, "We are fickle," "I am not fickle." "We cheat," "I don't cheat."

It might seem that if a single speaker can make both those statements we can easily derive a contradiction and thereby establish another way ('another' in that many have been established) in which English can be seen to be 'inconsistent.' They may look, right off, to be contradictory, but it would pay, even if it looks very routine, to work out how they are, or how they might be found to be so. For that will then permit us to examine what it is that we do to find it 'contradictory,' and then to see whether what we do is, itself, independently legitimate.

We would start off by asking, about "We were in an automobile discussion," is it the case that 'we' is a set containing these guys' names, directly? It is perfectly proper to say 'we' referring to some set consisting of a list of members. In the data, Roger at one point says to Al, "We're doing better than he is. Proceed, I'm with you." Where "I" [Roger] and "you" [Al] add up to "we" [Roger, Al]. This use of 'we' is what we could call a 'set name,' and as such, we could have a set with members of the following sort: One member at least would be 'I', and there would be others perhaps on some occasion, 'A' and 'B,' where 'A' and 'B' are now names of names; i.e., you could replace the letters with particular names.

We could proceed in two different ways. One of them is: There are conditions under which if something is true for the set name – or false, for that matter – then the set name can be replaced by the set members. So we would get, then: "We do X;" if that is so, it's so for each of the members, then we get: ["I do X," "A does X," "B does X"]. Now, each of them have to be correct for the other to be correct, so we do have a contradiction between (1) "We do X" and (2) "I don't do X," since the 'I' is contained in the set 'We do X." That means that either (1) is false, or (2) is false, or something's wrong, i.e., if it's the case that the language permits both, then in harboring a contradiction like that, it's inconsistent.

There is, however, a use of 'we' which is quite different, that works in the following way. If you've used any membership categorization device category, i.e., any category like male–female, Negro–white, old–young, first baseman-. . .second baseman. . .catcher, fullback. . .halfback. . .etc., doctor. . .law-yer. . .etc., native–foreigner, any of these, you can on some next occasion wherein you want to refer to the same object, use a pronoun to do it. If you've referred to a category in its plural form, e.g., Negroes, women, then you choose from a plural pronoun, most particularly 'we' or 'they,' and you may pick 'we' or 'they' by reference to whether you are, or propose to be, a member of that category. So you can say, "kids race cars," "we race cars,"

"kids race cars, we don't get caught, however."

Now the question is, what are the conditions for the correctness of a statement that would be asserted with a categorial term as the term which is the subject of the sentence, where any of those can be reasserted with pronouns in that slot? For example, "women are fickle," "we are fickle," "they are fickle."

For one, it is the case about such categories (and formulations of knowledge and facts about them) that the categories or the legitimate plural replacements may be perfectly properly used without the user having any ability whatsoever to replace it with a list of those persons about whom it is true. That is, 'we,' 'they' can refer to a category which has as one of its crucial properties that no intention exists of listing the incumbents, and furthermore they're not listable, i.e., an infinite population. Consider perfectly ordinary uses of 'we' of the following sort. The first quote is from the *New York Times*, an article on Yugoslavia:

> Yet Communist officials appear to be optimistic. "We haven't had good roads since Roman times, so why should we worry if the highway to Belgrade is not finished tomorrow", one said.

The next one is from an article on Israel:

> "Don't forget this is our country," Ben Josef said with a smile, "We have been here much longer than since the thirties. Up there," he gestured toward the hills, "stood one of Solomon's cities."

That is, 'we' can be used to refer to all members of the category that have ever lived and may ever live.

Furthermore, once you've gotten the plural pronoun replacing the categorial term, there is no movement, necessarily, to any set-of-members reference, i.e., reference via a list of particular names. The categorial reference, once established, holds. It can be said: "Americans do X," "We do X," "I do X." It can also perfectly well be said, "Americans do X," "We do X," "I don't do X." No contradiction at all.

If, however, 'we' is being used to refer to a set of persons who are seen as a list, then, if one has 'we do X" or "we did X," and either 'I' or 'you' who are on the list haven't, then one of the two is indeed wrong. And somebody has a good complaint, and can raise it, and they do: "You just said 'we do X,' but you didn't do it, so how can you say that?"

Given the ambiguity of these terms, i.e., how it is that the use of 'we' is derived, there is the basis for making jokes. For example, somebody reports some 'we' statement which, if it were heard as an assertion of a member of a list and not a member of a category, would be nonsense: A little boy announces, "We're playing the Rams today!" You say, "Are you going in as fullback or tackle?"

In any event, for any use of 'we,' one has to have some way of making a

determination as to, is it being used as a replacement for some category, or is it being used as the name of a set consisting of a list of persons? Quite different treatments will occur, depending on which is heard, and the treatments would be quite anomalous unless one comes to have some way of seeing which use it is. And of course there can be overlapping use, where the category may well be one which has a list, and one's name appears on that list. A member of a football team can then say in both senses, "We're playing the Rams today."

I want to turn now to one thing that is special about those categories. Such knowledge as is recognized as correct by virtue of the combination: [a category (whatever it is) plus some thing they do or attribute they have (category bound in that sense)], has a rather important property which I talk of as *'knowledge protected against induction.'* By that I mean, if you have a statement, "Women are fickle," then it is no way to undercut that statement to introduce as a possible contradiction some statement which consists of a name of a person, plus not-fickle, where that person is a member of the category. That is, there's no contradiction between "Women are fickle" and "Mary is not fickle," where, for the latter you can get, if Mary is talking, "I'm not fickle," or if somebody is talking to her, "You're not fickle."

There are some very important consequences of that knowledge, which is in the first instance formulated by one of the membership categorization device categories as correct, being protected against induction. And that it's not merely an assertion of mine that it has that character can be easily enough seen by considering how one understands things like the following. Suppose some positive piece of information is bound to a category you're a member of, e.g., "Jews are rich." If a member of that category is not, then he tends, not to see himself as a living demonstration of the error of that statement, but to take it that there's something the matter with him. And one of the important things about 'knowledge protected against induction' is that members who find for some of it that it doesn't hold for them, have a program laid out, which is to make it true for them. Furthermore, for some such things they may come to feel, again, not that the knowledge is wrong, but that they're 'phonies;' they're not real members. That is, one way persons come to see that they're 'phonies' is by virtue of some piece of knowledge, holding about a category they belong to, does not hold about themself.

As another way to see that there is a corpus of knowledge which is protected against induction in the way I talk about, consider the following. The first one, the first five, the first ten members of some category that you meet, you can perfectly well see as 'exceptions.' You don't say, "See? What we know about Negroes is wrong," but, "I've met many exceptional Negroes," for example. And that holds for each of them. The fact that you see a person as 'an exception' involves, then, a way that you use this knowledge protected against induction.

Note that knowledge protected against induction is not simply important as 'maintaining negative stereotypes,' if you want to think of it that way, but consider, for example, if something is known to be so about an occupational category, or, for that matter, a religious category, then the list of things which

are known to be so about them provide an advertisement for persons who, if they want those things said about them, or want to feel those things as so about themselves, have to arrange their lives so as to become members of this or that category.

Let me try in perhaps a little different way to bring home a few points concerning the character of statements like "Women are fickle," "Jews are rich," etc. which it appears to me many people don't properly appreciate, i.e., understand. I'm sure that many people, especially the more liberated, think that those are stereotyped statements which aren't really true; they are used, and those who use them are unfortunate objects of contempt or subjects for better education.

Holding the notion that they're not true involves hearing them in the first place as candidates for being true under some formulation such as: What they're saying is, 'women' means 'all women;' that's subject to a test; for example, go out and use the device 'male–female;' locate all cases of the second class and determine whether or not they are indeed fickle. If not, then the statement, purporting to be true, is not true, or not true in part. Now unfortunately, the aim of using such a procedure is not, I take it, what is being done with such statements, and it therefore misfires. First of all, you might kill a lot more than you intend, and second, you might miss what you would like to kill. So let me go a little bit over it again.

You would hold such a notion if you had a notion that women were people, i.e., that the category 'women' is the name of some people – when no such thing may have been claimed. The category 'women' is the name of a category, and the issue is, when is it that that category is appropriately possibly assigned to somebody? The fact that it may be correctly assigned is irrelevant to the question of whether on some occasion it *ought* to be assigned, as contrasted with something else, perhaps

The way things work is something like the following. We have our category-bound activities, where, some activity occurring, we have a rule of relevance which says, 'look first to see whether the person who did it is a member of the category to which the activity is bound.' So that if somebody does being fickle, or is observably being rich, you might then have a rule which permits you to select a preferred category for seeing who they are. And of course, using that procedure for finding the category, you may never come across occasions for seeing that it's 'incorrect' in the sense that the first procedure I suggested would end up showing.

Now, one consequence of that procedure's use is, if it turns out that someone is a member of some category, then what you have is an explanation. X is fickle. Why? Use the relevance rule. It turns out that the one who did it is a woman. Then you can say it's fickle because it's a woman, and women are fickle. One importance of these statements, then, is that they make some large class of activities immediately understandable, needing no further explanation. The statements are then to be seen as, heavily, 'explanations.' Where, not only do they provide possible explanations, but, on the occurrence of some activity, they tell you where to look first to see whether you have an

explanation, i.e., look to see whether the person who did it is a member of the class or classes to which the activity is category-bound.

It is the use of such a procedure which is the important thing. You might want to knock out this or that statement, thinking you would do away with the trouble it makes, where what you want to knock out, if you want to do away with the trouble, is the use of the procedure.

And the fact that it is the procedure that's being used, provides for some rather subtle ways of doing things like anti-Negro, anti-semitic, whatever else, activities. For example: There's recently been a campaign of sorts, protesting anti-semitism by the Russian government. And the Russians protest that they're not doing anti-semitism at all. And the issue is, how do they go about doing what they're doing, and why should it be seen as anti-semitism? Now, one of those sorts of statements we've been looking at is, let's say, "Jews are profiteers." The Russians prosecute some fellow for economic crime. One way they could do anti-semitism would be to say, "These fellows that did these economic crimes are Jews, and Jews, of course, do those things. They did it and it's just what we ought to expect." But what they also can do, which serves perfectly well to do that task, if that's what you want, is the following sort of thing. They don't claim to be prosecuting Jews at all. They don't mention that these people are Jews at all. They need only – at least for internal consumption – prosecute some people and then put out in a newspaper article, a list of the names of the persons who were convicted. Then, given the fact that everyone knows that Jews are profiteers, 'Jews' now being relevant to possibly explain who it is that did the economic crimes, one looks to the names to see whether they are Jewish names; since Jewish names are, among Russians, fairly identifiable, no claim at all need be made that these are Jews for everyone who cares to see that they are Jews to see that, and to see that what was done was something that Jews do. One has, then, an explanation of economic crimes which can be seen as living off of anti-semitism; otherwise the information is quite bland and unusable. And for some purposes information is often quite bland and unusable, unless you know how to inspect it in ways that are apparently irrelevant.

Now it happens that the fact that you have such relevance rules which provide explanations if they apply, has further importance since it's regularly the case that where the question is, among competing facts, Which has occurred? the one that has occurred is selected via the fact that it, among competing ones, has an explanation whereas the competing ones don't. And 'having an explanation' can mean that one of those statements applies. In some particular cases, that can be treated as quite illegitimate. So, I have an article from the *New York Times*; there was a big trial in New York where the judge threw out a conviction in an assault and attempted rape case and ordered a new trial for a 21-year-old Negro.

> The justice pointed to the testimony of one of the jurors who said that
> on more than one occasion during the deliberations remarks were made
> regarding the sexual proclivities of Negroes.

Where for some of the jurors the decision that this fellow did it could be warranted by the fact that there was an explanation available if he did it.

That kind of thing is extremely important, for regularly people can be puzzled how such a one who isn't graspable via some bound category could have done something, and it would be felt that he probably didn't, but somebody else did. So that if an activity occurs and the person who did it is not known, then those bounded properties permit one to know what the person who probably did it is going to look like, i.e., some properties of him – and therefore, perhaps, to search for him.

And note that if that were undercut there would be some very very serious problems. For example, if you look at the civil rights discussion and any of the literature relevant to it, you'll find that reports will say things like this: In the last year, in civil-rights-related cases (not legal cases, now) where there have been no convictions, 18 Negroes were murdered, bombed, lynched, whatever. Where, lacking the procedures we're employing, that could hardly be arrived at. All that we would know is that 18 persons had died, and there are a variety of properties which are true about them. The sheer knowing of the fact that this case is the case of a Negro murdered, much less a Negro murdered for civil rights reasons, takes some of these relevance rules as essential to the finding of what the hell is happening. And that you can then look to some white man who is a member of a rightist organization, for example, is not given by the fact that some X died who had certain properties, but that one sees that it was a Negro church burned, or whatever.

And many people who would like, for example, the information about Negroes to be undercut, to be said to be proved to be false by virtue of the fact that it isn't true about all Negroes, would find it very hard, then, to preserve such matters as that in fact Negroes have been murdered in the South, which they ought also to be able to say, and which follows as a part of the same apparatus. One has to be careful to pick one's weapons so that they don't destroy more than one would like.

Now it's also often said, by some of my more literary friends, that when you study things like this you're after all studying only the things that idiots say, or the masses, or something like that. First of all, I take it that when you hear, for example, of a civil rights murder, you perfectly well see that it's a civil rights murder, even if, when you hear somebody talking about Negroes' sexual proclivities you may say, "Well that's not true", and the same for any of the other substitutions. In fact, I take it, no matter how sophisticated you are, you use such procedures. And they're quite important to use. And, as I mentioned earlier, they're important in other ways than dealing with bad information, i.e., it's important to know that lawyers are rich so as to permit somebody who wants to be rich to know what to do with their lives.

In any event, if one likes such little games, one can collect, as I, in moments of harrassment have collected, statements of some of the most eminent of living or dead geniuses, which perfectly well satisfy the analyses we've developed. Because one really ought to see that what we're dealing with is not something that's restricted to the uneducated and that people with a college

education are freed from such prejudices as they are freed from using stereotyped information. Here is just one of the statements I've collected. It's a piece of testimony.

Questioner: Were you acquainted with Fuchs?
Witness: Yes, I knew Fuchs quite well.
Questioner: Did you have any reason to suspect his integrity or dependability or whatever was involved in the subsequent disclosure?
Witness: Not particularly. He was a rather queer person, but then under those conditions queer persons occur. I did not suspect him particularly. He was clearly not an ordinary person.
Questioner: What I'm getting at is whether you had reason to believe he was a Communist.
Witness: I think I did not know about him, no. I did not know about him. That he was a Communist, practically until the whole affair broke.
Questioner 2:   Practically what?
Witness: Until it became known. Until he confessed. Or rather, until he was shown.
Questioner: At the time you learned about it were you surprised?
Witness: Look. I was not surprised in this sense. That he clearly was a peculiar person. So if it turns out about an ordinary run of the mill person that he's a conspirator and spy, you are shocked and surprised. He was a very peculiar persons, with respect to whom I didn't have much experience. Of course I was surprised by the fact that there had been such a thing, that a spy had been so well placed.

That is to say, if you're told something and you know somebody's queer, then anything much they do is understandable. The piece of testimony is from the Oppenheimer hearings and the witness is John Von Neumann; surely someone who goes as among the great giants of our day, intellectually.

If one wants to propose that what I'm saying only holds for 16-year-old kids or people with less than a highschool education who read *Life* and *Time*, then I suppose it's only a misunderstanding. That is, that you are supposing that what I'm saying is that such information as "women are fickle," "queer people do anything," and things like that, have a character which I am not at all proposing that they have. And one also ought to get some idea about what reforms it would take, what you would want to do; which is perhaps, for example, to undercut the relevance rules, to say that if you hear certain activities done, don't look to category X, and things like that. It might pay to examine what else would happen once you changed one of them, and consider whether you would like to change it.

Lecture 9

Lecture 9 consisted of two distinct parts; the first part, pp. 1–8, dealt with matters carried over from lecture 8. The second part, pp. 8–12, started a discussion that was carried over into lecture 10. In this volume the appropriate parts have been absorbed into lectures 8 and 10, and there is no lecture 9.

Lecture 10

Pro-verbs; Performatives; Position markers; Warnings

I'm going to begin to deal with this statement from the data:

> *Ken* : I still say though that if you take if you take uh a big fancy car out
> on the road and you're hotroddin' around you're– you're bound to
> get you're bound to get caught, and you're bound to get shafted.

It's a tremendously complicated thing and I'm not going to give it what it requires. I'll begin off with some little pieces.

One of the questions we could ask concerns what it is that that first bit, "I still say though that . . . " is doing there. Is it to be seen as simply redundant, in the sense that the statement could perfectly well do without it – obviously he's the one saying it? Where one might take it that the statement might have been useful if he were talking about a past event and introducing a quotation of something he happened to have said earlier. Given, however, that it's a present occurrence, what is it that – focussing only on 'I say' for the moment – does, if anything.

I'm going to have to first introduce an unfamiliar term which, however, I haven't invented. The term is 'pro-verb.' Following is the statement in which I found reference to at least the existence of such a thing. It's from an article called 'On the semantic structure of language,' by Uriel Wereich in Joseph Greenberg (ed.), *Universals of Language (1963) page 126.*

> All languages have 'pro-forms' such as 'he' which substitute for other
> forms to avoid their repetition within a unit of discourse considered as
> 'the same.' But pro-forms are on the whole very unevenly distributed
> with respect to the parts of speech. Perhaps all languages have
> pronouns, but few have pro-verbs. English is perhaps unique among
> European languages in having, in 'do,' at least the rudiments of a
> verb-phrase substitute.

That is to say, roughly, that 'do' works something like the same way that more familiar pro-terms, i.e., pronouns, work. For example, in the uses that his notion restricts itself to, one might say, for the pronoun, "John put on his coat and he put on his hat," 'he' substituting for 'John' in the second clause. Alternatively, for 'do' you might say, "Mary baked a cake and so did Jane;"

Includes pp. 8–12 of lecture 9, Spring 1966.

'do' doing similar work, replacing 'baked a cake' as 'he' replaced 'John' in the other.

The term wasn't invented by Weinreich, and I don't know who did, and can't find out easily. It's clear in our data that 'do' works that way. And if you're interested in the historical development of this usage there's an article called 'The auxiliary "do": the establishment and regulation of its use in English' (which ends about the 14th century for this guy), by Alan Ellegard, in *Gothenberg Studies in English*, volume 2 (Stockholm, 1963).

What I want to do is develop what looks to me like another pro-verb. It's not as extended in its use as 'do,' and that is, 'say.' And the question is, first off, what is the class of things for which 'say' serves as a pro-verb? The class of terms that 'say' seems to serve as a pro-term for are at least roughly collected by Austin's notion of *performatives*.' There are two books, and they're books you ought to read. In his *Philosophical Papers*, chapter 10, there's a paper called 'Performative utterances.' Then there is a whole book about these things called *How To Do Things With Words*, J. L. Austin (Harvard University Press, 1962). They are things like, 'I promise,' 'I offer,' 'I bet,' 'I assume,' etc.; various activities that you can do in that form. That is, roughly, where something that you say is a formula for doing some activity; it's done in the saying. You can make a bet by saying 'I bet,' a promise by saying 'I promise.'

And it's extremely important that one restrict oneself to the first-person present form, i.e., one doesn't take all its tense and person possibilities. 'I bet' is altogether different than 'He bets.' 'I bet' can do betting. 'He bets' reports on something somebody is doing. So, 'performatives' are all first-person present. And in that way, 'I say' is very different than 'I said.' 'I said' can be introducing a quotation. Let me now consider what 'I say' can be doing.

What it seems is that for some of those performative verbs, instead of doing the activity with, e.g., 'I claim,' 'I assert,' etc., one can do it with 'I say,' where the hearer will perhaps put in the proper performative verb (if that's the way hearers do things). What one may then have is a weak, or a generic type of way of doing any of these things without specifying the one, though the one is ostensibly clear from the rest of what you're doing. That is, for example in this case, it being a 'discussion,' and one of the ways one participates in a discussion being to 'take a position,' one can say 'I say' when what one is doing is – if you want to paraphrase it – saying in effect, 'My position is,' 'I assert that.'

Now, the difference between 'merely saying' something, and doing what can be done with 'I say' are, among other things, the following. First, you're often making some commitment, in the case of a discussion perhaps, to defending yourself. Or to maintaining that argument. Or to answering questions if it's unclear. Or to living up to it. And, in that it involves a commitment, it may be very important who you're speaking on behalf of; that is, who is it that you're representing. "In the name of the United States I hereby claim this piece of territory." For any such thing it is an important matter who you're on behalf of, because if you're not properly on behalf of

something, then you can't do the thing you're trying to do. If you're not an official who is deputed to doing marriages, for example, you can say "I marry you" all day and you don't do it.

And in our segment, we just previously had a statement of the form 'We were,' i.e., "We were in an automobile discussion." And now 'I' can be, not merely in contrast to that, but the thing is being asserted on 'my' behalf, and that may be all it's asserted on behalf of. So it's when we get the character of 'say.' and what we could call the 'generic performative,' or a 'pro-term for performatives,' that we find that the initial pronoun, or initial affiliation, becomes quite relevant. For one, we might want to know where to go to complain. Who to address if we disagree.

Further, while if he were saying 'I said,' then you might say, 'No, you said something else.' But for 'I say,' if you wanted to point out he was wrong, you wouldn't propose that he doesn't say that; what you would want would be to say that the argument that he's committed to is wrong.

Now it's also the case that 'said' can have this usage. So, for example, regularly with kids, if somebody gives permission to do something, e.g., "Can I watch television?" "Yes," then comes back ten minutes later and says, "Turn the television set off," the kid says, "But you said!" Where they're not simply saying 'I'm reporting a quote of yours,' but 'You did something which involved making a commitment (one of this class which can be referred to by the term "say") and what I'm doing is invoking your commitment.'

So: So far I've been engaged in proposing that with 'I say' what's being done in part is to mark that the fellow who has started off his statement with "I still say though . . . " is making a position in an argument, where the first term, 'I,' has its relevance by virtue of the fact that for the class of actions which 'asserting' or 'making positions' involves, there's a question about on behalf of whom it's done. That question can be handled in various ways, one of them being that after some categorical term is used, like 'we,' it could be claimed, 'What's your entitlement to act on their behalf?' 'I' is a trivial case in this circumstance, since for the taking of a position, one is the best representative of 'I.' So, with 'I,' you solve the problem of asserting on whose behalf, and in using 'I,' have that warrant; whereas for other terms, the issue of representivity can be raised and is regularly raised.

Now we can get to 'still' and 'though.' These are general position markers for some type of activity within which the given activity is done. So if 'I say' is an activity done as part of some argument, or discussion that can become or is becoming an argument, then 'still' and 'though' are 'positional markers' within a discussion or argument. Their character is to be found via the sort of general activity that's being done, i.e., the sort of position they mark can vary with each activity. They needn't be done in combination, and in combination (i.e., as 'still . . . though') they can mark a different position than they do singularly (i.e., than either 'still' does or 'though' does). And they're not the only positional markers, either.

What sort of positional markers they are is something that can be seen as rough, but may well be as exact as one gets, or as one needs. In combination,

'still' and 'though' seem to mark the following. Whatever particular activity is being done within this general activity is at least a third activity of which some prior one was done by the same person. In the case of an argument, then, it's not a second statement. 'Though' alone can be a way of marking a second statement in an argument where the first is made by somebody else. And by 'second,' I don't necessarily mean this is his second utterance. I mean only that there's some prior statement by somebody else, where this one can be the first by the one who's speaking. So, for example, at some point in an argument where some person hasn't yet spoken, their first utterance may be introduced with something like, "You know what *I* think, though." Where, now, 'still' in combination with 'though' seems to serve to inform (if it's relevant to inform, and it's relevant in serious ways in this case) that one of those preceding positions was taken by the speaker and he's going to reaffirm it.

There are a variety of relevancies for using these markers in an argument. In the case at hand of course, we have a new person on the scene who hasn't heard the arguments before, and indeed, doesn't know that the argument is going to begin up again, but they might now go on to talking about anything else. With that beginning clause he's informed that they're back in the argument and that the position being taken by the person who is now going back into the argument is to be seen as something reopening it or continuing it and not starting something new. And it is to be seen as a reaffirmation, but not just a reaffirmation but a reaffirmation in the face of some opposition. And if the argument itself is familiar enough, it could routinely be available to the new entrant, on hearing just this fellow's statement plus his argument, that there were opposing arguments, and what the opposing arguments were.

There are other things involved in the use of these positional markers. One of them is that they involve a way of adding another activity to the given activity of making an argument. If he simply makes his argument again, that's one sort of thing, about which it could be said, e.g., that he's being, whether he knows it or not, stubborn or dense. But by introducing the positional markers which claim 'reaffirmation in the face of opposition,' he's providing for the fact that he does see what he's doing as 'stubbornly maintaining his position.' So, one way one can do being stubborn is the use of that combination of position markers. Of course they could be used wrongly in a variety of ways. For one, there may be no opposition. Intervening arguments may have been intended as supportive, or may be very weak, such that to come on being stubborn can make you look foolish (or it could be cute, e.g., if an infant thrashes around in a wading pool as though they're possibly drowning). But these things do seem to involve, then, a claim of the reaffirmation being a 'stubborn reaffirmation.'

So the phrase 'I still say though' does a whole set of tasks: It reintroduces the discussion as an argument, gives a great deal of information – or can – to the person who wasn't there before, and provides, at least for those who were there, that the position that was taken before is being stubbornly held to.

These positional markers are, then, one way that the character and the

relative where-in-it one is, in some kind of activity like an argument, is persistently affirmed. And indeed, the character of a discussion as 'an argument' is in part maintained via the use of these things.

Let me turn now to the long clause that follows "I still say though that," i.e., the statement, "if you're hotrodding you're bound to get caught," and give it an initial characterization. Roughly, you could consider it for now as a 'warning.' Now warnings are extraordinarily tricky matters. The format one uses for a warning can, with no change in what you say essentially, be used to do as well, alternatively or in combination, any of the following, at least: Threatening, predicting, advising, challenging, daring, promising. We'll have to work at how that can be so, and what the consequences of that are.

If you look at the next statement:

Al: Not unless ya do it right. That's the challenge– that's the challenge you wanna try and do it right so you don't get caught!

you'll see that if I'm correct that this was proposed as a 'warning' it was heard as a 'challenge.' And let's try then to do just that much, i.e., to show how a warning can stand as a challenge. Something like this seems to be involved: One of the ways that a warning is in part successful is if it brings the warned person to recognize that the activity that he's proposing to do, seems to be about to do, might do, is an instance of the class 'dangers.' But if you succeed in doing that, then that alone done, you've partially provided for the failure of the rest of your task – which is perhaps to bring them not to do it – by virtue of the consequences of something being a case of the class 'dangers.' For that class, quite independently of the issue of warnings, has a series of properties are that important.

The character of 'dangers' is, for one, that there are certain memberships that can only be achieved if one does something which is a case of the class 'dangers.' In its narrowest scope, the only way to be a hero is to do something dangerous. There are other membership classes which are larger than 'hero,' for which, while it may not be the only way, it's *a* way to get membership in them; especially if, say, one is close to, but not in, membership, and one has doubts about one's membership and others have doubts about it.

That's set up independently of warnings, but can mesh with warnings; i.e., the way you have something guaranteed as being a member of the class 'dangers' in the first place can be that somebody warns you not to do it. The warner tells you that at least for them as an audience, that activity is dangerous. They may warn you to get you not to do it. But if for you it's an issue that if something is proposed as dangerous then it's an eligible way to do those things which you can accomplish via doing dangerous things, then that provides the warrant for doing it.

Further, I think it is regularly if not always the case about categories for which membership is controlled by doing something dangerous, that they are from devices whose categories are *positioned*. So the category one achieves membership in via doing something dangerous, is the highest in the device;

where 'hero/coward' is an obvious example. Or, for example, 'men/boys' is ordered in just the same way: Doing dangerous things is what differentiates the men from the boys. And the character of 'dangerous things,' as providing access to the higher of positioned categories in any category which is bound to a dangerous thing is, I think, as good a criterion as you want for the fact that they are positioned. That procedure is not specific to this culture at all; it's quite general. Built into many 'native' cultures is just such a test, which consists of some way that membership in some higher-positioned category is proved via having done something which is, by definition, or recognized to be, dangerous. And the same holds here. So that we can see, then, what kind of link there is between offering a warning and having it heard as a challenge.

With that, there are some familiar ideas, which I for one don't readily understand, which I think can become clarified. One is the notion of 'ambivalence.' One can see, for example, how it is that warning somebody is something one can do via a combination of love and hate. Seeking to protect them and/or to drive them to something dangerous.

At this point we can come to see the systematic sociological basis for a notion like 'ambivalence' holding for an activity like 'warning,' given that warning is locked into these other things in a way that is perhaps not separable from them, and these things are quite opposite in their character. If, for example, there is something which, if you want to be a man you have to do, or if you have doubts about whether you are a man you might do to show it, then one can see what the strains are that are involved when a mother says, "For your own good, don't do it." And one can see the extent to which her warnings, which are of course seen by her as purely derived from her love, are ways of preventing maturity, maintaining the dependence, etc., of the object she warns – which, of course, if it refuses the warning, accepts the challenge, becomes a different object: No longer a boy, a man. As such, no longer subjectable to the same warnings. And that's of course a fact about dangerous things; they are differentiated. Things that are dangerous for one, are not for the other.

The motives of warners are, then, presumably always suspect. I don't mean that you have to be suspicious of them. What I mean is that the motives can't be clarified from the fact that someone has done a warning, in some exclusive way, e.g., if they did it then they must love you. Or if they did it then they must hate you. But they both can be present.

Lecture 11
'You'

I'm going to talk about 'you' in this sentence we're examining, but first I want to make a brief remark about another aspect of it, a phenomenon which recurs in the speech of this fellow Ken. There are two of them present here: "If you take if you take uh a big fancy car. . ." and "you're you're bound to get you're bound to get caught. . ."

> Ken :   I still say though that if you take if you take uh a big fancy car out on the road and you're hotroddin' around, you're– you're bound to get you're bound to get caught and you're bound to get shafted.

These things have been located; the term that's been applied to them is 'buildups;' they're very characteristic of rather young children, say, two years old. There is a brief discussion of them in a book called *Language in the Crib* by Ruth Hirsh Weir, pages 81–82. Presumably for young children they occur by virtue of the fact that the ability to build a sentence is quite limited, and you get a steady expansion from some small part to some larger part which is syntactically coherent with it. I suppose that would provide a rather technical way of formulating somebody's infantilism, if one cared to. (The Weir book is fairly new, but it's been enormously well received, and all the data that's used in the analysis she develops, is presented, phonetically transcribed.)

Now the discussion of 'you' that I want to work at involves dealing with, in its general character, a problem to which little attention has yet been paid, though it's quite clear, even for linguistics, that it's probably going to be a very important problem. The only relevant paper I know of for linguistics is 'A grammar for the hearer' by Charles Hockett by in Roman Jakobsen (ed.), *Proceedings of Symposia in Applied Mathematics*, vol. 12, *Language in its Mathematical Aspects*. It's on page 220, I think.

The paper itself is completely theoretical, but it suggests the kind of question I want to address, which is in part: Are there some sequential procedures used to detect which of possible alternative meanings for a word might be intended by its producer; which concerns, then: Is there some sequence in which a sentence is parsed, or come to be understood? Do Members wait until the end, do they stop in the middle, do they try to detect it all over its course? Clearly enough from what we've seen so far, there are plenty of places where people do not wait for the end, since there are some places at least where they interrupt and complete an utterance. To do that is something, presumably at least, approximately similar to the way that in relay

races, when somebody's about to go, he starts running before he gets the stick, and runs along for a while with the other. And one would imagine that the detection of sentences which are completed by some second person involves him in moving along to fit his remark in at some such point, and not waiting until it's completed or until the last word, to fit his own remark in. Something of this sort occurs in one of the therapy sessions where, were the second speaker to wait until completion of the first speaker's utterance, his own remark would not come off. They've been talking for a while about reincarnation:

Ken :   I was– I was on a road on the way to Rozwell New Mexico. An' I was, y'know, plonkin' along at a regular speed,
Roger : An' a grasshopper jumped onto the road who you recognized!

The issue of a possible sequence in which something comes to be understood, arises in part because of the character of 'you.' And I will consider some of the properties of that term now. In English, 'you' is in the first instance systematically ambiguous, in that it does not discriminate between singular and plural reference. And in that ambiguity, one has the 'this-and-that' format – a way of building richness into a compact form. That is, you get words which mean, not 'either-or' (where either you mean this *or* you mean that, and they don't have anything much to do with each other, but it's not clear which you mean on some given utterance) but, whatever meanings the word has, they may be carried. So that 'you' may mean 'you alone;' if it does not, then it means 'you *and* others;' but the ambiguity does not involve deciding whether 'you' *or* 'others' was meant.

Further, 'you' is the proper, normal way to address some other, i.e., in contrast to supposing that it's a substitute for a name, which it isn't. Now that may then serve to set up the following procedural sorts of possibilities. The alternatives are singular and plural, and perhaps there's some sequence in which those alternatives are gone through. For example, perhaps the hearer who hears 'you,' hears first 'me.' And if that doesn't work for some reason, he then goes to the next step which is 'me plus somebody else (or, some others).' That is to say, the second step in the procedure is an expansion, and not, e.g., an exclusion of 'me.'

That openness of 'you' means that 'you' can in fact be a way of talking about 'everybody' – and indeed, incidentally, of 'me.' For 'you' stands as a pronoun for the set of terms: 'everyone,' 'someone,' 'people,' etc. Here is some relevant data:

A: Why do you want to kill yourself?
B: For the same reason everybody does.
A: What is that?
B: Well, you just want to know if someone cares.

J :   I'm curious. I'd like to know what happens after someone dies.
R: You lay in the ground. They have a saying, you're planted.

A: You have a pretty strict conscience, haven't you? A pretty strict sense
     of what's right.
B: Well, everyone does.
A: No, not true. You don't think so, really. A lot of people sort of slip
     through life just doing what's easy.
B: Well, you have to think of other people, too. You have to think of
     their feelings.

I think it's pretty clear in these cases that 'you' stands as a pronoun for
'everyone.'

And then we can see a difference between the plurals 'we'/'they' and the
plural 'you,' which would account for the use of 'you as the pronoun for
'everyone,' perhaps. That is, the expansion from singular to plural 'you'
permits an indefinitely large expansion, whereas either of the other two plural
pronouns excludes the other. 'We' excludes 'they' and 'they' excludes 'we.'
'You' as it expands and eventually meets 'everyone,' excludes no one.

It comes to mean 'me,' indeed, also. And in the data above, it clearly
means, in the first instance, 'me.' But you come at 'me' in an especially strong
way. That is, you come at it by virtue of the fact that the hearer hears first
'you,' himself, and he knows it it's not only that, or maybe he doesn't think
it's even that, but his next step is not, given the way 'you' can be used, an
exclusion step (unless he says it's wrong), but an expansion. If he wants the
things to include 'you,' the speaker, in that expansion, then he gets to see
'you' as standing for 'everyone,' which then includes the speaker.

There are very good reasons for a speaker doing that sort of thing. A first
is, of course, if you're asked some sort of question which you know in the first
instance is one which has the sort of answers that you must defend when
you've given them, and you'd like to have an answer that has a built-in
defense for it, then one of the defenses would be to show that there's nothing
at all problematic about your answer. For "Why do you want to kill
yourself?" almost any reason can then be attached – proposing you're ill, or
whatever else. If you arrive at it via this statement being true for everyone, at
least perhaps everyone who is suicidal, then there's nothing special about you.

What's especially important to see is that if a speaker knows the procedures
the hearer uses to arrive at some way of deciding the reference, and what the
outcomes of those are, then he can of course drop in a term whose use he
knows, so as to get the hearing that he wants.

Now this last point can be dealt with, with related though somewhat
independent materials. In our segment of the group therapy session (third
page of the transcript) we find a very common kind of thing:

Roger: Ken, face it, you're a poor little rich kid.
Ken: Yes, Mommy. Thank you.

One could imagine that to "Yes, Mommy. Thank you" everyone turns
around to find out who's being addressed. Clearly none of them, and certainly

not the person who spoke, is the mommy of this fellow. How is it that the person who is called "Yes, Mommy" knows perfectly well that he's being called "Yes, Mommy"? How would we go about coming to show how that's so – again, in such a way as to see how the doer of that will not be seen as simply making an error. And indeed, if he were seen as making an error that would be interesting because if it were seen that he were making an error, then there would be at least the awareness that the name was not an appropriate one for someone who might expectably be being addressed.

There's a rather simple way of coming to see how that works. First of all, there are places within statements where terms of address can go. And given some of the paired statements (question–answer, for example), if you have a second of some pair, then to whom that second ought to be directed is known in the first instance, i.e., the answer is expectably directed to the one who asked the question.

Assuming for now that "Ken face it you're a poor little rich kid" is an insult, the fellow who did the insult is the one to whom some retort would be addressed. Therefore, whatever term may occur in what's to be heard as a retort, is in the first instance to be heard as addressed to him. And then the issue is, how is it that it characterized him, and *not*, given a term, find who it is that it might address, or if you can't find anybody treat it as an error.

The assessment of it as an insult-return can be made by the recipient; he can then take the given term and know that it's addressed to him, and know that everybody else knows that it's addressed to him, and also know that the person who used it used it knowing that he would hear it as addressing him. Which all can be done by virtue of the fact that the sequence in which that thing will be picked up is available to all of them – as in the case of 'you.'

One of the things that ought to be noted is that some sequence in which a hearer goes about doing the job of hearing is absolutely crucial to coming to see what it is that these people are doing with their statements and with the receipt of their statements.

Now it's also of course the case that 'we' has the same difficulties in its various uses. But there's at least a tactical difference between saying 'we' with the plural intention and 'you' with the plural intention. The difference is, if I say 'we,' that has some plural reference automatically. However, it does not automatically have a plural reference which includes the person being spoken to. It can be exclusive of the recipient. "We were in an automobile discussion" is 'we' in exclusion of the entrant. This possibility provides for a way of saying 'everyone,' which is: If someone who needn't include themselves in some class in which the recipient is a member – or someone else that the recipient is talking of is a member – wants to say in a stronger way than 'you' (which can be misheard as only the recipient) that 'everyone is that way,' they can say 'we.' For example, a woman is talking about her husband, who responded to an appeal of hers in something she thought was a rather hard-hearted way. And the psychiatrist is wanting to suggest that her appeal may have been not

clear enough, where she wants to suggest that her husband's response is evidence that he doesn't care.

> C: Wouldn't you think that if a person found someone that tried to commit suicide they would realize that it was serious.
> S: Sometimes people do, and sometimes they don't. Sometimes they need someone to tell them straight out. We can be very blind to the things around us.

That is, by virtue of the sequence in which 'we' is heard, the inclusion of the speaker is partially gratuitous; is heard as doing something he 'needn't have done.' Where, if you use 'you,' it in the first instance includes the recipient, providing for, in the above case, her hearing 'me,' which may be sufficient reference for the remark tied to it, and so not providing for the further step which would include the speaker. It is on the recipient's option or the speaker's intention – insofar as those coincide – that 'you' can refer to some category which includes 'everybody else.'

Furthermore, it is regularly the case that when I choose 'you,' speaking to a singular person I'm talking to, 'you' is not the singular of the plural 'you,' but the local representative of somebody I would otherwise refer to as 'they.' For example, one might say 'you people,' talking to some person or persons, who, were they absent, you would call them 'they;' e.g., 'You Negroes.' Where the issue of the use of 'they' is given via, say, the fact that for some device, I'm in one category and you're in another. My category, when I refer to it without a name, I call 'we,' and yours I call 'they.' When you're present, I say 'you.' Now in saying 'you,' I have that as an alternative to saying 'we,' in that the two of us present can regularly be referred to as 'we.' So what we get, then, is where I could say 'you,' I could also regularly say 'we,' and when I say 'you' in that circumstance, I will regularly be using 'you' as a local for 'they.'

One way to see that usage being understood, is that if I say to you in conversation, 'you,' you may well come back to me saying 'we,' exclusively of me. That is, "What do you think?" "Well, *we* think. . .,' i.e., you understand that my use of 'you' meant 'you as a member of some category of which I'm not a member.' And you then come back, qua member of that category, as a representative of it, rather than that 'we' now being inclusive of me. It can announce categorial membership being used. Since these uses are perfectly obvious and simple, you would have to suppose that a Member who produces that statement, and one who has to deal with it, also have some apparatus for deciding what's being done with 'we' and what it refers to.

There is a further point I want to make about pronouns, and we can get to it through a quotation I'll read you from *Language in the Crib* by Ruth Weir, pages 73–74:

> Of the personal pronouns the form 'it' has by far the widest occurrence, over 100, and is firmly established in the child's speech pattern.

Occasionally it is over-used as a substitute for a plural noun, at the expense of 'them.' The frequent use of 'it' confirms the child's classification of nouns into personalized and non-personalized classes as was pointed out. The non-personalized nouns permit substitution by the pronoun 'it' rather frequently, whereas the personalized nouns, including names of persons, favorite toys and animals, rarely are substituted for by pronouns.

The point I want to make is that I do not agree with talk of pronouns as 'substitutes for nouns.' In some ways, at least under certain very natural senses of 'substitutes,' that is obviously wrong. And as for others, it's a big issue.

If we treat the corpus of pronouns as they are conventionally treated, including terms like, e.g., 'I' and 'you' as pronouns, then in the usual environment of those terms it's an absurdity to say that they are substitutes for nouns, in the sense that the proper term to use in discourse when one intends to refer to oneself is 'I' or things like it, and not – except under very special circumstances – one's name – which would be seen as being used as a substitute for the pronoun. Now we could say that 'I' doesn't belong among the pronouns in the sense that were I to talk of the blackboard as 'it,' 'it' being a substitute for 'the blackboard,' that 'I' is not such a term. In the rules of conversation terms like 'I' and 'you' are the normal, proper terms and are not substitutes for some other terms.

We could say that pronouns serve as 'reference preservers' in the sense that they tie together some current piece of talk to some past piece of talk, and in some cases, to some future piece of talk. And they do that in a sense that the talk wouldn't be better if it were rewritten with the nouns that they 'substitute for.' It would often be worse. And furthermore, learning to talk involves that you learn how to put the pronouns in. And you can't, I think, sustain talk without them.

Lecture 12

Warnings, challenges, and corrections; Explanations; Complaining–Praising; Games

I want to talk a bit more, now, about *'warnings'* and related matters. One of the things one can perhaps dig out of materials such as the kind we've got (but I take it you'd need a considerable amount to do it) turns on the following sorts of things. The fellow makes a warning, and with it he might perhaps be engaged in threatening the other – if he does such things. And we might look to see what sort of apparatus he invokes in establishing his warning. Warnings can be done in dramatically different ways. I could say, "If you step across this line I'll punch you in the face," and that sort of warning might be seen as rather different than those which go, "If you hit me again I'll tell my father," and whatever further invocation of more or less massed power might be involved in getting up sufficient courage, perhaps, to warn someone. And one would like to see whether there is some systematic difference in the sorts of machinery invoked by various people doing warnings.

So, for example, there are two persons to this hotrodding warning, at least. But the person who hears it as a *challenge* is one who does warnings throughout this session – not in our segment but elsewhere, and he warns this very fellow here. But when he warns him, he warns him as a personal threat: "I will bang you around if you do something." Whereas, again, this fellow makes another warning, this time to the entrant, on the sixth page of the transcript, as the other two are preparing to 'judge the entrant's character.' He says, "You're gonna get killed" to which he adds, "Keep your mouth shut and don't say a damn word." Now again, the warning is not involving himself as the enforcer. And what exactly you might be able to say about people being systematically differentiated by the apparatuses they use to make warnings, I'm not sure, but it may well be that you could. Whatever case one wants to make, of course, needs be made from some data.

In that line of consideration, shifting matters a little bit, you might also consider the terms in which the external world is invoked in some speech. One might go through these materials to see, when people other than these participants, or when social organization, things like that, are referred to, how they are referred to. Is it regularly via warnings? If so, one has some of the

---

Starts with the last three pages of the original lecture 11.

sense that might be involved in saying that neurotics or psychotics see the outside world as threatening.

Whether either task is doable, I don't know, and I take it it would involve some larger corpus of materials, since you're making basically a statistical-type argument. But in any event, we oughtn't to stop by saying only that he made a warning and that he made it in a way that one can make warnings, but we ought to note a variety of other possibilities that are involved. For example, that wanting to make a warning, it may be the case that the best warning you can come up with is one which involves no less than the police power. Or, for example, that the ways for this fellow that the external world is relevant is as enforcers.

Some of the things that are present in this sentence I'm going to leave for now, and consider them when we get to this fellow's next speech, that long statement starting off with "In that Bonneville of mine." But let me just offer one for consideration. You might notice that there isn't any explicit indication that a crime was in fact committed. If you go hotrodding, you may surely commit a crime, but you don't only commit crimes, and of course most of the things that you can do while you're hotrodding are legal. But it seems quite obvious that the thing is presented, e.g., with the term 'getting caught,' as indicating that the arrest involved some illegal act.

And furthermore, the adequacy of the account that he gives is not undercut by any of the other participants, by, for example, suggesting that while you may indeed get caught, probably it wouldn't have been because you were doing something illegal. That is to say, the others don't see this fellow's explanation as inadequate. Rather does it seem that if you were doing something illegal and you got arrested, then not only is it the case that you got arrested *because* you were doing something illegal, but nothing much more need be said about the arrest. That can be contrasted to an earlier statement where they consider getting arrested without doing something obviously illegal, and use, to refer to the policeman who does it, that he "wants to be mean." Now that's something which is exceptionally interesting, and really worth giving a lot of thought to. I'll put the matter very generally or abstractly because at this point I can't present it in the kind of detail I would like.

It seems to be the case that types of explanations are ordered into layers, or domains, as one may please to call them. Some of these we would roughly call 'Members' sociological accounts;' others 'Members' psychological accounts,' etc., whatever the others may be. And it seems that there is some kind of substitutability operating within a domain. If a domain is relevant to an account, then there can be a strong version of the economy rule holding. And the strong version means that there can be *an* explanation which is *the* explanation, with no more needed or proper. Such that, for example, if the cop picks you up when you're doing something wrong, he picks you up because you're doing something wrong, and anything else added as an explanation is something that's not right to do. That is to say, it's not right to add such an explanation as, "He did it because it's the end of the month

and they have to keep up with their quota," or ". . .because he was nasty" or
". . .because he didn't like us."

Given the economy rule and given the domains, there may well be
exclusivity between domains, such that if some account from one domain is
relevant, accounts from other domains are excluded. That is, it's not that you
need one account from each, or several from each. If you have one from a
relevant one (or whatever number necessary from a relevant one), then you
may well exclude any from the others.

Those separations or those rules are enforced, and the penalties for violation
of them are very very serious. Let's say, for example, you talk in the following
kind of way and you see the world in the following kind of way:

A: Why would you get fired?
B: Why would I get fired? Because people are bastards. That's the best
    answer I can give you.
A: You mean it's some trouble between someone else and you?
B: No. It's trouble because of the nature of dishonest, corrupt, immoral,
    indecent people. People are interested only in themselves and the hell
    with the rest of the world. In other words unless they can make a
    dollar out of it they won't do a damn thing in the world.

If you talk like that, given questions like, not "Why did you get fired from
this job?" but "Why do you get fired?" then you're going to be heard as
'paranoid.' And that is a rather serious sanction controlling such movements
between layers.

Now the kinds of exclusion between layers, levels, domains can be more or
less supported by various kinds of institutions, such that courts will only hear
certain kinds of explanations as appropriate, and the like. And one can
perhaps lay out that the kinds of attacks that are formulated about Freudian
psychotherapy by Marxists consist of a pointing to the fact that some domain
(the emotions) is used exclusively, which is otherwise used by Members, and
also a very special unit of social organization (the family), and any other
accounts of troubles are excluded. Where what the opposition proposes is that
explanations for things like why X feels lousy, why he can't do various things,
are to be formulated by reference to, for example, his social position, the
structure of society in the sense of its economic structure, and the like. Let me
bring this home to you with among my favorite of all quotations. It's so
striking that I think very few people would propose it, but in principle it's the
sort of thing that everybody does all the time. It's from the *Washington Post*,
a kind of social welfare article:

Elizabeth was a bright, attractive 14-year-old who had grown up in a
house crowded with in-laws, brothers, sisters, nieces and nephews. Her
parents both worked and were rarely at home. Her older brothers and
sisters also worked, leaving the youngsters to manage for themselves.
No one particularly cared whether Elizabeth or any of the other children

got to school, needed anything, or were happy. They were just left there to grow up as best they could.

As a result of these conditions, Elizabeth became pregnant.

Such attempts can be revolutionary, not in the sense that they want to change the structure of the society, but they want to break some of the separations and some of the rules of relevance that decide what an explanation would be. You could perfectly well have major changes in the way an economy is organized without much affecting, perhaps, what it is that persons attend to as explanations for this or that, where they get them from, which of them they take to be exclusive of others, etc.

One of the ways of seeing how persons attend to explanations, etc., is to consider when, for them, is a problem seen. Following is a quotation with a similar cast to the foregoing. A teenage daughter in a family is having some troubles; a social worker went to the family and spoke to them, and is now reporting. At one point she says:

There's no father. Her father's been dead quite a few years and there's an unaccounted for, about three-year-old child in the home. . .

Now none of us take it that the social worker is suggesting the possibility of a virgin birth. An unaccounted for three-year-old child is a child for whom there is, not no father, but no husband.

What makes something 'unaccounted for,' and the kinds of things that would account for it sufficiently, completely, and exclusively, are then matters which we must very carefully try to get at. And I take it that there are very strong ways that those things get regulated.

Now I want to continue in part with the discussion of the 'warning,' moving, however, a little bit further in the conversation. What I'm going to say is extremely simple and obvious, but it will be of some use to see it and be able to use it, because it has some general applications.

Ken :   I still say though that if you take if you take uh a a big fancy car
           out on the road and you're hotroddin' around, you're– you're
           bound to get you're bound to get caught, and you're bound to
           get shafted.
(   ):   (//   )
Ken :   W'l look– I'm gonna–
Al :   Not unless ya do it right. // That's the challenge– that's the
           challenge you wanna try and do it right so you don't get caught!
Roger :   That's the problem with society.

There are two returns to the warning, directly. One is, "That's the problem with society" and the other is, "That's the challenge. You wanna try and do it right so you don't get caught." Now one thing that seems relevant about a warning – perhaps by virtue of the fact that warnings and predictions use

the same form – is whether the proposition it asserts is correct. And from the two statements we have, there are some very simple and very nice ways of seeing that Members accept the correctness of what might be a possibly correct statement. One very obvious one is that they complain about what's asserted. The use of a complaint (e.g., "That's the problem with society") can then be seen to be one way that a statement's correctness is accepted.

I want now to see whether that assertion – that a possibly correct statement is accepted as correct if it's complained of – can be generalized. One way it might be generalized is to consider some class of which 'complaining' is a member, and to see whether, for some class of which it's a member the other members also do accepting of the correctness of a statement, if they're used. One obvious class of which complaining is a member is a 'contrast class' in which another member is 'applauding'/'praising.' I assert that; I'll try to show that it's so because I don't want to rely on the fact that the dictionary says complaining and applauding are antonyms. Further, if all or some members of that set do, in part, the job of showing an acceptance of the correctness of a possibly correct statement, then we have a series of ways in which such an acceptance can be located, and thus, that a statement is seen as correct for Members can be warranted by us, i.e., we can point to the fact that it was complained of or applauded. There are, then, two kinds of related problems. One is to show that "That's the problem with society" is a 'complaint.' and the other is to establish in some way the kind of intimacy that we're proposing holds between complaining and applauding.

In the case at hand, the problem of showing that something is a 'complaint' is not much of a task at all. The character of "That's the problem with society" is not uninteresting, but it's clearly a 'token complaint.' If anything is a 'complaint' this is one, and it's simply recognizable as 'a complaint.' That is, it's a preformulated complaint. By 'preformulated' I mean that that statement, "That's the problem with society," on an occasion in which somebody wants to do complaining, can be used, and can be used about a lot of things that they want to complain about. It isn't restricted to a usage for the particular thing that was complained of here. And we needn't suppose that it was constructed for this particular complaint; it was simply invoked.

That's what we mean, in part, by 'tokens.' They are like money in that sense. If you want to do a certain thing that can be done with this, you do it with it. Now that matter has some very general import, as follows – and the point that I'm going to make is Parson's; at least he makes the observations, and it's a matter that he's attempted to deal with in his inimitable fashion. One of the nice questions that comparative sociologies obviously might want to deal with is: For various types of currencies, what kind of distribution is there across cultures? That is, if you can make a list of things that are doable via tokens in some place, how many of them can you find in any given other place, where those things will tell you a great deal about various kinds of social development. For example, it's obvious that if they have a token money, then that's a tremendously indicative fact about the kind of economy they have. Now there's no reason at all to restrict that notion to money. You

could perhaps find out a great deal by virtue of whether they have, e.g., token complaints, token praises, token etceteras. And also, of course, you'd want to know the domains in which such things can be used in any given society.

Tokens are especially well-formulated parts of a place. They are routinely used, and are designed for routine use. They don't have to be constructed at any given time, and the task of their acceptance does not turn on things like: Do you have credit at this place, or Do they like the item you've built, or Can they recognize that it's the kind of thing that passes? It may be that anybody can invoke them, and when they're invoked, what they're doing is perfectly well observable.

Now then, to the question of the proposed intimacy between complaining and applauding. It turns out that there is an intimacy, and it is extremely nicely used. In certain ways it's utterly crudely obvious, i.e., if you have a clear member of one, then you can regularly make a member of the other by simply negativing it: "He's nice" (praise, applause), "He's not nice" (complaint). That's altogether too obvious and simple and there are some less routine, perhaps much more elegant usages, but that one will provide in part for the alternation of complaining and applauding.

There's a kind of thing which some people do with immense regularity, which, if you ask them, they tend to say they're doing perhaps to soften the blow of a complaint, perhaps to show that they are not just complaining. But for our purposes what it ought to be seen as, at least in part, is 'signalling a complaint.' What they do are things like this – and the following three instances come from within about a minute and a half of conversation between two people talking about a bridge game; produced by the same speaker:

> *B*: Yeah. She said then will you look at your hand. I mean, she's very nice, but to me that's inviting you to gain.

Later on:

> *B*: I like her very much, but she still has that silly chatter about her.

And a bit later:

> *B*: Yeah, see we waste an awful lot, and I know– I think– Really, I love Theresa. I didn't mean that– her food was just outstanding. But I thought we were going to eat at the tables.

Apparently, then, routinely a piece of praise plus 'but' plus something else, tells you that the something else is a 'complaint,' where it isn't obvious, often, that it is a complaint. That is to say, isolated, it wouldn't be a complaint. You wouldn't recognize it as such if all you had was "To me that's inviting you to gain," or "I thought we were going to eat at the tables." (In the latter case, the problem was that this lady didn't want to stop the bridge game to have

a meal, and her complaint involves that while the meal was marvelous, it interfered with the course of the game.)

That thing is really extremely widespread. It seems to work the other way, as well: Possible complaint plus 'but' plus something else, tends to be used, I think, to signal 'praise.' "He really isn't very cute but he took me to dinner," "On first meeting one might think of him as gruff or aloof. However, in a short time his warmth and closeness to his family become apparent."

So I take it we can say that complaining and applauding stand in some strong alternation to each other. And of course under that circumstance, the sheer fact that we know that a 'possible fact,' if responded to by a piece of praise is thereby accepted as correct, is not now a matter independent from that thing about complaints, but is simply a rule formulatable by reference to that class of which complaining, applauding, and the like, are members. They are, among other things, ways of accepting the correctness of a possible fact, and we sociologists can use their use to propose that some possible fact is accepted as correct by Members.

And we can consider variations on the same sort of thing, which can turn on such statements as: "Women are fickle," return: "It isn't their fault." Where, if your concern is to deny the fact, then "It isn't their fault" fails that, in part. Where, then, things like 'excuses' and other such things work at the same sort of task, and we can then get ourselves a rather decent armory for seeing the sort of thing that Members take to be correct, at least on any given occasion some Member takes it to be correct.

Now the matter of the other fellow seeing the statement as proposing a challenge, seems to serve, in part, the same sort of work, but in the case at hand and for cases like it, what seems to be involved is that not all of the possible forms that that statement might be heard as, are accepted as correct. That is, the statement, "If you go hotrodding you're bound to get caught" can of course have a variety of interpretations. For example, just vary 'you' between singular-plural-everyone use. Given that "you're bound to get caught" could get various interpretations by Members, one of the things we want to be able to see is, which ones are they seeing, and which ones are they accepting.

When it's seen as a 'challenge,' it seems that what's involved is that it's seen via 'you' as a rather generalized term, and that "you're bound to" is not for any given case, but something like 'over the long or short run,' 'eventually.' Otherwise, again, if it's guaranteed that on any given try you will get caught, then there's no challenge

There's a certain beauty to seeing a challenge in such a statement. And it sets up some rather regular social problems of sorts. That is, if it's very likely that anyone who does it will get caught, then a game can be built under certain circumstances. Or, even if you don't fully build a 'game,' what you can do is set up circumstances where you can see that you have succeeded, and you can count each success. Where one has these sorts of statements accepted, then, one has machinery which permits you to score, and to tell others, and

they'll see that you scored, i.e., you did it and you didn't get caught. "I did it five times and I didn't get caught." "We did it twice that night and we didn't get caught."

A fairly full-fledged 'game' can be developed when that event that's troublesome (like getting caught) is the result of something that's done by some set of persons who operate under a set of rules that are laid down (the police, for example). And it doesn't matter if a set of rules are intendedly regulating the challenger's behavior, it can be read as regulating the behavior of the catchers. If the challengers then treat those rules as enforceable on the behavior of the catchers, then the catchers are bound by a set of rules that permit them to be players in an indefinite series of games. The thing becomes a game by virtue of somebody setting up another team which is going to treat the rules that intendedly, perhaps, regulate themselves, as regulating the others. They then set up a series of things they're going to do, via which they'll score, which they can compare each other on, etc., and which can work insofar as they can take it that, e.g., the police will abide by the rules of the game. The police sometimes buy this; sometimes it infuriates them. They can perfectly well know what's going on. It's the basis for complaints about having been arrested and convicted, perhaps, for doing something which you weren't in fact located by virtue of having done. You were located only because you were recognizable as an intended player in some game. They didn't let you play. They see you're a hotrodder, and they know, for example, that if they care to they can arrest you on whatever, and find something wrong with your car, and that will then provide for an arrest having been done in the first place. They do that, rather than awaiting that they catch you under the ways that they're 'supposed to' catch people. Where, for them, it isn't the circumstance that everybody is playing the game. If everyone were, matters would be altogether different.

Now this building a game out of such sets of rules which are binding on one set of parties (allegedly, perhaps, the 'wrong' set of parties), which can be publicly known, so that you have a rule book which doesn't tell both sides what each must do, but only tells one side what it must do, and therefore permits a game to be built (or a whole set of them) is, of course, a tremendously regular kind of thing, completely apart from situations with the police. There are problems, of course: No referees. Which is the issue that gets hotrodders into trouble, i.e., the police can violate and you can't complain. And of course the scoring is not exactly similar to the way scoring is done in games, i.e., both teams do not agree at the end of an evening that you scored so many, though the police may well on some occasion say, "You won this time."

And for a good game it's of course necessary in the first instance that there be another team and that they be doing things. No opposition, no game. T. S. Eliot's attack on modern sex in *The Wasteland*, center section, involves the destruction of opposition. The woman doesn't oppose, doesn't do anything, and then it's a quite different kind of phenomenon. You can't prove yourself a man that way. You can't score. Though you could tell your friends you did.

So it isn't, then, incidental where one is going to find systematic attempts at violations of certain sorts of rules. There has to be some very good enforcement procedure going on, where you're going to get sport made. And of course none of them see themselves as professional criminals; they are sportsmen. And it just wouldn't do to violate laws that nobody could see were regularly enforced. That could be an argument for various sorts of things – loose enforcement of the speeding laws, low speeding laws or maybe high ones, at least if certain matters turned out to be relevant, like the death rate among hotrodders is very high and you wanted to cut that down at all costs.

One further thing. On the matter of 'complaints,' there are several other things involved when one uses a complaint to accept a fact. One of them is, again, perfectly obvious and simple: The one who uses a complaint can be heard as making an identification of himself. And that is obviously an enormous control on making complaints. It may be extremely difficult to be able to formulate a complaint about certain matters without having a perfectly standardized identification asserted (e.g., 'traitor'). Under that circumstance, the counting of the amount of complaints versus the amount of applauses has rather serious weaknesses. Clearly enough, you can't do one, perhaps, like complaining, without having a certain identification, or some small group of identifications, placed on you in such a way that you can't readily get it off, and that itself may be relevant to the question of whether you do it or not.

And on the other hand, the way you get such a thing put on you may be either to complain or applaud. As a measure, then, of 'response to the fact' it has some weaknesses which are systematically built right into the very mechanism; that is, those other things that can be done with complaints or applause.

Lecture 13
Button-Button Who's Got the Button

I felt a strong need to take a break from the data which we've been dealing with. What I'll consider today will be the first in a series of interjected lectures, which turn out to be quite relevant to certain matters that are present in these materials. For example, I very roughly suggested the character of hearing the 'warning' as a 'challenge,' as being involved in seeing the possibility of a sport, or a game, in the situation of driving under certain regulations. What I want to do, then, in the series of lectures I will give occasionally, is to develop a formulation of series of the properties of *games*. And I'll try to point out now and again what aspects of the data we are dealing with, that they are important for.

I'm going, now, to consider some aspects of a particular game. By no means anything like all aspects of games, or all relevant aspects of that game. The game is called Button-button who's got the button – an enormously substantial phenomenon, you might imagine.

I'll start off by just going through how the game works, roughly. It's played by kids five to ten, and it works in the following kind of way. There's a set of people sitting in a row on a sidewalk or something like that. There's one person who is called It, and they walk down the row with a button concealed in their hand, and they engage in possibly passing it to each person in the row. Once a cycle is completed, the person who is It having possibly passed it to each person, then various people in one or another way, guess who has it. When the guess is correct, then that play ends and they begin again. There are alternatives that can be done; perhaps the person who guessed correctly is It, alternatively, the person who had the button can be It. They then proceed to do the same thing, and the game goes on in that way.

Now, I take it the game is tremendously interesting for certain sorts of tasks that are involved in it. That those tasks are learned to be accomplished via the game alone, I'm certainly not saying. That the game can be a large help, and that other games and activities like it can be a large help to learning those tasks, I think is so. That those tasks are altogether fundamental to becoming a full-fledged human seems, I think, to be clear.

I'm going to try to provide a characterization of what's involved in playing this game, or playing it well.

The problem for a person who is engaged in trying to decide who has the button – where that person doesn't have the button himself – can be said to be detecting, in what may be a series of alternative ways, from basically the appearance of the other non-It players, which of them has the button. The alternatives are, for example, very carefully watching the moment of possible

transaction and/or looking at them afterwards and seeing if there's some way to see that they do indeed or do not indeed have the button. Now the physical properties of the game are quite relevant, in that a button is not an incidental phenomenon. It is very small and thin, and can then be passed in such a way that when you see that someone has the button, you don't see the button. So we get a notion of observability which involves something like 'seeing that they know they have the button.' And the game, then, is rather different than a game in which, for example, a piece of food might be passed and one could smell who has it, or the object that was being looked for had some visible effect, like the hand was thicker than it might be if it didn't have the button in it; where, then the button itself would be the observable.

But what's core to this game is that one can observe that someone has the button, feel very confident in that, without having any observation of the button itself, and it's simply a failure of the passer or the recipient that it's the button that's seen and not their appearance which gives away that they have the button. So it's not the case, then, that the object is incidental to the characteristics of the game and that it just happens it's played with a button – though of course it is in some sense just incidental that it's played with a button; it could be played with anything that had the same physical properties. But it couldn't be played with anything that had different physical properties. Something that's thicker would not do the job and would pose a very different kind of game.

Now this sense of an observable thing – that one sees an appearance and sees, then, that something has been done – is of course in its fashion, the basic sense of 'observable' social phenomena. Especially for, let's say, moral phenomena. One can see that somebody did something wrong by looking at them. One can see who they are by looking at them, etc. Where it's not anything like the smell or the size of the particular object. And in that sense, the notion of 'observable' is that one sees their thoughts. That is to say, one sees the button by seeing that they know they have the button. If the button could be passed in such a way that they didn't know they had it, the game would be altogether different.

And this phenomenon of seeing other people's thoughts is really an important thing. Exactly how it's properly posed is quite tricky. First of all, it's of course nonsense to say that thoughts are things that can't be seen, unless you want to take some notion of 'thoughts' which Members do not employ, since they certainly do take it that one can see what anybody is thinking. Not in every case, certainly, but you can see what people are thinking, and there are ways of doing it. And you must learn to do it.

The question of whether you learn that others can see what you're thinking and you learn to see what others are thinking, or that you know it in the first instance, is what's problematic. I'll do a parenthetical series of considerations on that now.

One of the classical symptoms in certain kinds of schizophrenia is that the patient takes it that other people can see their thoughts, or know their thoughts – look right into their head. Adults who hear that take that as an

immensely queer symptom. And the problem, at least historically, was posed as: How is it that somebody would come to feel that others would know their thoughts? That's a very obvious way of posing the problem. Somebody says, "Others know my thoughts." How do they come to think that?

One of the early places, in at least the psychoanalytic literature, that that formulation was used, was in a very classic paper by a man named Victor Tausk, called 'On the influencing machine in schizophrenia.' It's been translated and reprinted several places, including *The Psychoanalytic Reader* by Robert Fliess and *Psychoanalytic Quarterly*. It was delivered in about 1917 at one of the meetings of the Vienna Psychoanalytic Society, and at the end of it there's a discussion. Tausk reports that he has a patient, a 16-year-old girl, and she has a very characteristic phenomenon which he discovers in her. He's talking to her, and she laughs at his questions. He asks her why is she laughing; she says, "What are you asking me questions like that for? You know what my thoughts are." And now he tries to formulate a solution to the problem, posed, as I've said, as 'how could somebody think that others know their thoughts?'

Freud is at the meeting where Tausk delivered this paper, and with what could be seen as a very characteristic aspect of his genius he says, "You posed the problem in completely the wrong way. It's not the case that what we have to explain is how is it that people come to think others know their thoughts. That's not the issue at all. The question is, how is it that normals come to think that others don't know their thoughts? And the character of the schizophrenic as 'regressed' involves the fact that either they never learned that others don't know their thoughts, or, having learned it, they are now back at positions akin to that of a child."

And he formulates the following kind of account (I'm not selling this account, I'm only offering it to loosen the matter up somewhat). He says, "After all, children learn their language from adults, and they must suppose that as they use it, adults know how they're using it, what they're doing with it, and can directly see their doing that sort of thing, i.e., thinking with a language," Now he says, "Well, what will be the sort of thing that would lead to the discovery that people don't generally or in all cases, know what one is thinking?" Then he says, "The first successful lie. What a trauma that must be. Or what a discovery that must be. You're asked a question, you give a lie, and they don't tell you you're wrong."

That's a tremendously interesting set of possible observations. And it makes very equivocal exactly how we're to formulate the state of knowing that others know your thoughts, or knowing others' thoughts. But in any event, it's clear that to some extent people take it that others can know their thoughts, and people take it that they can know others' thoughts, by looking at them.

Now, if we consider the game of Button-button who's got the button, we could imagine that very young kids who are playing it, and who take it that what they have to see, to make a decision, is the button, might discover that they don't have to use the button. That is, they could be spending their time

watching for the button, fail to see the button, and nonetheless see that, gee, they bet they know who has it – by whatever it is that seems to them to give that away. So it's the kind of game that may very well involve something that's in general terribly important, and that is that you can regularly – and children can – start off with quite lousy criteria for making a decision, be correct, and improve by modifying those criteria as you go along.

A very young child, for example, can have very good ideas on who's boys and who's girls, and have very bad ideas on what differentiates those two. Though in any given case they may make quite a good formulation of who it is – a boy or a girl. And that then involves us in a situation where there's a strong separation between the adequacy of one's criteria, and practical efficacy. That's of course, not simply at the basis of the possibility of improvement to some extent, but of, let's say, infantile socialization. And presumably a great many things like science tremendously depend on it. One can make differentiations which turn out to be wrong but have permitted you to locate a phenomenon that remains a phenomenon as you get better at deciding what it is or how it works or what differentiates it from something else.

Now in playing the game, one has to come to see that others can tell from your appearance that you have the button, and now you can make a tremendously important discovery, probably akin to what Freud was talking about as the first lie. And that is: There is something you can do which has an effect on whether they guess you have it when you have it, or guess you have it when you don't; and that if you do those things you get a variation in your name being picked or not. Where what that turns on is quite nice in the game. The core thing is the point of possible transition. One might suppose that if the kid were being altogether naive, then if he gets the button he'll respond dramatically one way or another, e.g., with joy or sorrow, at that split moment when he gets it. What he has to learn is, for one, to be prepared to control a response, depending on what happens – where he doesn't know in the first instance what's going to happen. That is, if he wants to be imagined to have the button when he hasn't been passed it, he has to be prepared to act as if he's got it at the moment of possible transfer. But if he's prepared that response too well, then if he does get the button he'll have given away that he does have it. That means he has to develop a control which is ready to work depending on alternative events – a control which works almost immediately.

The usability of appearance, then, to convey a false impression, is one of the basic tasks in playing the game well. It is, then, in part, a training ground for liars and deceivers. But it is equally well a game which is directed to the detection of liars and deceivers, since the category of player you are is regularly changed and therefore you not only have to learn how to deceive, but how to detect deception.

Furthermore, you have to learn that that which successfully operated once or n times is not guaranteed success, and in fact may well be assured failure, a next time. That is to say, if you joyously respond to the fact that you don't

have the button, and people take it that you have got the button and discover that they're wrong, then any next time they can learn your pattern and use it to see what you're doing. So there's no winning strategy that can be laid out on the basis of any past strategy. And then it's the character of the game as replayed constantly each time, which is rather crucial to training for both deceiving and detecting deceiving. Any successful method for doing either can be self-defeating if it's simply continued.

Now one of the serious things you have to notice about the game, and this holds to a very considerable extent for games in general, is the following: Recall, in the piece of data we're considering, Al says "Now did you do it right that's the challenge you wanna try and do it right so you don't get caught." One of the things we might be engaged in trying to figure out is, well, would it really be a proof that you did it right if you don't get caught, or, for that matter, would it be a proof that you did it wrong if you do get caught. If we took, say, science as our model, then it would be to some extent irrelevant, and certainly not definitive, that you did or did not get caught – for example, that you did or did not make a correct guess. What would differentiate a guess from a prediction would be that you have, and can offer, a good account of how you came to see that the person had the button, i.e., for one, how you came to do it right. Whereas in games, and in games like this one especially, it's asserting the name or getting caught that counts. And one can have the most elaborate or the least elaborate systems of accounts and they're irrelevant. Games operate under a test of practical efficacy.

And that's not a matter of theoretical preference for the players. If you lost, if people have called your name out when you've had the button, you have to suppose that they have some way of knowing it, and you have to modify your activities.

Now you can apparently also proceed play by play, have a notion of success that will serve you, figure that you're learning and improving, without operating in any situation where you could say "What I've learned now is sufficient for never losing." That is, at no point need you propose to test the adequacy of what you've gotten by saying "What I'm going to do is simply maintain the way I've got now of knowing how others look when they have the button, or of having others not know when I have the button, and I'll be right." In the game, that is one way of guaranteeing that you're going to be wrong, since it simply poses the problem for the others to see what pattern you're using and permits them to modify their own activities so as to foil it.

The fact that there is a shift of categories in each play, may be of some large relevance as well. Many games have that property: We bat this half inning, you bat next half inning, etc. And that involves, for one, that in simple games, each position is learned from both sides, so that a very important notion of categories and their characteristics is taught to kids then – if they don't know them beforehand. That notion is: Categories aren't persons. There's no equivalence either of one category – one proper person, or that a person has only one category indefinitely. This is a matter which they might well at some point in their lives not be apprised of and which might, then, involve them

in formulating, for example, activities as tied not to categories but to persons, which would be evidenced by their use of some activity characterized in a way that, for adults, would not be properly formulated. That is to say, where the appropriate category is not used.

You find, for example, in the younger children's stories in *Children Tell Stories*, that they seem to have basically just one membership categorization device – the 'family' – which they use to handle almost anybody in any situation there may be. Now that fact doesn't just happen, because adults allow them to do that. That is, children are trained first to use a single device, and the device is modified from its normal uses so as to permit its use to handle pretty much anybody. That is to say, the 'family' device has certain possibilities which permit its application to almost anybody. Certain categories can only have a single member in them – 'mother' and 'father' – but there are other categories – 'uncle' and 'aunt' – which in principle can have an indefinite number of members, and are taught to children as having that characteristic, so all adult males, or many of them, for some period of time, are Uncle so-and-so without respect to any formulation of kinship as adults would use it, and females are Aunt so-and-so. And in that way, the use of the single device is permitted and encouraged, and it's made into something that can handle almost anybody.

And what we say if that's so is, of course, that they're using the categories of the 'family' device as equivalent to personal names, where 'personal names' are in some way equivalent to, for objects, the name of objects. It's only in special circumstances that a table need be called anything else than a table. Whereas for formulating who's doing something, a set of alternative categories may well be extremely relevant, and one presumably has to come to see that a person can have a whole set of alternative ones. One very simple way is to have a rapid shift in those categories that hold for someone, where it wouldn't be odd at all that someone was It a minute ago and now is no longer It. That can be, now, a prototype of how it is that persons ought to be formulated, rather than that Mommy was Mommy yesterday and now she is no longer – where Mommy becomes stable by virtue of becoming a term of address in a sense, and thereby can retain its character as being used indefinitely perhaps, while one learns that there can be a series of other formulations of the same person, for others and himself, depending on what's going on. We get, then, the various sorts of category instability, where the stability resides in an appropriate category for an appropriate activity and not an appropriate category given some person having had it.

I have some indication that there is in fact a discovery procedure of learning a series of these matters, where they are, in fact, learned over time. For example, it appears that in games like Hide and seek, when young kids are playing, if they win once by hiding somewhere, then the next time they hide in the same place, and they have to be taught by the other players that that's not a guarantee of success, it's a guarantee of failure.

We could take these features and show that there are games in which just what works here, the opposite works there. So, for example, if in Button-

button what's important is to control one's future immediate response to possibly getting the button, then there are games where, if a person does that, that's a good guarantee that they're cheating. What they ought to do is to respond in absolute naiveté so that, for example, in the game Pickup sticks, if the sticks move then your turn is over. And it's not supposed to be the case that the other person has to decide that the sticks moved.

The game is typically played where the other person may be looking, not looking, paying close attention or not, and what they see is that you're watching the sticks very carefully, which is what you're supposed to be doing, and that you obviously react to the movement of the sticks. If they move, your face shows it. And you just drop the sticks; you don't have to wait to be called on it. In fact, in that sort of a game, if you're playing with somebody who you suspect is a cheater, all you have to do is watch the sticks, see if they move, and see if there's any response on the part of the person whose turn it is. If they don't respond, then you can be pretty sure that they are engaged in, systematically or not, cheating.

A few comments: This issue of the relevance of an appearance for attending what's up with somebody, and their capacities to control it and the equivalent capacity to check it out, is one that I can only very generally, very abstractly handle, because how it's ever done is something that first of all I'm not in a position to say. I don't know that it would ever be an issue for Sociology to say, as compared to that being a fact that students of Perception would deal with.

I make the point now, and it can be generalized to a lot of what I've already said, that once we get to an issue of a single device being relevant, then we have nothing to say. I have no idea how it is, and I make no claims to have any idea how it is. Once it's the case that Negro–white is relevant for some person, male–female is relevant for some person, somebody goes about detecting that that person is (   ) I'm not ever going to be saying anything about that matter.

On the orientation to appearances more generally; when I said that it's utterly central to being human, I had in mind the following sort of thing. In our Judeo-Christian mythology, the first event characterized as being human is a response to an awareness of an appearance. That is, the first event after the eating of the apple in Eden is just that event of being aware. The first thing they have. happen is being aware that they're naked. Before that they're not human, and before that they're not oriented to what can be seen by looking at them. So the matter has been tremendously focussed on, at least in such kinds of places.

Lecture 14
Disorderability; Tying rules

What I want to do now is introduce another order of consideration which is relevant to the data we're looking at, and then, directly, to conversation in general, and then indirectly to whatever activities one might want to consider, apart from conversation.

I have now and again made some remarks about sequencing, and one obviously relevant matter about activities, particularly conversation, can at least initially be posed as follows. First, to what extent is it the case that for any given conversation the utterances which compose it are not *disorderable?* And by that I mean only that, whatever it is that one might want to preserve or need to preserve so as to analyze what's going on, can one, for example, take any utterance, wherever it occurs, and place it somewhere else in the sequence for the same conversation? "We were in an automobile discussion" "discussing the psychological motives for" "drag racing on the streets." Does it matter that it goes "We were in an automobile discussion" first, "discussing the psychological motives for" second, and "drag racing on the streets" third? Or could you put it any way you want it for purposes of analysis, and perhaps for purposes of having produced a conversation. Now it's clear enough that there are some parts of a conversation for which it might be the case that it wouldn't matter. Suppose a new topic is introduced in some place in the conversation, and that topic goes on for some way and then closes, and then another begins and closes. It's possible, perhaps, that you could take the second topic discussion and place it before the first, and find that it makes no difference whatsoever. Or it's possible, perhaps, that you could take any utterance out of a conversation and place it any other place, or some other places, while losing nothing. That would be one type of activity. They happen to occur in sequence, but there's no *local control* over when anything happens.

Second, if it's the case that there's at least some partial non-disorderability to the utterances of a conversation, how is it that that non-disorderability is provided for? There are, at least a priori, quite different possibilities. Supposing some non-disorderability for any given conversation, it might be the case that the way that that non-disorderability is provided for is particular to the given conversation. Alternatively, there might be a more or less general set of rules which can be used to provide the non-disorderability of any conversation at all.

For some purposes, obviously, disorderability matters. When we talk about the fact that some statements in a conversation have to be understood 'in context,' one of the things we're pointing to, presumably, is that to treat them without respect to the problem of non-disorderability is to provide

perhaps for misunderstanding, or to make them altogether not understandable. That's a very familiar observation. Here's a quotation, a sentence President Kennedy once said:

Children should bury their fathers.

I suppose one could say, gee, that's a strange thing that fellow said. If one gets what he was doing, what it is that preceded that, one might feel that one was in a position to find out what activity he's doing with that sentence. In this case he happens to be dedicating a memorial to persons who were lost at sea during the Second World War, and he's trying to indicate the pain in such losses. The line I've quoted occurs in the following utterance:

It is, after all, against the law of nature for parents to bury their children. Children should bury their fathers. And when it's necessary for a father or mother to bury a son who may range from 18 to 28, with all of his life before him, it represents a special wrench.

The line itself, however, may not have any formal properties which tell you right off that it's being 'pulled out of some context.' There are others which tell you right off that they're pulled out of some context to which they have to be returned to find what they're about. What sort of line? How about 'Yes.' 'Yes' what? Look to the question above, perhaps, to find.

Now of course there are various consequences to treating properly non-disorderable statements as disorderable. One is, if statements are altogether disorderable, then they are apparently excerptable and quotable. And the issue of quotability has been a rather prominent one in many places. One can think simply of such matters as indicting somebody for some statement they made. But there are much larger considerations involved, and, in part, the difference between Aristotle's techniques of doing philosophy and Plato's turn on the fact that the character of a dialogue as a method of doing philosophy has as one of its central properties that the utterances of the dialogue are not properly to be pulled out and merely, then, treated as what this fellow thinks about a problem that this sentence happens to be about. In part it is that sort of fact that makes for the difficulty of analysis of dialogue, the sort of inaccessability it has, the possibilities of developing a position, and various other things.

Now if we look to conversations to see to what extent any one of them is disorderable, or not, and then ask, how is it that that disorderability or non-disorderability is provided for, we can perhaps come up with some rather general sets of rules whose use does the work of providing for non-disorderability. And if it's the case that we need some such rules and that if we had them they'd give us the non-disorderability, then, for one, we'd have a way of formulating some decent notions of 'context,' seeing that context is something that is oriented to by Members, and is not then simply a matter of, 'Of course it happened to happen at a certain time, so therefore you can't

remove it from when it occurred . . .' etc. In many areas there are significant attempts made to produce utterances which are not context-bound at all for their understanding. Obviously to some extent the whole science of mathematics is directed to that sort of attempt. And of course the very notion of 'truth' has such an intention involved in it, though there is a considerable amount of argument as to whether such a claim can be made.

Let's then just consider a little bit, a few of the ways that non-disorderability can be provided for, and then I'll offer some rather general considerations about it. I'm going basically to be talking about two classes of rules which provide for non-disorderability. I'll use the term I introduced earlier as a general name for these rules, *'tying rules.'* And the two classes I'll call first speaker rules and second speaker rules. Both of them concern pairs of utterances. The basic difference is, for the analyst anyway, that for first speaker rules, one sees, when looking at some utterance, that its user has made himself into a 'first speaker' for some pair, and has provided, then, that a next speaker ought to make himself a 'second speaker' for that pair. One starts with a recognizable 'first member of a pair,' where it may well be that if you don't know that there has been a first member of a pair you can't tell that the second is 'a second member of a pair.'The second members are not recognizable, the first are. The second are only recognizable given the fact you recognize the first and are therefore looking for a second. That is, the rule doesn't govern the first speaker's actions.

For second speaker rules it works the other way. You start with something recognizable as 'the second member of a pair,' and then turn backwards to something that is not recognizable as 'a first member of a pair' unless one has the second to see that there ought to be one. So first speaker rules provide for the proper tying of a next utterance to a current one, and second speaker rules tie some second utterance to something which may not have been produced as an intended 'first utterance' for some pair.

Now the use of these two classes of rules is not mutually exclusive. That is to say, a speaker can do both at once. He can make his utterance a 'first' for some next, while at the same time making it a 'second' utterance of a prior pair. And that's extremely important for the following reason, for example: One of the most obvious first speaker pairs is question–answer, the 'first' item being a 'question.' Now the first item, the question, can also be the 'second utterance of a pair' in the following sort of way. Suppose one person has said "My opinion is X." Then we could have a question which would say something like "Why do you say that?," where that's partially tied to the prior, and provides for another.

The theoretical core interest in those things is that if you can combine the two types, you can get right off, triplets, and an indefinite nesting of a conversation which ties all of its parts together in some extremely complex way, out of very simple pairs of rules. That is, you might well find that some item is the second for some first, and that that first is now tied to some other, and back, so that if you want to put a given one anywhere, you find that you have to put it exactly where it is – and not just following the immediately

prior utterance; it would have to come after the eighteenth utterance in that particular sequence. And all you need for that is, perhaps, two pairs of rules plus their combinability.

Now what are the sorts of rules? One obvious first speaker pair is, of course, question–answer. By using a question, a speaker makes himself a 'first speaker' and provides that somebody ought to be a 'second speaker' for that pair. It's routinely the case that questions are produced in such a fashion as to be recognizable as questions. There are a variety of means whereby that is done, which are, of course, not particular to any question. They are things like question-order in sentences – a different grammatical order than declarative sentence order, intonation pattern, and a series of others. There's a rather lovely book on questions called *Interrogative Structures of American English,* by Dwight Bolinger. It's publication no. 28 of the American Dialect Society (1957). And of course there are routine grammatical discussions of them in almost any grammar.

Let me pause at this point just to make a few remarks on questions; I don't intend this as a comprehensive discussion. It's occasionally or regularly argued that certain criterial features of questions, for example, in intonation, the characteristic rise, are present far less frequently than is regularly supposed. For a discussion on that matter there's an article by Charles Fries in a book called *Essays in Honor of Daniel Jones.* What Fries did was to listen to the television program 'What's My Line,' take all those things which turned out to be treated as questions, and try to write down their intonations, for one. He came up with a finding that only something like only 35 percent of them had the characteristic intonation structure of questions.

Now that doesn't necessarily mean that questions are problematic. One thing it might mean — and this is an extremely rough hypothesis, but my suspicion is that something like it is so – is that what's troublesome about that sort of analysis is that essential to the argument is a notion of the independence of any question from any other question. It seems to me from the tapes that I listen to, that the chaining rule for questions is terribly criterial to the recognition of questions. Such that the first question in a sequence will regularly be independently recognizable as a question by, for example, a very pure grammatical form and/or a characteristic intonation, but that once a sequence of questions is started, then it may well be the case that unless some next utterance by, say, the questioner, has a very clear non-question form, it can be heard as a question by virtue of occurring in a sequence of questions. Under that circumstance, i.e., that the characteristic of a question is to be found by its occurrence in a list that is hearable as being 'a list of questions,' it would be difficult to warrant an argument which counted them as singly independent objects.

Questions are, then, by and large, recognizable as such. And recognizable, then, as first items in a pair. Answers are not. There are extremely few answers which, if you simply have them, you know that you have 'an answer.' I once tried to see whether there were any utterances that could be said, simply by looking at it: 'If that occurs it may always — or overwhelmingly if not

always – be an answer.' And I came up with a kind of a funny result. I don't know whether it's really correct; if it's partially correct it has some interest, because the item that I tended to come up with was one that not only may well be always an answer, but it may also be an item which is almost always offerable as an answer, i.e., can be offered pretty much to any question that's asked. And that is the statement, "I don't know."

What's interesting about that is that it may permit us to partially explicate a rather fundamental historical fact in Western civilization. And that is, that "I don't know" as an answer, has played a unique role in the history of Western civilization. It was, of course, Socrates' phrase. And it served for him as a warrant for fundamental reconsideration of knowledge. It also was the programmatic answer he sought to achieve in any given dialogue, i.e., to get his respondent to offer.

Now, if a dialogue composed of questions and answers is going to be used in an attempt to reopen what it is that is to be allowed as 'knowledge,' it may not be, then, altogether incidental that the item that was used was one which can be offered for any possible piece of knowledge and is, then, general to any issues of knowledge. No other starting point might have that kind of universality to it. I've asked people whether in ancient Greek it's the case that "I don't know" is usable for any question – because it could perfectly well be the case that it's doable in English but not in Greek – and they said Yes. And if that's so, then we could come upon a rather nice basis for, in part, Socrates' use of conversation, and particularly of the dialogue, that wouldn't be independent of this item, "I don't know."

Let me turn to some second speaker rules. I suppose in doing these we could be getting into some kind of trouble with grammarians, but it's a trouble that with mutual decency can be avoided. But they by and large tend to restrict their remarks and analyses to the single sentence as a unit – or the clause, which could be equivalent to the sentence. And while they might propose that the rules they use are similarly restricted – and we'll propose that the rules for use in grammars are not so restricted – we could easily say that they might not be entitled to say that the rules are so restricted, since sentence *sequences* are rarely studied by grammarians, and we won't bother much about the use of the rules in single sentences.

Some of the second speaker rules are very conventional rules of English grammar – of a sort, anyway; though even they have been sometimes queerly treated by grammarians. For example, there's a rule like N ← P. 'N' is noun, 'P' is pronoun. The arrow is going backwards because, while 'N' occurs first in the sequence, we start with 'P' as the thing that tells us we've got a case of the rule, and we then look back to find the 'N' for that 'P.'

Now it seems to me perfectly obvious that that rule {N←P} is not restricted to a use in a single sentence. It can occur in a single sentence, clearly: John put on his hat. 'His' and 'John.' But it can be used across utterances, and across conversations. I'll show a very simple use of it across conversations, to give some idea of its importance across conversations. And with it we get one of the ways that we can even begin to dream of talking about 'non-

disorderability' for a history of conversations between some persons; a matter we would perhaps much like to achieve.

It's kind of a long quotation. It starts out with a mother talking to a little girl.

> The mother asked as if wanting to get things straight: "What are you going to say to Otto?"
>
> Maude said patiently, as if she knew what were expected: "I'm going to ask him if he can come over."
>
> The mother added firmly: "And you're going to say that you can't come over there if he asks you."
>
> Maude nodded acquiescence pleasantly and said: "Ok." She turned and ran quickly into the living room. She climbed onto a chair, stood on the seat, and leaned her tummy against the back of the easy chair. She reached up and took the phone from the top of the piano. She set the phone on top of the chair. Maude waited a moment staring absently at the chair back, then she absently said: "8–5." She looked over at me and asked curiously: "What are you writing about?"
>
> I said to her: "I'm writing now that you took the phone from the piano and said 8–5."
>
> She smiled and looked embarrassed. Suddenly she said: "Otto?" in a very demanding tone of voice. Now her attention seemed to be quite involved in the phone conversation.

It goes on and on. Then we finally get:

> Mrs Pinter called, with a little concern, from the other room: "What did he say?"
>
> Maude called back impatiently: "He hasn't told me yet."

We clearly have here two different conversations between the mother and the child. For one, there are two intervening conversations, one with the observer and one with Otto. (And one could in fact find the same sort of thing where the two conversations take place on different days, for example.) And in this case, we clearly have a use of N ← P (where 'Otto' is 'he') which is occurring between two conversations.

In the 11-page group therapy segment, many uses of this rule can be found which are not within a single utterance. Very largely they tend to be in juxtaposed utterances, but there are some characteristics which provide that they needn't be in juxtaposed utterances. For one, this particular rule has an indefinite extendability to it. That is, given N ← P, you can just continue with P, each P referring back up the sequence, and you can get long strings tied together from the first N; that is: N ← P ← P ← P ← P etc.

Lecture 15
Tying rules; Playing dumb; Correction–invitation device

I'll continue talking about these tying rules. My main interest is not in great long lists of them, because they're kind of dull things to make lists of, but in what they do. I'll consider a few; one can make, I suppose, hundreds more if one likes.

I've been talking about the second speaker rules, and I talked of them via the analyst's tasks, where for second speaker rules one begins with what is sequentially the second item but is recognizably the first that you can find. That's, then, the N ← P rule. Occasionally you can see in some noun usage that what you're going to get is a case of the noun–pronoun rule the other way, i.e., N → P. That would typically be within one single utterance. For an example of that, consider the line, "In that Bonneville of mine. I could take that thing out. . ." When you hear "In that Bonneville of mine" at the beginning of an utterance, you can be rather assured that in due course you're going to get a pronoun for "Bonneville." Now that's grammatically obvious in that what one has is a partial disordering of the standard form of the sentence; the utterance begins with a prepositional phrase where ordinarily, let's say, a sentence might close with it, and given that it begins with it, then when the object that's being referred to will be re-referred to, it will be re-referred to via a pronoun of some sort.

Now there's a function for that sort of thing, which is, for one, that reversals of some of these second speaker rules can be used to preserve the openness of an utterance, i.e., to indicate that at some point where it might be closed, it isn't going to be closed yet. And there are a variety of such uses. Another, for example, involves, not the use early in an utterance of a noun which looks surely like it's going to be replaced at some point by a pronoun so that you at least wait until that happens to find that the utterance is complete, but the early use of a pronoun – where it doesn't appear that it's a case of N ← P, i.e., a pronoun tied backwards. For example, in this statement, "Ken, face it. You're a poor little rich kid," where you have a reversal, starting with the pronoun, and in that way this statement is seen as not complete until what follows occurs.

The problem of preserving utterances as open is a systematically important one, given the fact, for use, that there are a variety of things that can stand – simply by, e.g., grammatical features – as complete utterances. Sentences can be complete utterances, and if one wants to build one and indicate that it's not a complete utterance, then there are ways of indicating,

in perhaps your use of grammar, that you're keeping the utterance open.

Now apart from the noun–pronoun rules of the second speaker form, there's a corresponding one for pro-verbs, which is verb ← pro-verb. For an instance of it, look at that statement "if you're hotrodding around you're bound to get caught," followed by "Not unless you do it right. . .you wanna try and do it right so you don't get caught!" Where 'do' is the pro-verb for 'hotrodding around,' tying the second utterance to the first.

On that use you have to be fairly careful, since 'do' is, besides being a pro-verb, an 'auxiliary,' and one can have a verb phrase with an auxiliary in it like 'do,' and have a second utterance which involves just the use of the auxiliary: "Did you bake a cake?" "I did," where the first 'do' was an auxiliary, and the second is now part of that auxiliary used to do that whole job of re-referring. There are lots of such things, in which a whole verb phrase which includes an auxiliary has a second use in which just the auxiliary is used, and that's another class of tying rules; for example, there's one which goes, "Eventually you'll become sane." Then, "Or your mother will," which is a next utterance tied back to 'will become sane' as the verb phrase. The use of the auxiliary to tie, and not the whole verb phrase, is, again, a very regular kind of thing.

To see that there are an enormous number of such rules, recall that at the beginning of our discussion of this data, I introduced the 'completer' situation, which was my first second speaker rule, i.e., a second speaker beginning his statement in such a way as to make his statement a dependent clause to what he makes an independent clause, but what might have been a sentence; for example, that business of 'discussion–discussing'. And if you take all the ways that dependent clauses can be built to make sentences independent clauses, you have a tremendous list of second speaker tying rules. For example, you can build something that stands as a prepositional phrase to a possible sentence. There's one that goes, "It's a good place to spend Saturday morning," where simultaneously, then, two prepositional phrases are built: "If you're stupid," and "after Friday night" (data handout, just below 9:30). So there are an enormous number of these type of second speaker rules which are formed of rules which have their supposedly typical place within a single sentence or single utterance. They need not at all be so restricted, and you can find them all over the place. There are also, of course, many first speaker rules: question–answer, request–return (acceptance or rejection, whichever it may be), command–return, insult–return, etc. If you go through a conversation, either building rules or just using rules you know, and then try to see how much of it is untied, it's a decent kind of exercise, and in the particular conversation we have, you'll find extraordinarily little that is not a tied utterance in one way or another.

Now there are rather different ways of deciding, perhaps, that you have something which is provided for by each set of rules. One way you might go about deciding that you have a first speaker rule item is kind of useful in that it suggests one consequence of first speaker rules which might not be altogether obvious. And that is, if you're dealing with a multi-party

conversation, then the use of a first speaker rule not only regulates properly the speech of the person who ought to follow it with some second part to that rule, but it also regulates properly, those who are not so told to speak. And one can see that in operation via the 'interruption' notion I offered earlier,[1] which is that if what we take to be a first speaker rule is used, addressed to some second speaker, then if somebody else starts talking before that second speaker does, and the second speaker begins, then one regularly finds that the person who started talking first stops, and allows the second speaker to proceed in conformity with the first speaker rule. Here are a couple of instances. In the first, A, talking to B, says "Hey don't tear him down." C says "I've been torn down for–," B says "Ok," and C just stops when B starts talking. Another one goes, A, talking to B says "And seven you've been arrested for rape and other things. Ha." C starts right after that with "Eight you–," B says "No, not that." C stops, and then starts over, after "No, not that" with "Eight you– Eight you give lip back to everybody."[2] And if that 'interrupter' situation operates, it's one way of seeing that you have one of these first speaker rules that provides for a second speaker to talk, and the sort of things he ought to do.

For the second speaker rules, one way to see if you've got something is to see whether you've got an ordinary grammatical rule operating within a sentence. One of the most prominent of the second speaker rules that you'll find in our data involves uses of 'that,' where 'that' seems to refer back to whole clauses. "If you go hotrodding you're bound to get caught" followed by "That's the problem with society." On this class of phenomena there's very little literature. About the only thing I can offer deals with a very special part of them, and those are things that could be called 'sentence connectors' or 'clause connectors,' which would go immediately in between two clauses, typically where the clauses could be whole sentences. Things like 'and,' 'that,' etc. There's a kind of a review article of sorts called 'English sentence connectors,' by Seymour Chapman in A. Marquart (ed.), *Studies in Language and Literature* (1954), page. 315.

[1] See Spring 1966, lecture 7, pp. 323–4.

[2] It seems that Sacks was working from his original 1965 transcript and not the one attached to the Spring 1966 lectures. Here are those two fragments from the original Sacks transcript:

Mel :   Now let's see what else can we decide about you?
Henry :   Hey don't tear him down
Joe :   I've been torn down for–
Mel :   ok
Henry :   We got company

Henry :   And seven you've been arrested for rape and other things. Ha
Mel :   Eight you–
Bob :   No. not that.
Mel :   Eight you Eight you give lip back to everybody.

Now, as I say, you can build hundreds of them if you like. The question is, what do they do – besides providing for, in part, the non-disorderability of the sequence of utterances? I take it that their fundamental use is that they constitute a relatively formal apparatus for a 'local check' – by which I mean at any given point – on the fact that what it is that's just been said, is understood. Now that's tremendously important. What we have is a machinery that's built in, that holds for any conversation and for anything that might be being talked about, that provides a demonstration and provides for work that will demonstrate, that a speaker understands what a last speaker says. Where such a demonstration does not involve time out from the conversation, i.e., building a meta-conversation like: "We were in an automobile discussion," then, "I take it by an automobile discussion you mean. . .", which is a theoretically possible way that one might have tests of understanding built.

With these things, let me work out some of the ways that the rules get used from the participants' point of view, so that we can see what's involved in their use. Taking a typical situation: In some utterance of A, some noun or some verb is used. In the next utterance, of B, one gets, not the noun or the verb, but, say, a pronoun or pro-verb. Now that involves, for understanding the second utterance, that one look, not, now, to what the term in it refers to in the world, directly, but that one goes back into the conversation to see what object in the conversation it refers to, and then see what *that* refers to. Thus, any second speaker, using one of these rules, first builds his utterance by performing some operation on some term of the preceding speaker, thereby providing that he has some idea about what the preceding speaker is doing; and now for the preceding speaker to understand the second utterance, the preceding speaker has to do the same job that the second speaker did. That is to say, he, himself has to see what that fellow means by 'it,' and find that, 'By "it" he means the thing that I referred to by "automobile discussion" or "hotrodding" or whatever else.' And then he can proceed. So we have a rather elaborate way that the two of them are checking each other out, and doing, in their conversation, ways of talking that require that those operations be done on prior talk.

So each part, then, of a conversation, becomes a piece of collaboration. One isn't getting a situation where, simply, A follows some rule and B follows some rule, but whatever rule A follows, B has now to inspect to see what rule he should follow, and that he followed it is something that A has now to check out to see what he should do, etc., etc.

Certain relatively trivial but kind of nice consequences of the use of this apparatus are that it makes a special task if you want to play dumb about what another person is saying. It can be quite hard to do it in a decent way. Quite hard because, for one, I'd like to see somebody try to systematically *not* use these rules in building their own utterance – let's say just the second speaker rules. Let's say you conform to all the first speaker rules as a second speaker. Just try, as a second speaker, to not use second speaker rules like the pronouns, the pro-verbs, the various things like 'that,' etc., etc. I think it's

extremely difficult to do, and once you use the pro-term, you give away your understanding of what they're talking about, even if you want to play dumb.

For example, we have an extended attempt to 'play dumb' in a conversation that goes something like this. The situation is approximately the following. A guy and a girl are driving around. They go over to somebody's house, a friend of the guy's. He's not home, but they meet the mother. He's away, having some troubles taken care of. They come out of the house. The girl says to the guy, "Tell me about those people." He doesn't want to accept that, so he says, "What do you mean, 'tell you about them'?" But the game is all over by then, since, that he knows what she's talking about is clear enough given that he's performed the operation on 'those people' to 'them,' where the sneaky part of the request was that there wasn't any 'those people' except by virtue of the fact that the mother is seen as a representative of the family, the family being the cause of the trouble, and known as such. What he really would have to say, to play completely dumb successfully, would be, "Who? Tell you about who? What do you mean 'those people'?" But she knew, and he knew, that the trouble was properly explained by the way the family behaves; that they got him into this. And in that case, you can see a single person, 'the mother,' as one of 'them.'

These tying terms provide, then, this constant local control on the fact that somebody understands what somebody else is saying. Each person being able to check it out, each person being forced to do the work constantly of performing operations on the statement of another, and then performing the very operations on his own previous statements, etc., etc.

Now there are lots of other sorts of tying objects. There are just 'tying terms' themselves. There are a list of 'tying verbs' which, when they occur, are then recognizable as second speaker uses. In this conversation, for example, you'll get somebody beginning their statement with "I agree." Then there are 'listers;' for example, in the series of questions, 'first,' 'second,' etc. So there's a great raft of those sorts of things that lock conversation together. Our problem is, at this point I could go through 35 of this rule, but I find it a tremendous drag to do. Let me offer one that is interesting, anyway. It's at least not so completely obvious. I won't give it abstractly, I'll give a perfectly concrete example.

A has a gun and is considering killing herself. B wants to know how come she has the gun, where did she get it. So he says, "Is it yours?" She says "No, it's my husband's." Now that sort of thing – and it's very generally used – I call a '*correction–invitation device*.' And the way it works is, we might imagine that a perfectly okay answer to "Is it yours?" is "No." Routinely for a certain class of questions, what one gets is not just 'no' or 'yes,' but 'no' plus – not simply the right answer, but an answer that stands in a strong relationship to the item used in the question. Where one sets up a special sort of problem by the item one uses in the question. It can be, for example, a request for a good reason why something is held.

For example, later on in that conversation B wants to know why A has the gun. He says "Is he a police officer?," where 'police officer' is now a good

account for somebody having a gun, and is to be replaced by, not simply "No he isn't," or "No he isn't" plus "He's a butcher," but "No he isn't" plus 'why we have the gun.' Where you wouldn't get, then, his occupation, if he isn't somebody other than a police officer who has a right to have a gun, but some other account of why the gun is had.

The item, then, in the 'correction–invitation' thing, is used as a 'possibly good account' for which, if it's not the answer, give me a correct good answer if you have one. Where you suggest what the sort of thing is that would be 'a good answer.' And in those cases, then, the item offered with 'no,' as the answer to the question, is tied, not simply to the item in the question, but it's tied via some much stronger kinds of constraints, such as 'co-class membership' of a sort, with the item in the question.

One other thing about the first speaker rules. Another way of seeing that you have first speaker rules concerns an issue which I mentioned earlier, and that is the special possibility of conversations of a form, not A-B-A-B, but A-A-B, for example, and that you could find those, and the way they tend to be found in the easiest fashion is where some first speaker rule is used, and no use of it by a second speaker is made – he doesn't say anything, for example or in any event he doesn't say what would be a return to that first speaker rule. Then what one gets is a repeat, where the repeat is not simply an extension of A, but A was complete, and now what we've got is A-A. And not simply a 'repeat,' but an indication that no B has occurred and that B ought to have occurred, i.e., that a first speaker rule was used. Trivially: "Hi." No answer. "*Hi.*" We would write that, not as one long A, but given that the first speaker rule items tend to be adequate complete utterances, on their completion we have the B. If we don't get it, and we get A repeated, we have A-A. Those are possible formats for conversation at certain points. And where they are operative, we can say that we have 'a first speaker rule item again,' where we don't have a way of otherwise saying that.

Lecture 16
Possessive pronouns; Possessables and possessistives

I'm going to begin talking about this phrase, "In that Bonneville of mine", first partially focussing on the term 'mine' in it. 'Mine' is of course one term of the so-called class, 'possessive pronouns.' I say so-called because the literal use of the notion that they are possessive pronouns made considerable trouble for more than a few analyses of the problem of possessions. Rather regularly, at least in the past, attemps have been made to formulate the notions of ownership in some tribe by considering the types, and range of use, of possessive pronouns.

A rather classic example, referring to earlier ones as well, can be found in Volume 5 of the *Southwestern Journal of Anthropology*, pages 169–189, an article by Capell entitled 'The concept of ownership in the languages of Australia and the Pacific'. What we have there is an exploration of, and an attempt to explain, the use of possessive pronouns with respect to ownable objects, and to derive what he calls 'psychological notions' of the differences in conception of what can be owned, how it can be owned, etc., as a way of accounting for the differences in the use of the possessive terms – possessive suffixes, possessive prefixes – for various objects.

That conception has been criticized somewhat justly by Goodenough (I say 'somewhat' not that the criticism is only in part just, but because the concept can be subject to much more serious criticism) in a very famous book entitled *Property, Kin, and Community on Truk*, Yale University Publications in Anthropology, no. 46.

Now Goodenough proposes that you have to determine conceptions of property independently of the possessive pronoun uses. And he offers some criteria for something being a possession which are not directly usable for our purposes, but I'll touch on them in a bit. What we want is to find out what it is that provides for the use of 'mine' – both in this phrase, and for such uses for other objects by other persons. I said "so-called possessive pronouns", and I said that the attention was over-literal to the name, because it's perfectly plain for English, and it's probably perfectly plain for most of the other languages about which such analyses have been done, that possessive pronouns are used routinely in ways which only absurdly can be considered to be 'possessive,' i.e., in the sense that one could say "I own that car." Before, however, we would say that we had a set of homonyms, only incidently

---

Includes pp. 1–7 of the original Spring 1966, lecture 17

having the same sound between, say, 'my' in "my car" and 'my' in "my country" or in "my brother", we have to see whether there isn't some important relationship between some of those terms and some of the different uses of them.

We could start by separating out some of the uses. So, for example, there is – in English anyway – a fairly clear 'affiliative' use of the possessive pronouns: When one has a membership categorization device category, to which one can attach a possessive pronoun, then what one is doing is claiming membership, asserting membership, in that category, or in a case of that category. "My family," "my country", and the like.

A second, sometimes related use, seems heavily to involve the set of relational pairs of persons, where if there is some relational pair between A and B, then either A or B can refer to the other by reference to one of the possessive pronouns, particularly 'my.' "My brother", "my doctor", "my patient", "my boss", "my child", etc. And if the warrant of the affiliatives is that one is a member, then the warrant of one of these is that there is such a pair, with incumbents, and that one is in such a pair.

Then of course there is the 'possessional' use of the possessive pronouns, with respect to, obviously, objects of possession. "My car", "my hat". And I'm sticking to 'my' for now, because the use of 'my' and the use of 'your' seem perhaps to be regulated in quite different ways.

What we then arrive at is: It is not the use of a possessive pronoun that tells you that the object it is used with respect to is in some way owned, but it's by independent determination of the character of that object referred to, that a possessional use is heard. That is, it is by virtue of the fact that something is, first, roughly a possession – and not, for example, a membership categorization device category or a relational pair category – that tells you, when a possessive pronoun is being used, that it's being used to note, claim, force, whatever, a possessional relation.

That then poses the task of determining what objects are possessions, recognizably so. And that being the case, we can consider Goodenough's criteria. One tendency of his in constructing criteria for deciding that something is a possession is to consider such things as: What use does the object have? Objects used as food are to be seen as possessions. How is it that the thing is produced? Objects produced by man's labor are possessions. One can have property rights, etc. Criteria like that.

There's no doubt that there's some sense in which those criteria have some real relevance, but there are large problems with those criteria. Our concern is regularly with recognition problems. And what we want are criteria that deal with recognition problems. I want to make a couple of distinctions, because of the character of the term 'possession' which seems necessarily to suggest that the thing is known to be owned by somebody or some group or whatever, and where we take it that it's individual things that are possessions.

I want to distinguish, now, two things. One, I'm going to call '*possessables*.' And that has its usual lay sense, i.e., these are things which you could, if you want, own. The other is a rather central class, which I'll just give a slight

twist-name to, '*possessitives*' – it doesn't have any intuitive meaning. My big concern is with 'possessitives' because they're the things that are crucial to the recognition problem. Consider the following event: Somebody's in a room, they pick up a hat, and they say "Who's hat is this?" How are we going to deal with the fact that they see the hat and, never having seen the hat before perhaps, and not knowing whose it is, and therefore in a sense now knowing that it's anybody's, they know that it's somebody's.

'Possessitives' are a class of classes of objects which, when cases of the class are encountered or talked of, they're recognized to be somebody's possession.

Criteria for membership in the class 'possessitive' can be worked out in fairly nice ways. And the criteria are probably not local to this culture. In a fairly offhand way, Goodenough, in his treatment of possible ways one can come to have possessions, suggests something that the analysis I'll develop could account for. Let me quote his remarks and then we'll take off from there. This is from page 35 of *Property, Kin, and Community on Truk*:

> If a man discovers goods which another has lost, he acquires full title to them, provided the loser is not a person who is known to him (i.e., a member of the same community or kinsman from another island). The discoverer is owner because he brings the goods into existence as property within the community of persons with whom he interacts. If the former owner is known to the finder, however, their relationship to each other is presumed to have been established already with respect to the goods lost. And the finder must return them or be branded a thief. On the other hand, if the loser is a stranger from another island, whose lost canoe, let us say, has drifted over to the finder's island, then the loser must buy it back from the finder just as though he were making a new purchase.

Now there's a kind of nice thing involved there. And it's nice in that it will give us some rather important socialization problems, which we well know to exist. And that is, that we can distinguish between things that can be said to be 'found' – and such things are 'possessables' – and things which, having found them, you find them as things that somebody has lost, i.e., where what you see when you find it that somebody lost it. Again, now, it's an item you've never seen before, necessarily. That is, you will know the class, but it's not by virtue of the fact that you see 'Johnny's hat' that you know that it's the hat that Johnny lost. (Indeed, even under that circumstance it's an interesting issue that, knowing it's Johnny's hat, you know that where you found it, you found it on the occasion of his having lost it, rather than, for example, that he threw it away. That is, you don't have to know that Johnny has put up a notice, 'I lost my hat,' to see that the hat you found is the hat he lost.)

So we're saying right off that 'possessitives' are things which, for example, when found are seen as having been lost, i.e., are seen as having been owned by somebody. That being the case, we can get an initial list of some of them

anyway, by going to Lost and Founds and seeing what gets turned up. Not everything that's found is seen as something that's lost. If you go down to the beach, pick up a stone, you can make it your own, it can become a possession. But I take it that if you turned the stone in at the Lost and Found, they might take it that something strange is involved.

And there are a variety of other properties that 'possessitives' have. Some of them can be used to acquire other property, i.e., they're generative. You claim something by putting a possessitive on it. You put a book on a table in a cafeteria, people take it that somebody's using that table. You can play games by seeing what sorts of objects you can put down there that do not interfere in other people's sitting at that table, and come to a differentiation at boundaries of the two classes.

That then gives us further kinds of considerations; for example, if you have a possessable that's not a 'possessitive,' then you have to be very careful about treating it so as to retain it, whereas if you have a possessitive you can be much more casual about it – drop it in the street, leave it in front of your house – and people will not thereby take it that if they want it they can just pick it up. Or, if they do, then you can well claim that they're thieves. You can leave a car in the street, it may be robbed, but you needn't fear that someone will figure by virtue of the fact that it's sitting on the street that it's available for whomsoever wants it. And with cars, of course, having their locus in the street, there is then the special problem of detecting that they're abandoned. Cars can sit for enormous long times on the street, intending to have been abandoned and not recognized as such. And there are classical stories of people attempting to get rid of an object, finding that it invariably pursued them unless they found an extremely good place to get rid of it, as it was regularly returned. Where, then, there are special places to leave things which permit others to see that they have been abandoned.

So you have a very strong sense of a difference. And that differences makes a nice discrimination in certain occupations. There are two related occupations – begging and scavenging – which involve quite different obligations and quite different activities. Beggars ask for things. For the things they acquire, they have to go through some operation of getting by asking. Scavengers are a much more independent sort. They go to those places where people abandon things, and pick them up. And in doing so they take on no obligation of thanking, or whatever else, the people from whom they acquire the objects.

Again, then, we do not get a list of particular objects making up the 'possessitives.' And there's no need for Members to have encountered that particular object before, nor for them to know whose it is, to know that it's somebody's possession. Though it's conceivable – but I doubt it – that on a very small island everything would be known in that fashion, i.e., one could always say about something one encounters, "That's so-and-so's such-and-such". And it will certainly be the case that a great many possessitives are understood to be possessitives by virtue of how they're produced, or by virtue of their uses. But that's an independent matter that controls, for one, how it

is that Members come to put a class of objects into the class 'possessitives.'

Now, I mentioned that the differentiation between the two classes, 'possessitives' and 'possessables,' gives us some rather important socialization tasks. That is, coming to see 'possessitives' and coming to know how it is that a possessitive can be acquired, free, has got to be learned, that is perfectly plain. And it's quite extraordinary how early that is learned in this society. I can show that by a little piece of data which I'll quote. The data is from a book entitled *One Boy's Day* by Barker and Wright (1951), pages 379–380. What they did was to have a bunch of people, working in half-hour shifts, follow a kid around all day, writing down as much as they could of what he did. They compiled, then, a record of his day. The boy is, I think, seven years old. He's been playing with a crate which is in a lot at which there was a house that burned down, though the lot is still owned by the owner of the house. The family is having dinner, and the father is talking about the crate:

F: What are you going to do with that big crate you have?
S: I'm going to bring it home.
F: You are? Don't you think we have enough crates and that kind of stuff around here?

The son doesn't give an answer. The mother then talks:

M: What are you going to do? Use it for a tent?
S: Yes.
M: Maybe Mr Nelson wanted it. Did you ever think of that?
S: No. He was going to burn it. He doesn't want it.

As you see, not "No I didn't think of that."

F: How do you know? Did you ask him?
S: No.
F: Are you sure?
S: Yes, I'm sure.
M: Was it there where they usually burn things, on that rubbish heap?
S: Yes.
M: How are you going to get it here?
S: I'm going to put it on my wagon and bring it over.

As you can see, the parents know how it is that the thing could be recognized as having been abandoned. Now, there are a lot of things involved; for one, certain intentions are taken to be 'intentions to give it up'. That is, it's not, if Mr Nelson wants to burn the crate, and puts it on the rubbish heap, he can then say "Well, I really wanted to burn it, I didn't want anybody who wanted it to take it." He seemingly has given up some of his rights over it. But the parents take it that the kid could have known how it is that this thing could be intended to be disposed of, i.e., that it was placed on the lot, and that the

kid can inspect the lot to see what things are available for anybody, and acquire them in that manner. But that if he hasn't acquired them in that manner, then he has wrongly acquired them – or wrongly intended to acquire them. And it's not necessary, apparently, to ask what the intention about the object is; if it's properly placed, the intention is available through the positioning.

There are, then, a large class of objects which when seen, or when talked of, are recognized as somebody's, or some unit's, and whose they are need not be known to know that. But we presumably don't need the distinction between 'possessitive' and 'possessable' as a notion, for the issue of how it is that possessional reference, in general, is heard. That is, when either a possessitive or a possessable is used in combination with a possessive pronoun, we can take it that that sense of the object as 'a possession' is what's being referred to. So, for example, when we get a phrase like "that Bonneville of mine", we have no trouble in determining that it is possessional reference that is being made. And of course we can't do that by such a fact as, it's a noun being used with a possessive pronoun. If we use that criterion – noun/ possessive pronoun – we get equally 'that brother of mine', and the like. And those are not the same sorts of things. No possessional reference is indicated.

Now I've gone through some of the ways that the possessive pronouns are used: An 'affiliative' use, in respect to some category of a membership categorization device, a 'relational' use, with respect to some relational pair, or category of relational pairs, and the 'possessional' use. And I've argued that one independently determines that some object is a possessitive or possessable so as to see what use the possessive pronoun has, and if the object being talked of is a possessitive or possessable, then one can hear the possessive pronoun being used possessionally.

But that's only to say that if we have that sort of object being referred to, then some possessive pronoun can be used possessionally – not which one, or how which ones are selected. There are a variety of ways and I want to consider a couple, one of which will give us a relationshp between several of the types of uses of possessive pronouns – most particularly between the usability of them affiliatively and the usability of them possessionally.

And that matter is fairly simple, at least to some extent. If, for some membership categorization device category, one can use a possessive pronoun affiliatively – one can say, for example, "my country", "my family", and the like – then, if there is some object which can be a possession for some class of those membership categories, then one can use at least the first-person plural possessive pronoun for that object, possessively. That is to say, if one can say "my country", one can say about something that's a possession of that country, at least 'ours.' "My country," "our bases;" "my family," "our house." (It isn't the case that one can automatically say 'my' for such an object.)

One can't routinely do that for objects which are seen as possessions of a correlative member of one of the relational pairs. So the fact that you can use a possessive pronoun for some category of a relational pair does not permit

you to use a possessive pronoun possessively with respect to something that is owned by the pair member, or is seen as a possession of the pair member. You wouldn't, for example, say, if it's my doctor's chair' that it's 'mine' or 'ours.'

Now one of the things we can see when we have some unit like 'country' or 'family' for which the object is a possession and we get this rule that permits one to use 'our' for it, is that it's routinely the case that that use of 'our' is one that a lot of people other than oneself can do, i.e., there are a whole range of people who can say about those bases that they are 'our bases'. When we get a use of 'my' for some object, what we have to decide is how that use of 'my' is arrived at, and when we get how that use of 'my' is arrived at, we can have some way of deciding whether there are others who can also use that 'my' about the same object. So, for example, if you hear some guy using 'my car,' and it turns out he is talking about the family car (where he can use that by virtue of the fact that if it's the family car he can at least say 'our' and perhaps 'my'), then it may also be the case that his brother can say, about the same car, 'my car.' So there may be a set of people who can say 'my' just as well.

That has, however, to be worked out for the sorts of objects, and the ways that those sorts of objects are seen as possessed. And the question of what controls the use of 'mine' is, in part, not resolvable by reference to, for example, a search of the legal title. It is, for a class of objects, to some considerable extent a problem of *address*. That is to say, it's a problem of who's being talked to. We get a tremendous instability in what possessive pronoun is used for a given object over the various pairs of persons who may be talking, so that 'the very same car' talked about by A, can to one person be referred to as 'our car,' to another be referred to as 'your car,' and to a third be referred to as 'my car.' That's all perfectly possible – and possible, furthermore, under a situation where no one of those people have title to the car.

It is often the case that the sense in which 'mine' is used, i.e., what other terms would be used in other environments, can be gotten by a hearer from the sort of object referred to by it. That is to say, if I say "my toothbrush," you who hear it can be fairly assured that there isn't any other environment under which somebody else would refer to that toothbrush as 'mine,' or I would refer to it as 'ours' or 'yours,' whereas for other objects you can feel assured sometimes that depending upon who's speaking, there will be environments when they can't say 'mine.' And that fact can be quite crucial. That is to say, if a kid says to another kid "my Bonneville," the other kid may well be able to know that the Bonneville he is talking about as 'mine' he can talk about as 'mine' talking to me, but talking to his parents, for example, he can't. And the relevance of that, roughly at this point is: Insofar as a car can be used to see the independent status of somebody, then if you know that they can't use 'my' for all comers about it, then you can feel that they're not independent for that item. That is, if someone says "that Bonneville of mine," somebody who doesn't know them can see, and say, "It's the car your daddy bought you."

Lecture 17
Pervasive, inexhaustable topics; Emblems

I'm going to continue talking about the phrase, "In that Bonneville of mine." There are a large series of issues, really quite central to this piece of data. I'll start off with a quote from chapter 1 of *The Nuer* by E. E. Evans-Pritchard. In that chapter he makes a whole set of observations parallel to the ones I've been making, and much related to the stuff we've been doing on the phenomenon of an 'automobile discussion' among teenagers. The quote is from pages 18–19.

> We have seen in a brief survey of some Nuer institutions and customs that most of their social behavior directly concerns their cattle. A fuller study of their culture would show everywhere the same dominant interest in cattle; for example, in their folklore. They are always talking about their beasts. I used to sometimes despair that I never discussed anything with the young men but livestock and girls. And even the subject of girls led inevitably to that of cattle. Start on whatever subject I would, and approach it from whatever angle, we would soon be speaking of cows and oxen, heifers and steers, rams and sheep, he-goats and she-goats, calves, and lambs, and kids. I've already indicated that this obsession – for such it seems to the outsider – is due not only to the great economic value of cattle, but also to the fact that they are linked in numerous social relationships. Nuer tend to define all social processes and relationships in terms of cattle. Their social idiom is a bovine idiom.
>
> Consequently, he who lives among Nuer and wishes to understand their social life, must first master a vocabulary referring to cattle, and to the life of the herds. Such complicated discussions as those which take place in negotiations of marriage, in ritual situations, and in legal disputes, can only be followed when one understands the difficult cattle terminology of colours, ages, sexes, and so forth.

Now there's a big problem with these observations. It's one thing to say that every conversation ends up about cattle, and another to show how that's so. And the point about a central conversational phenomenon and its analysis

---

This version of lecture 17 begins with a consideration first given at the end of the original Spring 1966, lecture 16 (pp. 16–17) and more fully developed in Fall 1966, lecture 5, from which the bulk of the discussion shown here is taken.

– for example, that it's due to everything being tied relationally to cattle – is obscure in that it supposes that in the end it would be some formulation of social relationships – economics, marriage, etc. – that is fundamental to the culture, so that they provide the sort of inevitable explanation one would come to. That is a very important theoretical issue. And that it is solved by him in this fashion – and by most of sociology and anthropology in a like fashion – is the sort of thing that permits him to say 'it would turn out that . . .' when it hasn't yet been investigated.

That is, one sees that something – like cattle conversation for Nuer – is important, it seems extremely pervasive. And now, before trying to figure out how and why it works as it does, one uses an acceptable explanation as that which the analysis would eventually and inevitably reveal. By 'acceptable explanation' I mean one need only invoke what's known to be such, e.g., 'social relationships,' as the stable machinery generating conversation, etc. And insofar as investigations end at the point when the explanation is in sight but hasn't been developed, then the notion that those things are the ultimate explainers can remain in use, and seem even to be confirmed. Whereas it's at least theoretically conceivable that, having examined the structure and working of these cattle conversations, one consequence might have been a discovery that the supposed explanation didn't do the job. We can't suppose that some end, being in sight that way, would inevitably be arrived at.

Evans-Pritchard does, however, point up that a topic can have a really pervasive character for a culture. Now the issue is not, then, to say that perhaps for kids, automobile discussions are like cattle conversations are for the Nuer. But perhaps there's a phenomenon – *pervasively important conversational topics* – which is present in both. Where what would perhaps be of interest would be that there *wasn't* such a topic.

One thing, which is not quite the same as the kind of point that Evans-Pritchard makes, is that these are topics which can be called 'ultra-rich.' There are different ways in which something can be ultra-rich as a topic. In the case of an automobile discussion, you can come on one of the ways by the following line of reasoning. You could say that a topic is 'limited' if there were, say, a finite set of things that could be said about it, in such a way that, as you were talking about it you were cutting into the amount that could be said, and thereby reducing what could be said some other time, so that at some point the topic is exhausted. By the term 'ultra-rich,' one thing we mean is that the topic is inexhaustable.

Now, saying that it's inexhaustable and finding ways of showing that it's inexhaustable are altogether different things. And in making the remarks I'm going to make now about its inexhaustability, I'm using other data than our 11-page segment, but in fact I'm using limited data, and limited data that I think will serve. We might go about the task of finding 'inexhaustability' along the following lines. Suppose we could say there were a number of finite parts to a car. And there are rather obvious ways in which you could say that, turning on the lists of parts put into a car. Now, if we imagine that, in part, an automobile discussion consisted of talk about the parts, and that, say, for

any given part there was only so much that could be said, then it would be at least arguable that, the parts being finite, the discussion of an automobile is, in that sense, finite.

There are two interesting properties of automobiles for hotrodders, which undercut such a line of reasoning, and provide a way of seeing the inexhaustability, i.e., the infiniteness of an automobile discussion for them – using now, a very conventional notion of 'infinite.' First of all, any part, perhaps, but certainly many parts, of any car whatever shape it's in, say, even right off the assembly line, is replaceable. And the second fact is that any replaced part is replaceable. That means that any car now – looking to the future – being considered, consists of an infinite set of parts, i.e., any part it has, plus its possible replacements. And all that we need, to talk about something being 'infinite', is that for any finite set, another can be added.

And that is quite different than the way adults talk about cars, and the way adults conceive cars. So if I, talking as an adult, were to say that I just replaced the engine or the tires or something else on my car, you might figure that there was something wrong with it. And that having replaced it, it was over. For kids, that's not so. Any part is replaceable without regard to the fact that it's in perfect shape, by virtue of the consideration, e.g., that a better part has become available, or by virtue of the current combination of parts that I have, some part is better than another part that I have, where all that is generative in the sense that the aim is to have 'the best car.' And the notion of that as a 'central motive' is something that we could work out eventually.

With 'having the best car' as a 'central motive', then if any set of cars that you're considering as equivalent, or possibly faster, get modified by having a new part put in, then that part is eligible for consideration in your car. You'll find in kids' conversations about cars, that the issue of indefinite replaceability of any part is routinely present, and it's present without the characteristics that replaceability has for adults. If a kid proposes to put a new engine in a car, the issue is not whether the old one was worn out. It's merely that a 'better one' has become available, or the kid can afford a better one, or someday will be able to afford a better one. In that sense, then, the purchase of any car is only the purchase of an object which is then to be considered in each of its parts, for indefinite replacement. And that is altogether different than the way adults properly conceive the cars that they buy. Where, furthermore, for the kid, each actual replacement is a matter that is discussable, and any definite positive decision is relevant for all participants. So that if A comes up with a good reason for putting 20-inch slicks on his car, I have to consider them for mine.

Furthermore, it's not any population of kids who know each other that constitutes the population for these replacements, considerations, and assessments, but it's perfectly legitimate to propose as a reason for replacement that you heard that somebody did it, or that you read that it's a good thing to do. And in that sense, then, the whole population of hotrodders is a group whose actions are relevant for any member of that population. And under that

formulation of the discussability of parts, with the parts having this infinite character, the topic can be seen to be inexhaustable.

It further appears that Evans-Pritchard's observation that almost any topic among the Nuer is one that eventually can come around to being discussed by reference to cattle is relevant here. Recall my earlier remark that there is a very large range of topics conventionally separated from automobiles that are discussable via automobiles – independence, sex, relations with the cops, how to prove yourself, comparability of persons, the state of the modern world, etc., which made it as ideal a topic as could be had, to serve for the members of this group as a 'cover topic.'[1]

Let me turn now to some issues by reference to, more specifically, the phrase "In that Bonneville of mine." For one, there are questions of the relevancies of alternative names that can be given to the same car. The 'Bonneville' is subsequently talked about as a 'Pontiac station wagon.' Earlier, that sort of car is referred to as a 'Daddy's car:' "Now the Soshes keep driving.[2] Daddy's car and everything" (data handout, first page). And the user of 'Bonneville' recognizes it, furthermore, as looking like "a damn Mommy's car." And now there could be a series of other types of references, each of which may have different sorts of relevancy for a variety of things. One, for example, is whether you can go drag racing in it. The speaker here takes it that you can. His colleagues, as I'll try to dig out later on, are rather insistent that you can't.

There's another set of alternatives which concern, whatever names you might give to this car, its position as a type of car among alternative types of cars: Bonnevilles as contrasted with Chevvies. That kind of car contrasted with hotrods. And that set of alternatives has another class of relevancies. I'll just briefly talk about those, and I'll begin by talking about a class of objects that quite obviously have the properties I want to consider.

There are a bunch of things we can talk about as *'emblems'*. These are things like medals, titles, and the like. They have several important properties. First, if you see one, see somebody wearing one, hear somebody addressed by one, and the like, then you can know the sort of procedure whereby they came to have it. And that you know the sort of procedure whereby they came to have it is crucial to the assessment you make of it. For example, that it's something they should be proud of or embarrassed about – proud of, in the case, say, of a medal; embarrassed about, classically, say, the mark of Cain, the clipping of ex-prisoners' ears, and things like that.

The availability of those procedures whereby they came to get them is, of course, independent of particular information as to how this fellow got that thing. One can know how people get such things, and be assured that not only do people get such things in such a way, but this fellow got that thing in such a way. That knowledge is, to use a phrase I introduced earlier, 'protected against induction.' And that it is, can be seen from the following

[1] See Spring 1966, lecture 7, p. 320.
[2] See fn 1, p. 396.

sort of colloquy: A says, "What did you do to get that medal?" B says, "Nothing." A says, "Oh you're being modest." In order to be seen as 'being modest,' one has to take it that what B replies with is not treatable as possibly undercutting one's knowledge of how it is that those things are acquired.

One wants to note, not simply in passing, that the fact that when one sees emblems, one sees them as having been properly acquired, can make for a little trouble for arguments about things like possessions having their character for Members as 'possessions' by virtue of Members knowing the way that they're acquired. That is to say, one doesn't know that that car is a possession because one knows that it was purchased; one sees it and sees that it is a possession. One sees, as well, that it was properly acquired, and the way that it is properly acquired is by being bought, and one doesn't have to check that out. Indeed, if one does have to check it out, there's trouble.

The fact that emblems are seen as properly acquired poses a series of possibilities which are, in fact, actualized regularly. Two correlative ones are: First, it's an opportunity for somebody to acquire the thing how they may, knowing that it will be seen as having been properly acquired. Having it is proof that you acquired it properly, and gets whatever might be gotten if you did properly acquire it. That clearly enough is a case of *subversively* using its properties. One can buy, and people do buy, medals in pawn shops, titles from mail-order universities, etc.

Now there's a negative aspect to the very same thing, and that is, for those things which, having acquired them, Members know how you acquired them, there have regularly been things that people can't, therefore, acquire. So, for example, it's important to, say, the development of modern capitalism that it became the case that one couldn't tell about somebody who has money, how they acquired it. Until that was so, there were large bodies of people – the aristocracy – who couldn't go into business and get money because it would be available that they were 'in trade' – something bad – if they had money.

The second correlate of this availability of how it is that something is acquired, is that if you want to go into the business of debunking, then, for any object which people know, and sanctionably know, how it is that such a thing is acquired, one need only seek out cases of its subversive acquisition and write them up. That's always of interest, and there is no shortage of books and movies on how it is that people really got Nobel prizes and the like. You can arrive at those sorts of things quite formally – and that provides an absolute set up for, e.g., having computers write scandalous literature.

Now there are lots of possessions that are very similar to emblems in this sense that we've talked about emblems. How is it that they're acquired is regularly available to Members, and they can use their knowledge of how it is acquired to see one as something you should be embarrassed about or proud of. We want to consider the case of cars, but for many other possessions it works in a similar fashion.

A given car, the car you have, is treated as a case of a set of possible cars, and the set of them provides those things from among which the given one was selected. Then, Members apparently know what different selection

procedures will come up with. They can then take the given car, construct or invoke the selection procedure that would come up with it and not some other, and see in a glance that that selection procedure provided for the purchase of this particular car, where the selection procedure may have a variety of further relevancies. We then need to consider, for one, what scope does the set of alternatives have for any given object? That is, what things are seen as possibly alternative to it so that they can be seen, perhaps, as having been rejected? What those alternatives look like, I can't really say. But I would think, for example, if you're wearing a beautiful ring, then somebody may perfectly well see, not that you chose among the set of 'rings,' but you might have chosen among the set of 'jewelry,' for example, and 'necklaces' might well be considered as an alternative that you could have picked.

Now suppose that one criterion for the class – though it's a kind of equivocal one – would be that if you start with some other item than the one in fact selected, you have available as an alternative to that other member, the very one you selected, i.e., you can get back to the one you selected. So that one can see 'cars' and 'jewelry' as not alternatives if, when you're wearing a ring, somebody doesn't feel that they can see that you turned down a car to get the ring. Again, this is without regard to how you in fact did it. You may well have decided to go on a vacation instead of buying a car. That's not the issue. If you go on a vacation, people may well feel that what's relevant is how come you chose to go here and not elsewhere. And of course that's very important for trying to make it in certain groups. If you saved up all your money to go on a vacation somewhere, then you may be able to pass as somebody who chose to go here and not there, rather than somebody who chose to go on a vacation rather than eat a month from now.

Let's get to these known decision processes by reference to kids and cars. In the first instance, whatever problems we might have constructing the alternatives for, say, an adult woman, we don't have for kids, since kids want cars. If a kid has a car we can take it that he wanted a car, where the issue is whether he wanted *this* one. And again, whether he wanted this is not a problem of psychology; that is to say, it's not a question of the sort that we have to find out if he wanted this car by asking him. He can say that he wanted the car, and you still know that he didn't want it. You can decide that he didn't want it without regard to asking him.

So there are, then, the set of cars that are going to be used to decide how *this* car was selected. There are a variety of formulations of car types, and those car types are formulated by reference to different membership categories. That is, there are, for example, 'Mommy's cars' and 'Kids' cars.' And again, the phenomenon of 'Mommy's cars' is protected against induction. It isn't the case that if you think that a Pontiac station wagon is a Mommy's car, then if you see a kid driving one you say, "I guess I'm wrong." You see 'a kid driving a Mommy's car.'

(In that regard, one might consider the set of scientists' sins, i.e., things that, as a scientist, it would be a sin to do. In this case, that you retain a theory over cases that are inconsistent with it, which a scientist doesn't properly do.

One might see whether, and to what extent, scientists' sins are not inventions of scientists, but involve the use of perfectly correct ways of reasoning, and sanctioned ways of reasoning, when one is doing other tasks.)

If a kid's going to get a car, then kids seem to know what sorts of cars a kid 'wants,' i.e., a kid ought to want, it will be insisted he should want, and he'd better want, otherwise he's subject to being seen as not having gotten what he wants, anyway. The others take it that they can see that that car was purchased by Daddy, and that the kid who's driving it only had partial say over what car he got. He would find himself walking around with a constant apology on his lips, i.e. 'I really wanted this.' It's a sort of apology that can be made for whole classes of things, in which your insistence is seen as over-insistence − or wrong, in any event.

Lecture 18
'Hotrodders' as a revolutionary category

Towards the end of the last consideration I was focussing on what kids take it they can see, when they see some combination of a car and a driver; where, as a rather minor point of what I wanted to get to, was that for certain cars, driven by kids, kids take it that they can see that that car was purchased by Daddy, and that the kid who's driving it only had partial say over what car he's going to get. And it's not only that a kid doesn't want a car that's going to be seen as 'a Daddy's car' or 'a Mommy's car,' but that even if a kid *wants* a Bonneville, then one of the things he has to consider is that it's going to be seen as 'a Daddy's car.'

Further, kids give some formulations of kids who drive Daddy's cars; for example, 'Soshe,' which is a term that kids use, by and large in a derogatory manner.[1]

But the problem is that these considerations don't at all get at what's most important about these phenomena. And that's what I want to try to do, though the analysis I'll offer has a much stronger sound than I could defend, at this point anyway. But I'll do it because something like what I'm saying is, I think, involved, and it's really fundamental to see.

We could work at it, in part, by asking a bunch of questions: Why do kids go about making up all these typologies of cars – and the typologies of cars that they have are really enormously elaborate: Daddy's cars and Mommy's cars, gassers, turbines, dragsters, plus all the names of cars – Fords, Chevvies, etc., plus various modifications of those. And they use those typologies to make assessments of other drivers; assessments which are not always nice. Why do they do it? Aren't the terms that are used before they go to work good enough? And what's the matter with them if they aren't? So that's the problem.

One way we can try to get at it is, in part, to try to see what kind of difference there is between the category 'teenager' and the category 'hotrodder.' I want to argue that they're fundamentally different types of categories; that 'hotrodder' is, in a very non-trivial sense, quite a revolutionary kind of category. And I'll just be trying to sketch some of the ways that that's so, and offer others like it.

Because I take it that the issue is really a very deep one, I'll give some

---

[1] 'Soshe (pronounced 'sōsh') seems to have been a geographically and temporally local derogative used by at least these teenagers for their more 'socially successful' peers.

suggestions about a type of category by taking a very ancient, and in its way famous, example – though most people don't know the example, so it's of some educational value, anyway. This is a quotation from Genesis 14. It goes like this:

> A fugitive brought the news to Abraham the Hebrew, who was camping at the terebinths of Mamre the Amorite, kinsman of Eshkol and Aner, these being confederates of Abraham.

In the history of biblical criticism, that's a most important little section, and its fundamental importance is at least sketched by the following kinds of considerations.

The phrase 'Abraham the Hebrew' is apparently unique in the bible, in that it's pretty much the only place that an Israelite is referred to by the term 'the Hebrew.' That term, 'the Hebrew,' is only used by an Israelite for self-identification to a foreigner, or by foreigners about Israelites. Its importance lies in the fact that, given the usage, 'Abraham the Hebrew,' biblical critics can feel that that section of Genesis was a segment taken from some document which had not been written by the Jews, and thus is some independent information about the historicity of Abraham.

Now categories like 'the Hebrew,' where the character of the category is that it's used by non-members of the category and not by members of the category except when members are identifying themselves to non-members, are rather fundamental kinds of categories.

Parenthetically, it's kind of a marvelous quirk about anthropology that an enormous number of tribal names that anthropologists talk of have this character. That is to say, the tribal names that the anthropologists write about are very very regularly non-recognizable to the members of those tribes and often mean things like 'outsider,' 'stranger' in some language other than the language of the named tribe. And that's because by and large if somebody is told of a tribe by a member of another tribe, they get the name of the tribe in the other tribe's language. So, for example, Elizabeth Colson, in an absolutely marvelous ethnography called *The Makah Indians*, traces such a naming. This is from page 76.

> They received the name Makah in 1855 when they made their treaty with the United States government. The government interpreter was a Klallum who gave the treaty makers the Klallum name for the Cape Flaherty people. This has been the official name for them ever since. Today most people speak of themselves as Makah though some of the older people say they dislike the name because it doesn't belong to them and they don't understand its meaning.

You'll find the same kind of reference at page 12 of Radcliffe-Brown's *The Andaman Islanders*, and it's a very very frequent thing.

Now we can say introductorily that there are certain categories which are

owned by a group other than those to whom they apply. A term like 'the Hebrew' in the ancient Near East was that sort of term. Right now the term 'Negro' is being treated as that sort of term. That is, the attempt of the Muslims is to treat the term 'Negro' as one which, if it is used, would be recognized to be being used by a non-member. And what's involved, roughly, is this: We could say that what dominant groups basically own is how it is that persons perceive reality, and that there's an order of revolution which is an attempt to change how it is that persons see reality. I don't mean that in a casual way, and I'll try to deal with it with respect to the difference between 'teenagers' and 'hotrodders.'

From time to time I mention the claim that psychoanalysis is a 'bourgeois discipline,' and propose ways to see the sense of such a claim. One of the ways one can formulate the sense of that claim turns on the way that psychoanalysis is concerned to defend the fact that adults own reality, against, first, what they call 'neurotics.' And Menninger has a magnificent phrase – he talks of neurotics as 'disloyal to reality.' What neurotics are, from the psychoanalysts' point of view, is children who can pass as adults. (And I think from the psychoanalysts' point of view, a psychotic is a retired child.) And what that involves is, of course, an attempt to refuse to recognize the claims to be dealing with reality on the part of, say, 'children.'

Now the fact is that there are tremendous revisions of history involved in psychoanalysis. One of the most striking is the business of the Oedipus complex. People regularly talk about an Oedipus complex as though what Freud says about the Oedipus plays is perfectly obvious. Whereas if you read them without first starting with Freud's way of looking at them, it seems to me, at least, that it's perfectly obvious that they're just about the exact opposite of what's proposed. They're perfectly clearly about infanticide, not parricide. And the parricide theme is, if anything, a rationalization for an institution of infanticide. After all, Oedipus is to be done away with by an oracle that precedes his birth – one would presume that, if anything, there may be some guilt about that. It's written for adults by adults; when he finally does away with his father he's already an adult; they know what they're doing, he doesn't know he's doing.

There are, of course, real problems that adults have to come to terms with about children, most of which are completely unknown, and fantastic in their character. One is, for example, that there is, in a perfectly good sense, a children's culture, with its artifacts, songs, games, etc., that is unbelievably stable. That is to say, if you look at a book called *The Lore and Language of School Children* by Peter and Iona Opie, there's good evidence that the songs sung by London school children 400 years ago are still sung, purely orally transmitted; transmitted without any officials taking care of them being transmitted; transmitted where the words have passed out of the English language. They are transmitted only by children – adults don't even know them. The same goes for a series of other phenomena.

There's enormous interest to how that gets done and what it might mean and what things like it might mean, for example, for reformulating the

relationship of children and adults. Instead of saying, for example, that adults are bigger and better versions of children, one might well treat them as alumni.

Of course it's very important that children have the kind of view they do, e.g., a notion of dependence, because, for one, presumably if children realize that they're not dependent in important senses – that is to say, the norms regulating the treatment of children are enforced by adults on adults, and whatever children did, adults would have to take care of them because they could be embarrassed, sanctioned, thrown in jail, etc. (and to be sure, all adults could renounce all children, but pretty much no given adult can renounce any given child) – they might come to see the enormous dependency of adults on children; for example, on the response that children give to them, like show them a little affection.

Now none of that stuff is officially recognized. It's not recognized in just the way that Marxists would say that the dependence of our culture on the laborer is not recognized. It's not only not recognized by those on top, it's not recognized by those on the bottom, either. And the kinds of revolutions that then try to take place are attempts to reconstruct how it is that things are seen, where the attempt is, in part, for some group to get to enforce a view of themselves by others, that they administer. And a big difference between the categories 'teenager' and 'hotrodder' is that 'teenager' is a category that adults administer. What's known about those things, 'teenagers,' is enforced by adults. And of course parallel things hold for the Negro.

What I'm suggesting is that a notion of independence is trying to be asserted against the notion of independence now being enforced. The notion of 'independence' that's held for, say, Negroes and children is, in a radical way, asociological: They should become independent one at a time. And by following the ways that are defined by the dominant culture. Be a good boy and grow up, keep clean, get a good job, you can do it, it's your problem. That formulation of independence is enforced by the adults. Can some way be found whereby independence can be internally administered? There are simple and trivial solutions that people sometimes come up with, but they're in that genre. The attempt, say, to buy a state by the Negroes is that kind of an attempt – they'll define what makes for success.

What's needed, in part, is to bring about a change in what it is anybody sees when they see one of these things. And then to be able to control what they know about one when they see one. Where the question of how you could control this is, of course, an extremely complicated one. Kids know that if they're in cars they're going to be seen as 'teenage drivers.' I've talked about this phenomenon before, i.e., a kid in a car is seen as a kid in a car and not something else, whatever he could be seen as. There are a range of categories other than 'teenager' that somebody who's a teenager could be seen as. What are thé occasions under which one or another category would be chosen uniquely? If somebody's in a car, and that somebody could be seen as 'a teenager,' then they're seen as 'a teenager.' Now what can kids do to shift that around, or to begin to modify it? Again, what we want to have is a set of

modifications that are administered by members. And that means, for exam-
ple, that *they* will recognize whether somebody is a member of one or another
category, and what membership takes. And *they* can do the sanctioning.

And the character of the sanctioning does not need to involve at all that
anybody gets together and beats somebody up. But how it is otherwise
enforced is most extraordinary in a way. It used to be the case, maybe it still
is, that sportscar drivers flicked their lights when they passed each other. A
Volkswagon driver might flick his lights at a sportscar driver and be
absolutely ignored. Now it isn't that if a sportscar driver flicked his lights at
a Volkswagon somebody would put a bomb in his car, but it was his business
to defend all other sportscar drivers on each occasion in which somebody who
wasn't properly a member flicked his lights.

That's much related to drag racing in the streets, because although in this
little story that the fellow tells, he pulls up in a Bonneville, another fellow
pulls up in a Bonneville and now they have a drag, while that's conceivable,
if the hotrod culture is properly enforced, then if he does it to anybody else,
they just won't drag with him. They will not accept him as a proper person
to drag with, no matter how fast his car is, or whatever else. It's not a car for
doing drag racing.

Now what they do, in part, are kind of simple things. For one, everybody
by and large, including 'teenagers,' simply take the car they get, and drive it.
When you get the car in one or another way radically modified so that it's not
strictly a Detroit car but something worked over by the kid, and get the
notion 'hotrod' applied to it (with, of course, the possibility of subversion
already present, i.e., that you get a hotrod built by some company specializing
in fixing up cars), then, for one, adults don't drive them – or proper adults
don't drive them – and anybody who sees one needn't wait to see who's
driving it, adult or teenager; they know it's 'a hotrod' and there's 'a
hotrodder' in it. And what is known about 'hotrodders' – what they do with
their cars, how they look, how they otherwise behave – are things that
hotrodders can enforce on each other to satisfy. And since hotrods are used
only by kids (or adults 'disloyal to reality'), and once you have one what
you're going to do with it is play with it, you become tremendously
dependent on others' willingness to recognize that you have one, and what it
status is ('good,' 'the best,' 'rotten'). Once you make yourself a candidate,
then you subject yourself to the controls that the set of members have and
enforce.

Further, one can begin to see the interest of kids in sanctioning kids driving
ordinary cars, since those permit the retention of the 'teenage driver' category,
with all that's known about it. Also, there's a way in which some of those kids
are now doing what we don't even have a category for. That is to say, we
don't have a psychiatric category, like neurotic or psychotic, for something
like 'fink.' What it is, is somebody who's disloyal to a lower group. I don't
know why there's not been a psychiatric category for 'fink' and 'scab' and
things like that; it's kind of an interesting problem. But consider that long
utterance which follows "In that Bonneville of mine:"

> *Ken:* In that Bonneville of mine. I could take that thing out and if I've got a tie and a – a sweater on and I look clean? ninety nine percent of the time a guy could pull up to me in the same car, same color, same year the whole bit, roar up his pipes and he's in a dirty grubby tee shirt, and the guy'll pick the guy up in the dirty grubby tee shirt before uh he'll pick me up.

What's being proposed of course is that I could put on the appearance of a nice kid teenage driver who doesn't drag race, and do it, and the cops wouldn't get me. That is, I could look like I'm loyal to them while I'm really being loyal to you. Where of course they take it that that's just talk, that what he is, is being disloyal to them.[1]

Now one of the things we have to see, that sets these sorts of tasks into a framework of their real possibility, is this: We're dealing in the first instance with a category. They're not 'groups.' Most of the categories (women, old people, Negroes, white and the like) are not 'groups' in any sense that you normally talk about groups, and yet what we have is a mass of knowledge known about every category, and any member is seen as a representative of each of those categories, and any person who is a case of a category is seen as a member of the category. And what's known about the category is known about them, and the fate of each is bound up in the fate of the other. So one regularly has systems of social control built up around these categories which are internally enforced by the members, because if a member does something like 'rape a white women,' 'commit economic fraud,' 'race on the street,' etc., then that thing will be seen as 'what a member does,' not what the person with that name does. And the rest of them will have to pay for it. And somehow these categories live with that problem, by and large. They go around telling each other "remember, you're a lady," "remember, you're a

---

[1] [This note was added by the transcriber at the time the lecture was transcribed.] Here is another story told by the same kid in another session, at which the other two boys are not present. In this case, the proposal seems to be that he's putting on the appearance of a normal everyday car and its normal everyday driver while he's really loyal to another category perhaps similar to hotrodders, i.e., surfers.

> *Ken:* In Mammoth my Jeep I've got surf stickers all over the back windows you know?
> *Louise:* Mm//hm
> *Ken:* An' up there they <u>hate</u> surf. Surf is the lowe//st thing,
> *Louise:* Oh I <u>know</u> that. heh
> *Ken:* in the world. An' all the adults frown upon it, the kids hate'em, they see me, an' they used to throw <u>rocks</u>//you know?
> *Louise:* ehheh heh!
> *Ken:* An' I was avoiding <u>rocks</u> . So I finally decided this isn't for me y'know, I took razor blades, took all my surf stickers off? So it looked just like a normal everyday Jeep, you know, an' I was drivin' around town, an' nobody throwin' rocks, or anything, it felt so good, y'know?

such and such," and having everybody try to live up to the best image of that thing, rather than, for example, attempting to simply change it, or ignore it, or do whatever else.

And those systems of control are not enforced by any government. There are no officials. Most members never know each other, but they live and die awaiting what will be in the next day's newspaper about what one of them did. I would bet that you could find that in the period between the assassination of the President and the discovery of who did it (not only 'who' – what name, but what he was) that every depressed group in the country sat in mortal fear of the fact that they did it. And they knew that for those that did do it, it would then be a fact of their lives. At best they can argue, by and large, "Well, there are good ones and bad ones among us."

It's been, I think, teenagers who have made a raft of attempts to break that kind of situation. From Beatnicks to whatever else, they've been engaged in setting up independent corporations which everybody is eventually forced to recognize on its own terms. In that regard, then, one can specifically see the tie to drug users, who are in effect saying, "Let them all retain the perceptual structure of reality; we'll make our own." Of course, in the case of kids, the problem of their attempted revolution is really fantastic, since they lose members at an incredible rate. Other sorts of revolutions might have more chance of success insofar as they can retain members.

In any event, what we want to see is that it's not simply the case that the fact that has long been known among anthropologists – that the Eskimos have 17 categories of snow whereas we only have one, means that they are much more interested in snow, or the fact that kids have 57 categories of cars means that they're much more interested in cars. Rather, those additions, and the focus on them, can be ways that more or less fundamental attacks are being launched against a culture which is stable by reference to everybody seeing the world for what it is, without regard to whether it's pleasant or not, whether they come out on top or not, and not seeing that they can do anything about it. And in that regard, the notion that it's merely the fun of driving fast that's involved, which may be part of the basis for setting up places where kids can drag safely, has provided for an enterprise which is doomed, simply by virtue of the fact that that sets up an administration of the phenomenon which is not theirs.

It's in that regard, then, that the important problems of social change, I would take it, anyway, would involve laying out such things as the sets of categories, how they're used, what's known about any member, etc., and beginning to play with shifts in the properties of a category, and shifts in the rules for use.

This lecture was given on March 25, 1966. Several months thereafter, Sacks clipped an article from the *New York Times* onto his copy of the transcript, with a small segment bracketed.

New York Times, Monday, August 8, 1966

Harlem Residents Seek to Dispel Whites' Fear of Area (continued from first page, second part)
"Ten years ago, a Negro didn't want any part of black," a young man said. "He wanted to be as much like the white man as he could be, but now he's realizing that he never will be some kind of white man. We're finding an identity that has eluded us for so many years – as black men."

A surprising number of people in Harlem now use the word black, in preference to Negro, in speaking of their race. Some are turning to African history and African dress to give themselves a more buoyant frame of reference than the melancholy history of black suppression in America.

Lecture 19
Appearance verbs

I'm going in part to deal with "and if I've got a tie and a sweater on and I look clean." I want first to consider the sorts of things that can be involved in "I look clean." Its interest lies, in part, in the fact that it's partially related to a class of apparent paradoxes that there has been a good deal of philosphical literature about. Also, it's interesting in relation to those verbs that name activities, which we talked of using Austin's term, 'performatives,' e.g., "I promise" and the like.

One of the things we noted, and that's important about the activity involved in using performatives, is the marked differences between the activities involved, given differences in the person (I, he, you) attached to the verb. "I promise" is one sort of thing, a way of doing promises. "He promises" and "you promise" are quite different things, and in part the warrant for saying "he promises" and "you promise" turns on the person being referred to having said something like "I promise." So the first person could be doing an activity, whereas a second and third are reports on it, which are warranted by there having been a first-person assertion (and that could have been other things than saying "I promise," which is not the only way to promise).

Now there are a class of verbs which we can call *'appearance verbs'* that work in a kind of reverse fashion from performatives. There is again a split between 'I' and 'you,' 'he,' 'she,' but it's a different sort of split. And perhaps not seeing the split, and not seeing the way uses of 'I' get warranted with the appearance verbs, is a basis for the sorts of apparent paradoxes that have been proposed; things like "I am dreaming." Another is "I talk in my sleep." Things that turn on sleep are very good ones and very usual ones for consideration of how is it that somebody can say that, and if they say that don't we have a paradox of sorts, where if you were dreaming you wouldn't be in a position to say "I am dreaming," etc.

So, recalling, to start out with, that a warrant for the use of 'you' or 'he' plus performative would be somebody's use of 'I' plus a performative, let's then consider these appearance verbs, where what I'm going to propose, in arguing that there's a kind of reversal situation going on, is that a warrant for the use of 'I' plus an appearance verb is the occurrence of somebody's use of 'you' or 'he' plus the appearance verb. Simplest case is, a warrant for saying "I talk in my sleep" is that somebody said to you, "You talk in your sleep." If one can move from 'I' plus appearance verb to get the derivation of it in a 'you' plus appearance verb, then of course there's no paradox.

The paradox turns on the fact that one has a normal class of 'I' plus

something, where it's warranted by the fact that I know it, or I'm the best authority, etc. And one doesn't separate out those which are normally or properly arrived at by somebody telling you it. And the grounds, of course, for not seeing that it has that derivation are, in part, certain sorts of paraphrases that are permissable. Now, the phenomenon of paraphrasing is a fantastically important one. It's learned very very early. In *Children Tell Stories* there's at least one use of it in an under-three-year-old's story. The kid says, "His mommy came home and told him to get out of the street." That statement is recognizable as not merely a quotation, but a paraphrased quotation. Mommy wouldn't say "to get out of the street." And it's of course a kind of interesting thing to see how kids would ever learn to make that sort of paraphrased quotation.

The phenomenon of quotation in general is an extremely tricky problem, especially in languages like English where there are no special ways of invariably marking that what we're doing is a quotation. In some languages there are grammatical markers that say 'a quotation is coming' or 'this is a quotation.' In English what you can do is say "He said" and the quote follows. But you don't have to, and there are considerable number of activities which turn on ambiguously using quotation marks. For one, it's a way of being ironic. For example, how would we decide that in the statement "You must be crazy or you wouldn't be here," he's asserting 'You must be crazy' or he's asserting 'You must be "crazy".' That problem has been one which has had rather vexing kinds of consequences in various historical disciplines. I'll deal with it when I consider some problems in the data, of deciding that we have a quotation. I only mention it now.

Now, given that 'I' can be used directly, it may be tricky to see that it's being used as a paraphrased quotation, i.e., that if one says "I talk in my sleep," what's being said is something like: "John said, 'You talk in your sleep'." "John said I talk in my sleep." "I talk in my sleep." Where, then, the first-person usage is a paraphrased quotation, and the warrant for the assertion in the first person is some assertion in second or third person. Of course this doesn't hold for all appearance verbs. But for those in which what one has is a usage which has the warrants I've laid out, there is clearly nothing paradoxical involved. And it is, of course, to be noted that Members perfectly well know this possibility, and at least on some occasions recognize a case of first-person usage to be a quotation. So, in the group therapy data, in another session one of the kids is saying "I'm crazy" and the therapist says, "You keep saying you're crazy. Have people been telling you that?" Another: A little girl comes home and says to her mother, "I'm beautiful." Her mother might well say, "Who told you that?"

We can then mark as the class of 'appearance verbs,' those for which it's appropriate upon the assertion in the first person for someone to ask "Who told you that," and where it's the case that a warranted use is that someone told you it. For any of those, then, there is in principle no paradoxical character to them. And the kinds of troubles that can occur are simply things like saying it without the proper warrant (i.e., without someone having told

you), or treating other people's assertions at face value when they're just trying to get things out of you or they're just trying to degrade you, or taking it that they think so though they haven't said so, etc.

We also can see that we get another pronoun relationship, this use of 'I' warranted by some use of 'you' or 'he' or 'she,' where again we have a kind of screwing up of the pairings that we started off with as obvious, i.e., I–We, you–you, he–they, etc. We now have 'I' derived from 'you' or 'he.'

And of course we have a kind of obverse to that classical philosophical problem, How do you know others' minds? which is, How do you know your own appearance? And the problem, How do you know your own appearance? turns on the fact that statements about your own apperance are warranted by virtue of somebody else's assertion. Where those assertions are problematic, not merely by virtue of their correctness or not, but by virtue of the set of affiliated activities that can be being done when somebody says, for example, "You look nice." And since such assertions are a basic way of learning about one's own appearance, a consequence of, e.g., 'taking all praise with a grain of salt' is that you get a rather special picture of yourself, since each of the decent characteristics can be heard as 'mere praise,' and the like.

Now in the case of "I look clean," 'clean' is not clearly one of those, since it can be learned, and there are devices for seeing and saying about yourself that you 'look clean,' on your own behalf, or by use of the mirror. The fact that some of the appearance verbs can be decided by oneself and some can't may well pose classification problems, and pose trouble for Members' knowing which ones they can decide and which ones they can't. And the metaphor of a mirror gets, of course, enormously troublesome. Psychiatrically you get a large variety of misunderstandings of proper classifications, which are symptoms. That is, from treating none of the appearance verbs as things you have rights to decide about yourself, to perhaps allowing nobody rights to decide for any of them, i.e., assimilating them all as things like 'clean.' From 'I can't trust myself at all' to 'I can't trust anybody else at all.'

Let's go back now for a bit. We have an enumeration of features: "I've got a tie and a sweater on and I look clean." What controls the enumeration? There are, of course, many places where we get enumeration of features. I take it that in this case it's unanalytically apparent that the enumeration is controlled by a picture being offered which is directed to presenting an appearance type, i.e., "If I look like a nice kid" – a 'nice kid' in contrast to, e.g., a 'hotrodder.'

The 'nice kid' category is not generically stable in that, that for which some persons – adults, cops – would see 'a nice kid,' may well provide for hotrodders that they're seeing a 'Soshe,' a 'square,' whatever else. And one other thing which we will see, which is related to the appearance of the 'nice kid' for the cops or adults in a deep way, is that he doesn't want to be seen only as 'a nice kid,' but he wants to permit being seen as 'a nice kid' by the cops, and an eligible dragster by kids. What he wants, in part, I take it, is to insist on the difference between the appearance of the 'nice kid' for cops, and the appearance that can be seen by a hotrodder, who should not be 'misled'

by his apperance. That ambiguously intended picture could be permitted by a legitimate dragger. It could be refused, by seeing him as in fact a nice kid and not just one who wants to appear so to 'others,' i.e., in fact 'a Soshe.' Or it can be seen as an ambivalence on his part. In this case, perhaps, that's what the term 'poor little rich kid' intends, i.e., somebody who wants to make it both ways, with adults and with the kids.

And you'll notice how in the story here, this little hypothetical anecdote, he gets it both ways. And he sets it up in a nice way. And that is that he's driving along and he doesn't make the move to do a drag, but somebody else does it. Where of course somebody else doing it involves somebody seeing him as acceptable, where that somebody else is, if not acceptable to an unquestionable hotrodder, at least more acceptable than him, i.e., the somebody else is wearing "a dirty grubby T-shirt." Where of course the offering of a signal – roaring up his pipes, which is the signal for a drag – involves the person who does it proposing himself as a candidate dragger for someone who he takes to be another – and not merely another candidate, but one who is entitled to accept the candidacy of the first. He might have said "I pull up to him, roar up my pipes and he accepts," to which they could then say "Yeah, you might do that, but nobody would accept." So it may well be not incidental that he sets it up with the other fellow making the offer. The other fellow would have had to decide that he was one who would be willing or competent.

Q: Are people aware, actually aware that they do this in conversation, such as having the other person offer the invitation by roaring up his pipes? Is it your opinion that he knows what he's doing or is it something that they have learned internally in conversation, and never become aware of it.

HS: Well, what I understand by 'knows' is that he does some such things as require my analysis to put that into him. See, you have a notion of 'a brain' and 'a person' and 'what they know.' And your issue is, 'Well, do they really know this or that? Am I going to get my knowledge corrected here? I know that's so, I know this is not so.' As I said when I began out, and as I intend throughout, the task is to find what it is that has to be built into somebody to make them someone who can do these things. That what they know, they know, quote, consciously or whatever else, is a problem. I don't at this point intend to solve it. I don't know how to solve it. I'm not looking at it. The question is, what kind of a machinery do I have to put in there? Now, a machinery that would say about something that, not only is it there, but it's there as a matter of their awareness, is another piece of apparatus, perhaps. But I have no idea. I don't have any idea of what it is that being conscious of something would affect. I suppose it's a kind of heritage from Socrates that one ought to be conscious of all these things, otherwise you can't really control them, or something like that – which supposes that if you are conscious of them you can control them.

Okay. So at least for our story's purpose, what he does is partially construct an appearance which is still satisfactory as an acceptable partner in doing drag racing. It's also an appearance that he takes it works for the cops, since the cop also observes the scene and doesn't arrest him. Now it's kind of nice to watch

how, given the fact that the whole thing and all of its parts are hypothetical, he sets it up in such a way as to show which of the hypothetical parts are criterial of the outcome. That is, each clause could be prefaced with 'if' just as legitimately as any other. Again, the data:

> *Ken* :   In that Bonneville of mine. I could take that thing out and if I've got a tie and a – a sweater on and I look clean? ninety nine percent of the time a guy could pull up to me in the same car, same color, same year the whole bit, roar up his pipes and he's in a dirty grubby tee shirt, and the guy'll pick the guy up in the dirty grubby tee shirt before uh he'll pick me up.

So, e.g., "I could take that thing out" could be rephrased as 'If I were to . . .' The only place where he does use 'if' is to mark this appearance sentence, "if I've got a tie and a – a sweater on and I look clean," where the appearance difference is parallel to the appearance of the other, and that's supposed to be a criterial matter, as to how one ever gets arrested. So the 'if' seems to signal that thing which is the hypothesis to be tested by whatever happens. And it's nicely set up as a hypothesis – all other things are constant, even though they're all equally hypothetical.

One thing you might note about this very long sentence is, apparently if you build sentences out of phrases and clauses you get a lot more positional freedom into them than when you don't use those sorts of things. What I mean to note is, e.g., here's this phrase, "99 percent of the time." It doesn't modify what follows it. It's not "99 percent of the time a guy could pull up to me . . . etc.," but, when we put the sentence back together again after having heard it, "if I look clean, a guy could come up to me in the same car . . . etc . . . and 99 percent of the time he'll get picked up." It's kind of interesting that we can really rearrange those matters; whereas within the clauses the words may not have that kind of positional freedom.

Now, what about 'look'? I suggested that what the enumeration is directed to do, is to offer the appearance of 'a nice kid,' where what's very important is that it's to be seen as the appearance of a nice kid who is not a nice kid. Not a nice kid, that is, for possible hotrodding, because a nice kid wouldn't do it. Now I have the feeling that the word 'look' there, which, to be sure, is legitimately usable with 'clean,' stands as an alternative to 'am.' In the case of clean, it's generally quite weak to say "I look clean," since if you look clean you most likely are clean, and the difference isn't very important. But in the case at hand, being it and looking like it are importantly different; "I am clean" could then have said of it, "Yeah, you're a nice kid," "You're a Soshe." Sticking in the 'look' there may well mark the fact that he's not really the thing that he's reporting the appearance of, but only looks like it.

Now there are certain questions which are kind of relevant to the theory he seems to be using here. For one, if it's the case that he's possibly doing a drag with somebody else, and a cop sees it, then for the cop, the decision that he *is* doing a drag is, in part, decided by whether he looks like somebody that

would do that. It's not the case, apparently, that if he does something that looks like it, if he's doing something that looks like what the other person is surely doing, then he's doing it. And it is, of course, regularly the case that when some activity is possibly going on, Members decide between whether it is or isn't going on by virtue of some determination as to whether its participants are 'the sort who do it.'

The use of such procedures are quite relevant, for example, to get statistics which show higher crime rates among Negroes, or among lower-class kids. If such a procedure is involved, then results are provided for by the way it is that one looks to find cases. That thing done by 'hotrodder' can be seen as 'dragging,' if it might or might not be. If he doesn't seem to be 'a hotrodder' then it might not be 'dragging.' In which case, you find hotrodders and nice kids having differential arrest rates. And it's not simply that that's available to us, it's apparently available to them.

Lecture 20

Character appears on cue; Good grounds for an action; An explanation is <u>the</u> explanation

I want to focus for awhile on ". . . roar up his pipes and the guy'll pick the guy up . . ." In the first instance, there's no problem about "the guy'll pick the guy up," as to who the guy who picks the guy up is, by virtue of 'picking somebody up' being category bound to 'cop,' permitting, then, a replacement of 'the guy' – which would be a general pro-term for 'male' or whatever – by 'the cop.'

When I was considering "The baby cried. The mommy picked it up," one of the things I was remarking there was that when a character who has some proper grounds for appearing and some proper thing to do, has its cue, then there's no need to account for how they happened to have come on the scene. Given "the baby cried," you don't have to get a characterization of where the mommy was, that she was anywhere around; the mommy does her job.[1] And we can notice that something akin to that *'character appears on cue'* phenomenon is present here. Where the cop was, how he came on the scene, is not indicated and not missing.

In certain circumstances there is a variant of the 'character appears on cue' rule, which is much stronger than the above. And that's what I want to focus on for a while. We can contrast what I want to develop with the phenomenon of "The baby cried. The mommy picked it up" by noticing that not only are there a large amount of other circumstances under which a mommy might pick her baby up besides the baby crying, which are also 'on cue,' but there are also plenty of circumstances where a mommy could pick her baby up without having any such cue from the baby. Mommies are free to pick their babies up, perhaps at will.

Now, for certain characters and certain activities of those characters, we have a circumstance where it's not merely that they can appear on cue, but they properly appear and do their activities *only* on cue. And that fact has a series of very large consequences. First of all, it permits a Member's description to be adequate which reports the occurrence of the character appearing, and his activity, without having to indicate what the cue was,

---

[1] See Spring 1966, lecture 2, p. 254. The foregoing part of this paragraph was taken from Fall 1965, Lecture 9, p. 183, as it is a bit richer than the consideration in the original lecture 20.

where it will be heard that there was a cue. So, in the case at hand it isn't that the guy roars up his pipes and that's why he gets arrested, but it is by virtue of roaring up their pipes being a signal to drag that, presumably, then, the drag would take place, that generating a violation – speeding – and the cop then picking him up for that.

In a way, that consequence is secondary to the strong character of this variant of the 'character appears on cue' rule. I'll quote a piece of data and we'll consider the strong inferences that are permitted if a character who properly appears only on cue and does his activities, is said to appear. This is a conversation between a psychiatrist and a person who's calling for help. It's a first conversation, perhaps the fifth interchange into it – no more than that. 'A' is the psychiatrist. 'B' has had a quarrel with his wife, and now he's reporting a scene that took place.

A: Yeah, then what happened?
B: Ok, in the meantime she ((she is the wife of B)) says don't ask the child nothing. Well, she stepped between me and the child and I got up to walk out the door. When she stepped between me and the child I went to move her out of the way. And then about that time, her sister had called the police. I don't know how she – what she–
A: Didn't you smack her one?
B: No.
A: You're not telling me the story, Mr B.
B: Well you see when you say smack you mean hit.
A: Yeah you shoved her, is that it?
B: Yeah I shoved her.

The power of the variant of the 'character appears on cue' rule for this special class of characters and their activities is that one who does not know the person they're talking to, beyond a very brief acquaintance, can tell that the other is lying. That is, when the other proposes both the occurrence of the character's appearing, and no cue. And that is to say, if the characters appear, then there *was* a proper cue. We can see, then, where this strong rule holds by seeing those places where a hearer can say that the reporter is lying.

Now that's quite an extraordinary kind of fact. After all, the teller of this story is the one that presumably knows what happened. And you don't have to know that he's a known liar. That he proposes such a character appeared and there was no cue, is good enough grounds for asserting to him that he lied. And that assertion can work, furthermore. That is to say, he can recognize that you have good grounds for knowing that he lied. He doesn't say, "How in the world would you know?"

It is important to see that, again, it's 'recognition' that we're dealing with – here, recognition of a lie. And it's perfectly conceivable that one could offer as the cue, something which wasn't true, either. So a successful lie under these circumstances would be to propose that some adequate cue, other than the real one in this case, occurred. Where, then, what we want to see is how it is

that the phenomenon of a lie becomes not idiosyncratic as to its recognition.

In part, the importance of the phenomenon can be perfectly obvious by just considering data like this. But it has provided a focus for rather more extended concern. The basic sorts of problems that seem to be focused around it can, at least roughly, be readily enough seen by considering one fundamental myth which turns on this phenomenon. And that is the story of Job.

Recalling the story of Job, one of his problems was essentially as follows: He's a good man, and he's well rewarded for being a good man. Unbeknownst to himself, he's being tested. The test consists, in part, of a destruction of the possible bases for his being a good man, i.e., the rewards – his wealth, his family, etc. And the occurrence of that destruction poses for Job a problem: Why did it occur? That it is a test is unavailable to him. He is quite convinced that it isn't a punishment; convinced because he doesn't figure that he's done anything to warrant that.

Now come his 'friends,' and they're engaged in a series of dialogues, which are, in part, directed to the relationship between morality and rewards in this world. They take it that what it is that would have warranted what had happened to him is that he did something punishable – where what has happened to him is properly to be conceived of as 'punishment', given that unless what has happened to him can be conceived of as 'punishment', it's inexplicable. It has, therefore, to have been what it might have been, so what he ought to do is confess. If he admits his guilt, they propose, he'll be in good shape.

We have, then, this phenomenon: If an explanation is available, then it's *that* explanation that is *the* explanation, and formulates what it is that's happened. Now, it's a very general phenomenon. Let me quote some further data which lays that aspect of things out quite clearly. It's a decision from a labor arbitration case. I choose it only because it's very explicit in its formulation.

> The story of the other discharged employees approaches the bizarre. Twelve of them testified before me. Each of them claims to be a completely innocent bystander, wholly at a loss to understand why he was picked up for discharge. None of them admits being part of the crowd in any of the demonstrations. None of them admits even the normal curiosity of an innocent bystander. Each claims that when the lights went out or the line stopped, he asked his foreman what to do, and upon being told to stay or go home as he pleased, but that his time stopped in any event, he left for home. One of the men, a lively young boxer, asserts that after seeing the crowd and the excitement, he calmly repaired to a warm spot and went to sleep. He did this, he asserts, on two of the three days, being absent on the third, and slept the peaceful sleep of the just, until the excitement completely quieted down. All, it seems, were veritable angels, above and beyond contagion by the excitement in the department.

Now there unquestionably were serious stoppages in Department 84 on November 5th, 6th, and 8th. There were vociferous and angry men milling around and demanding action. Who were the incensed men who did take part? Who were the angry men whom it was difficult to get back to work and who were so incensed that, as the Union claims, they turned against their own committeemen and even assaulted two of them. How indeed were these 14 chosen?

The Union advanced no explanation. There is no suggestion that these men were chosen by lot. And even such a method would normally be expected to catch some of the guilty. And there is no basis whatever in the evidence to suppose that the men were selected because of any personal animosity against them, with the slight possible exception of one man. Nor were the men generally regarded as troublemakers of whom the company would be glad to be rid. The company's explanation is simple, and without any contradiction other than the incredible stories related by the men themselves. The labor relations conciliator, with the help of his assistants, took the names or badge numbers of the most active men in the crowds that demonstrated in his office. This accounts for twelve of the fourteen. Under these circumstances I cannot give credence to the men's protestations of innocence.

Now the notion that it would be the business of a person proposed to be guilty, to explain how he came to be selected as the one proposed to be guilty, is crucial to these formulations – crucial to Job, crucial to the detection of a lie, and, of course, part of the enormous power of this variant of the 'character appears on cue' rule. We have, then, a circumstance where it is not merely the case that, lacking reference to the cue, some cue can be assumed to have been present, but the assertion of 'no cue' is an extremely difficult business to defend – and it's the business of the asserter to try to defend it if he can.

The phenomenon has further relevance for the data that we have. It is that sort of thing which provides for the occurrence of the question, "you must be crazy or you wouldn't be here." And it makes for a series of extremely difficult problems for any given person to handle, e.g., once you're in a mental hospital or a prison, though it may be the case that each Member takes it that they are there wrongly, they also take it that everybody else is there rightly.

Indeed, the very fact of a hearing is extremely troublesome to deal with. The notion that, for example, if possible mental patients were assured hearings beforehand, then that would remove a great deal of injustice, while it may be so that it would remove some injustice, has, if it's going to be argued, to take account of the fact that the mere presentation of them as possible ill persons, possible criminals, is a rather different thing than saying that anybody is possibly ill. 'Anybody' isn't there, and there must have been some reason that this one is there. They need, then, not simply provide that they're perfectly okay, but explain how they got selected – where that explanation is extremely tricky. Because, for one, it has to allow that such procedures as selected them will, by and large, in almost every other case,

select people properly. Were they to argue otherwise, i.e., that every case –
theirs being only an instance – is selected in God only knows what way, then
of course they prove their insanity.

And this is without anybody knowing by having studied how it is that in
fact, in any case, persons are selected. The matter of reforms in these areas is
by no means as simple as is sometimes suggested. Because, for one, a reform
that would involve 'a really true innocence until proven guilty' – in the sense
of no supposition of guilt by virtue of having been selected – would serve to
make activities like those of the police extremely difficult for them to do. And
that is even if such a notion could be maintained, and I don't see how it could,
anyway.

Again, what's involved, in part, is the circumstance under which various
persons other than those who did some observation, have the seer's maxims
available to 'see' what it is that must have been seen by those who did the
observations. Recall when I discussed "The baby cried. The mommy picked
it up," I simply asserted that producers of activities could use seer's and
hearer's maxims. That the seer's maxims are available to producers of actions,
and are crucial to them in producing their activities, can at least in part be
gotten at by locating those things which Members have available to them as
things that can be done subversively – under the very general usage of
'subversion' I offered. And in that regard, then, we get, for example, "If I've
got a tie and a sweater on and I look clean," where what's being proposed is:
'I could put on an appearance for which I can be assured as to how it is that
I will be seen by somebody unknown to me personally, via the fact that he's
a cop, and via the fact that he will use some seer's maxim to see who I am,
where I can use those facts to generate an appearance which has some more
or less guaranteed reading.'

Where ever, then, Members know how to do subversive activities, we can
take it that they have available to them some notion of what seer's maxims
will be used to observe them as problematic phenomena. Where, of course,
their subversive activities are directed to satisfying some constraints on how it
is that persons are to be seen. In that regard, then, subversion is simply a
consequence of seer's maxims, hearer's maxims and the like. If you want a
grandiose version of it, this is so in the sense that a poet is subversive according
to Plato, since he knows how to produce something that sounds real while not
being real. Which is to say, he knows how to produce something which will
be heard as correct though it isn't. Plato claims they're liars because he takes
it that they're not seen as lying. And successful lies satisfy constraints for
producing something that will be heard, according to one of those maxims,
as 'correct description.'

Let's move on a little bit now. The next line is "But not many people get
picked up in a Pontiac station wagon." Notice that there is transformation in
the name of the object being referred to. Earlier 'Bonneville,' now 'Pontiac
station wagon.' It's the same car. The notion that names are used only as
conventions seems unuseful here. Something like a notion that Russell offers
– that names are disguised descriptions – would seem to be much more

appropriate. That names are doing things, and that the use of a different name than another is criterial, seems clearly to be the case.

There's a beautiful example earlier in the session, exactly parallel to this one. The fellow that's talking about his 'Bonneville' is there talking about his Jeep. (In fact, the car that's his in the family, is a Jeep. The Bonneville is his mother's.) And he's saying that he just put a 'Thunderbird' engine in his Jeep, at which point somebody else says, "Why the hell do you want to put a Ford in a Jeep?" So, his 'Thunderbird' becomes a 'Ford,' as his 'Bonneville' becomes a 'Pontiac station wagon.'

Focussing on the statement "But not many people get picked up in a Pontiac station wagon," let me first note that if you took that sentence isolatedly, you could come up with a whole series of possible hearings that would never occur to you dealing with it as we are. For example, I take it it's perfectly obvious that we do not hear the statement as asserting that the Pontiac station wagon is not one of those circus cars with lots of people in it, i.e., that when a Pontiac station wagon gets picked up it's relatively empty, though syntactically that's a perfectly decent reading of "not many people get picked up in a Pontiac station wagon." And if you're dealing with possible syntactic ambiguities, you would have to come to terms with how it is that that would just not occur to you. And the notion of 'the sentence' as subjected to syntactical consideration as a sentence isolated, and that giving you important results, has to be considered when you find how strange, indeed, such a reading would be – though of course there might be some use of that sentence which would have such an intention.

It's clear, then, that we have to deal with the sentence in its position in this argument, in trying to see what it is that's being done with it. Where one of the facts is that what's being done with it is perfectly clear to the hearer of it, who says right off, "Now well I agree it looks like a Daddy – it looks like a damn Mommy's car."

Now there's a point to the statement somewhere, and the question of how to find how that statement does that point is a very large issue. I can't deal with it. But there are some things, anyway, that might be said.

It stands in nice juxtaposition to the earlier pair of statements, where the fact that you're bound to get picked up in a hotrod is treated as posing the challenge. Here, "But not many people get picked up" seems to involve, in part, that if you don't get picked up, then that's not countable as a success. The conditions under which not getting picked up is countable as a success, turn on those conditions which provide that you've got a challenge.

Once we get to that, what seems, then, to be involved is that we have here – as we have throughout – a piece of an argument serving quite adequately to suggest clearly what the argument is. In this case, for one, what's crucial is not simply that not many people get picked up in a Pontiac station wagon, but the relativity of that fact to the drivers of Pontiac station wagons. That is, plenty of people drive Pontiac station wagons; of them, few people get picked up. Where, if few people drove Pontiac station wagons and few got picked up, you could still have a perfectly good challenge, insofar as Pontiac station

wagons were treated as relevant to whether you get picked up. And that is part of the apparent argument, as seen by the respondent to it. Pontiac station wagon is at least a case of a type: Daddy's car, Mommy's car. Where users of that type are treated as having a fate in common, such that certain accounts and only certain accounts are relevant in explicating certain problems. For example, why you didn't get picked up is to be handled via the fact that you were driving one of those cars, and other possible explanations are ruled out.

And again, that argument that the fate turns on the type of car is one which involves the fact that seer's maxims are available even for this hypothetical case. Some such thing as: 'A policeman sees a Daddy's car or Mommy's car, and knowing what he knows about such cars and how they're driven, and knowing that they're a legitimate type for him to use to decide what they might be doing, ignores them.' So that a person in one of them who violates a law has a much lesser chance of getting picked up than a person in some car known as a type driven by systematically violative drivers.

This knowledge being available means that when we deal with arrest records of teenagers, we're not dealing with such things as might be handled via Driver's Education and things like that. They know their fate before it happens, and indeed they're proposing to reject, not merely the chance not to drive fast, but the chance to drive fast under circumstances in which they're not so observable. That is to say, the chance of getting arrested is apparently some strong consideration in doing whatever they do, in the ways that they do it.

Lecture 21

Misidentification; Membership categories; Utterance pairs; Paradoxes

In this lecture I'll be concerned primarily with two technical problems. The first is as follows. Is it the case that for some places, the sequence in which some rules are applied to give us an analysis is important? And what, then, are the proper sequences for applying the rules to give us an activity? And the second concerns the orderliness of relationships between more or less complex activities. Can we find order in their relationship and can we provide for that order?

By 'complex activities' I mean things like doing discussing, which doesn't take place in an utterance but involves at least several. What I'll be concerned with is that in the given segment that we've been considering, there are two complex activities which are named as taking place, by the participants. 'Discussing' is one, and the second is 'tearing down.' One question we want to ask is whether such activities as those occur recurrently in the order they occur in here, and is there some way of showing why they occur in that order, and how one leads to the other? We'll get to that problem in a while. I'll deal with other things as well, besides these two problems.

We can begin to consider the problem of sequences in applying rules by looking first at this line, "Yes Mommy. Thank you." Recall that I've mentioned the problem of what could be called '*misidentification*;' that is to say, that a term like 'Mommy' is used to address and refer to somebody who isn't the mommy of the person so referred to. And when I've mentioned that problem I've said that it has some considerable theoretical importance. One importance it has is something like this: If we took it that the way to determine who it is that's being referred to by some category is to be decided by a '*correspondence criteria*,' i.e., by looking to see who it is that's properly a member of that category, then the problem of misidentification would be extremely troublesome. We might end up simply with saying that either the person who could be correctly referred to by that category is being talked to or of, or, if there seems to be nobody who could be so referred to, then an error is being made. And we might not have a good way of dealing with *intentional misidentification*, which is a way of doing some particular activity, e.g., 'insulting.'

This is a condensation of lectures 21 and 22.

If a correspondence criteria has this sort of inadequacy, that it cannot deal with intentional misidentifications, then we have another way – besides the way I formulated in 'The Search for Help' paper – of coming to see the systematic, general, in-principle inadequacy of the social scientists' use of correspondence criteria for deciding who it is that could be being talked of by the assignment of some category that could be correspondence-correct. That is, another way besides the way I posed there, which turned on two or more devices being available to categorize anyone who might be being talked of.

When we consider the correspondence criteria, and pose for ourselves the problem of assigning a sequence to a set of rules for reproducing the activities being done, we might use the correspondence criteria as one possible first-order rule for dealing with the use of membership categories, that would run something like the following: 'If some person uses a membership category, then look to see whether there is somebody present, properly characterized by that category. If so, treat them as the person categorized.' And there are clearly places in which such a formulation would work. Suppose a child is in a room with his parents and says, "Get me a drink of water, Mommy." Then one could take the term 'Mommy,' see who it is among the other persons present that could be categorized by that, and arrive at one. And there would be a variety of ways of arriving at that one. Then, of course, treat that one as the one being talked to. Such a rule wouldn't work to give us *a* person being categorized in this case, and it wouldn't, I take it, deal with terms which are different from 'Mommy,' like 'stupid,' which could be used to refer to and address somebody in some utterance.

Now the question is, does there seem to be some way that Members go about locating who it is that's being addressed by some term? As I pointed out earlier, and this is of course perfectly apparent – though that it's apparent does not mean it's unimportant – who it is that's being addressed by "Yes, Mommy" is understood by the Members, and they then may well seem to have some way, apart from correspondence correctness, to determine that someone is being referred to by a membership category. How, then, do they do it?

I think that what's relevant for a solution to the problem is that the rules of conversational sequences are the first rules to be used. Then what one wants to see is whether there are some rules of conversational sequencing which, before considering the membership that was used, will tell you who it is that's being addressed by that term. Then the term that was used can be considered as to what activity it might be doing, given that you know who it is that's being talked to or of, with it.

So what we need, then, are the variety of appropriate rules of conversation sequencing. And these can be more or less abstract, or they can be particular to the sorts of things being done. Where their abstractness can just provide for a testing of the rules.

Now, we're at this point where we have:

Roger :   Ken, face it. You're a poor little rich kid.
Ken :   Yes Mommy. Thank you.

And for "Ken, face it..." we can, for example, take it that one rule operating is: A person addressed by some utterance is given the occasion to talk next. Now that's very loose and general, and doesn't tell us what in particular is being done by the thing they're addressed with, or what they might be doing next, or, for that matter, whom they might talk to, if there's anybody in particular that they might talk to. But it is recurrently the case that that is done, i.e., giving a person the floor by addressing them – particularly by addressing them with their name. (You can use it to get the floor yourself, in a variant of that situation I considered for kids, i.e., "You know what, Daddy?" gives the floor to Daddy who gives it back. So in this particular two-hour session we regularly find things like: Somebody says, "Roger," Roger says "Yeah," and the other talks.)

As it happens in conversations in American English, it's regularly the case that the use of a name in address, signals a change in the topic of conversation. I don't know why that's so, but empirically it looks to me like that's done very regularly, and it seems to do that. There isn't any grammatical way to signal a change of topic in English, though there is in other languages. Some American Indians apparently have a grammatical means of signalling that you're going to make a topic change. In this case I take it that we could find that a topic change is being introduced with this utterance, from an 'automobile discussion' to the beginning of 'tearing down,' where Ken is the topic.

So: Ken is addressed, Ken can speak. Secondly, at least one of the things that seems to be done with that line "you're a poor little rich kid" is to offer an insult. Insults come in pairs. To a first, a second may be returned. We can get at that in a fairly decent way, in that, for one, even if we're uncertain as to the fact that the first was an 'insult,' there are a collection of 'second insults,' i.e., locatable returns to insults. And misidentification of kinship terms are, very regularly, just such things. That's a very very ancient convention. Here's a citation. Eric Partridge, in *The Shaggy Dog Story* (1954), page 15, reports as an ancient Greek story (and the same thing has been reported very widely):

> A pert youth, meeting an old woman driving a herd called, "Good morning, mother of asses." Return: "Good morning, my son."

There are, of course, fairly decent formal reasons for using kinship terms in this fashion. If it is that something derogatory is being proposed about a person, then one way of generalizing it, or providing for its source, is to use kinship terms.

Now if we have any first utterance – an insult or something else – that provides for a proper second, and provides also for whom that second should be addressed to, then what we can do is see, first, whether it looks like the

rules are going to be used by virtue of the fact that the person located by the first speaks. If they do, we can look to see whether or not they include a membership term, and if they do, we can take it that they're using it by virtue of the set of rules that provide for their second speech, and to whom it's addressed.

That sort of thing can gives us who is addressed by the terms in a variety of second utterances to the first speaker rules: Questions and answers. Commands and returns. (Commands and returns very frequently have misidentifications in them, e.g., "Get me a drink of water." "Yes, Boss.") And then we're in a position to consider what it is that the particular term is doing – if we haven't got, in the first instance, some good idea of what it is doing.

In short, what you want to do is to treat the rules of conversation sequencing as the first things to apply, before such things as 'consistency' and all the rest are applied. And we can take it that before the second occurs, persons could say who will talk, and who they will talk to. And that, again, gives us a way of seeing how it is that the membership term is not doing that work.

Of course in this case there are a series of ways that the second utterance is tied to the first. That is, both 'yes' and 'thank you' would lead us to suppose it's a tied utterance, even if we simply had the utterance itself and didn't know, for example, that an 'insult' had preceded, and the like. But of course lacking the insult, it could perfectly well be, not a 'second insult,' but, for example, an 'appreciation:' "Look what I brought you home." "Thank you." The character of the whole item, then, what activity it's doing, who is being referred to, can be found, in part, via what the first was, since it can be a second to a whole series of things. And of course the category name used, 'Mommy,' is to be found via both who it's talking back to, and the kind of activity it's a return to, i.e., its character as a 'second insult.'

I said that a 'first insult' can be followed by a 'second.' And now that thing seems to be used regularly in a chained fashion, the second treated as a first for a next, and so on, so that insults can be strung together. The game, Tearing Down, is that sort of game, and there's a literature on it. One place you'll find a discussion, but the name Tearing Down is not used there – it's an earlier study and it doesn't deal with America – is *The Lore and Language of School Children* by Peter and Iona Opie. There's an article entitled 'Ritualized verbal insults in white high school culture,' *Journal of American Folklore*, 78, page 337–344, and they cite an early literature on this.

What I want to do now is move through the various parts of this 'tearing down' procedure. The next line is "Face the music."

> *Roger* : Ken, face it. You're a poor little rich kid.
> *Ken* :   Yes Mommy. // Thank you.
> *Roger* : Face the music.

And that's not a new insult, and as such, it seems that the fellow who delivered the first is withdrawing, i.e., is not going to play a game – or to

continue it, anyway. But someone else picks it up and offers him a teammate in that game, against the other fellow. And he accepts the offer and begins again.

Roger: Ken, face it. You're a poor little rich kid.
Ken: Yes Mommy. // Thank you.
Roger: Face the music.
Al: Okay. Now you've got that er outta yer system. Now you're a poor little rich kid we've told you that.
Roger: And we also decided you're a chicken shit.

The offer of a teammate is done in a rather nice way with "Now you're a poor little rich kid, we've told you that," where "we've told you that" is affiliating himself to that thing which the prior fellow said. And he's thereby, I take it, proposing himself as an ally. The prior fellow accepts that, in what could be seen to be a collaborated utterance, "And we also decided you're a chicken shit." Now, earlier in the session he had said, independently, "You're a chicken shit." Saying it again here, in a collaborated utterance, what he's doing in part is saying, 'You, having latched onto the last thing I said, and having announced it for "us," you might as well latch onto something I earlier said. It's now also for "us".' That is, since they're making a team, they might as well add up their resources.

We get a tremendously interesting line in return: "I decided that years ago the hell with you." The first part of it, "I decided that years ago" could look like an 'agreement' and yet, at least for me, it doesn't come off that way. And furthermore, the second part, "the hell with you," seems to be not consistent with the first part as an 'agreement' (if you needed any reason to doubt that "I decided that years ago" was an 'agreement'). Of course the fact that it's not consistent with an 'agreement' isn't necessarily an unequivocal matter, since they may well have a series of inconsistent statements.

In any event, in dealing with "I decided that years ago the hell with you," which seems to be some kind of denial and not some kind of agreement, what I wanted to see was how could it be a denial, and what kind of critique might it be of the former remark? So the question is, can we establish that it *is* some kind of critique, denial, or whatever? And how does that work?

The way I proceeded was to consider what kind of activity would it be to decide that oneself was a chicken shit. We might say that it would be courageous, i.e., it would take an act of courage to decide that you were a coward. It's facing a rather unpleasant fact, and decisions of that sort about oneself are treatable as acts of courage.

Q: Isn't it an assumption that such a decision is courageous? Such a decision may not necessarily be an act of courage.

HS: I've been interested to explore what could be called the grammar or the technique that persons use to arrive at and do the various things they do. It has never been my aim to give medals to people for doing what they do. And when I say that it's an act of courage to arrive at the statement that

you're a coward, I'm not saying 'This fellow's done something courageous.'
Rather, is it the case that it could be said of somebody who says that they're
a coward, that they've done something courageous? If so, that's all the point
I need. And I take it that you think that that's so, in that you're saying that
it's "not necessarily" the case that that's so.

That's all that I'm trying to propose. What can be said to be the
constructed procedures for arriving at an activity? What activity is involved in
arriving at another activity? In this case we have, deciding that you're
something that's a negative fact about yourself. And one thing about that is,
it can be something courageous. Certainly I have no idea whether this fellow
is a hero, or whether he in fact decided that years ago, or anything else of that
sort. For anybody who was to do such an activity, what makes it recognizable
as whatever it happens to be? That's what we're trying to deal with. And as
I have emphasized throughout, and I shall emphasize again, what I'm dealing
with are *possibilities*. And I'm trying to lay out the relationship between
possibilities. For some possibilities, if we get *a* possibility that we can
establish, that's fine. If one is claiming that it could be another thing, first one
wants to show how it's another possibility. That takes a task of analysis. Then
you may want to resolve the two possibilities, or the ten, or leave them open,
as you please.

Again, that he has done something courageous is something I have no idea
about, and I'm not making any statements about. If it's the case that arriving
at such a conclusion as that you are a coward can be courageous, then we get
a rather interesting situation. And that is, that to say "I decided that years
ago" is to say something *paradoxical*. If it's true that you decided you're a
coward, then you're not a coward.

Paradoxes of that sort – for which another term is 'antinomies' – could be
called 'generative paradoxes' in the sense that the procedure whereby
something is arrived at involves, for it to be arrived at, some other fact to be
present which, if it's true, makes it false. Now the question is, do people in
fact play with paradoxes like that? Is there any evidence for supposing that
they do such a sneaky thing as that? And what gain is there in a case like this,
to make such a paradoxical statement?

The phenomenon of paradoxes has been a matter of very large interest in
such areas as philosophy and logic. The classical paradox is the famous
statement attributed to an ancient Cretan who said, "All Cretans are liars."
If that is true, then it's false, etc. And that paradox has had tremendous
influence in the history of philosophy and the history of logic. For one, it's
been used within logic to formulate a basis for saying that no natural language
can be said to be consistent, and, relatedly, that the notion of truth cannot be
applied to a natural language, and a variety of other consequences which have
had as their import that logicians study the languages that logicians construct,
and propose that you can't logically study natural language.

These inconsistencies which are developable within natural langauges have,
then, had very large import for logic. And as a consequence of their import
for logic, they have had an import for philosophy. There, the problem has

been posed: Can you do philosophy in a natural language if it's the case that the natural language harbors inconsistencies? In such a language you can't, perhaps, then, decide that what you're saying is consistent or true, and therefore philosophy has to be done via the languages that the logicians construct and study. In chapter 1 of any logic book, you can find considerations of antinomies for logicians (for a fairly comprehensive review of the literature on them, see the appendix to chapter 1 of *Foundations of Mathematical Logic* by Haskell Curry. So the question of their import for philosophy has been much argued about. Now, in an article called 'Is everyday language inconsistent?,' *Mind* (1954)), A. Stroll is concerned to argue that while it's theoretically possible to build antinomies in English, and probably in any other natural language, Members never do it, it's a resource that's unexplored, and it's therefore not to bother philosophers, who can do philosophy, meaningfully, in natural languages.

Let me say that you can take it as a good bet that persons will do anything a language permits. What we want to do is to see that, in fact, such antinomies are used, and that they have a perfectly nice basis for being used. First, however, let me give a quotation which depends for its sense on the fact that it's not heard as a paradox, and the work that's done in hearing it involves avoiding the possibility of paradox. This is from *A Black Byzantium* by S.F. Nadel, page 71, note 3.

He's talking about a tribe, the Nupe. The tribe was conquered some while back by another bunch of people called the Falani. Now the Falani have been absorbed by the Nupe, but they remain the ruling group in that place. So anybody who is a Falani is also a Nupe, and of course some Nupes are Falanis.

> The following is a significant anecdote. The Etsu Nupe (Etsu is King) once confided to me his grievance against a certain rather unruly relative of his, whom he believed to have intrigued against him. He added, "All Nupe are bad people, you know."

Where the sense of that depends on the fact that he's treating himself as a Falani for that remark, and not saying it about himself, but about his relative and others. Nadel goes on:

> The said relative, himself of course as much Falani as the Etsu, retaliated by informing that "All Falani are liars."

For that remark, treating the other as a Falani, not himself.

The sense of that one depends on the avoidance of the possibility of its paradoxical character, where that's done via the manipulations of the membership categories. Now I want to quote a clear use of the antinomy, and perhaps we can get at what's being done with the use of the antinomy in general, and what's being done in our case. This is from the *New York Times*, Sunday, December 5, 1965. It's an article on Marc Chagall.

Between 1923 and 1939 many less perceptive critics and art lovers, even in Paris, tended to confuse Chagall and Mané-Katz because of a superficial similarity in their choice of Russian Jewish subjects. One day in the early thirties, one of the Left Bank's most notorious gossips asked Mané-Katz what he thought of Chagall's work. The answer came without hesitation, "He is a great artist." The same busybody then hastened to ask Chagall what he thought of Mané-Katz. "He's a very bad painter," Chagall replied. His opinion was promptly relayed to Mané-Katz who shrugged his shoulders and (perhaps unconsciously paraphrasing an ancient Cretan sophist's example of paradoxical ambiguity) wittily disposed of the whole matter: "Well, all painters are liars."

What's being done with the antimony there, and it's a clear case, is that in undercutting his own earlier statement he undercuts the other's, as well. It's a very nice way, then, of presenting a remark which, if true, is false, and thereby getting at the falsity of another remark, which would fall with it. It does it without being a direct controversion of it; that is, he doesn't argue by saying, "No, I'm a very good painter," but by producing a remark which is false if true, so the falsity of the other is provided.

Then the issue is, not 'why would a sentence be made, of itself, paradoxical?' but, what is it that can otherwise be done with a paradoxical statement, i.e., it can perhaps undercut another troublesome remark. It's perfectly conceivable, I suppose, that the original "All Cretans are liars" had a similar usage, though we don't have its context.

So I take it that with "I decided that years ago" we have a quite elegant return to the charge of cowardice. Of course it carries other possibilities with it – for example, 'It took me courage to decide that I was a coward. What does it take *you* to decide that I'm a coward? Then, the end to it, "the hell with you," is perfectly coherent with the rest, being, possibly, an exemplification of a piece of courage.

I want now to move to the second problem I posed, which was: How do we provide for the transition between a 'discussion' and a 'tearing down'? And how do we provide for the order we find in their relationship, i.e., that discussing comes first and tearing down second?

First of all, I take it that the fact that those two activities occur in a given order – discussing first, tearing down second, is non-trivial, that it is a recurrent order, and indeed, that given the first, the second is often expectable. So it's not simply that when the two occur they occur in that order, but that if the first occurs, Members take it that the second can expectably occur. I take it that that is clear. And let me point to certain problems which persons regularly announce to each other. They can say, for example, "Why can't we ever have a peaceful discussion anymore? Whenever we get into a discussion it ends up in name-calling." Furthermore, when some topic gets started, persons will regularly say, "Let's not start on that, we're liable to get into a fight if we continue."

Now what we can be doing in part is examining what lies at the basis for correctness, if we can see as correct those assertions that they make. But apart from that, what we want to watch for is the kind of components that complex activities have, and the ways that sets of complex activities can be put together. Is that also orderly? If so, how? And is it also perhaps the case that these complex activities are built by putting together in one or another fashion, standardized pieces which can be used to put together other activities, complex or simple? If so, an image I sometimes use, of people assembling activities out of standardized parts, of a culture as a warehouse, can get a fairly apparent sense to it. And that is the technical interest we have in the problem.

We have in the first instance, this phenomenon of the 'discussion,' which can have a 'topic' – in this case, an 'automobile discussion' – and a variety of positions taken on that topic, where as one good criterion for seeing the thing as having been brought to a close, there is this business of arriving at 'an agreement.' There are a bunch of ways that an agreement can get arrived at or not, but those are not what I'm concerned with now. I mention an 'agreement' because I want to differentiate it from the kind of criterion that's used in 'tearing down.' And also, to get at, in part, what provides for a transition between discussion and tearing down.

Now we've got a set of positions offered. We could then have, as one direction that the conversation goes, various attempts to get changes of position, e.g., 'You change yours, I'll change mine,' or 'I'll try to change yours while retaining mine,' etc. But there's one possibility that is regularly used, and that involves, for one, formulation by somebody of an *explanation* of some other person's position. And it may be a certain sort of explanation. We've noted before that many activities are known to be category-bound, and that positions can be category-bound phenomena. If that is the case, then one sense of an explanation of a position is to see that the position is category-bound, and to what category it's bound. Now that kind of an explanation is a fairly special one. It regularly constitutes an undercutting of the position that was taken. That is to say, if you can find that category to which the position is category-bound, you can use it as an explanation of the position, which provides for the undercutting of the position.

And that possibility has had some rather major uses. One very prominent sociology consists of the systematic exploration of that possibility for undercutting all sociologies, including itself, and that is the sociology of Karl Mannheim. What he was engaged in doing was to propose that all sociologies (first he started with conservative sociology) were generated from some position within the social structure, which explains how they came to say what they say, and partially undercuts the objectivity of such positions. It's another case where some particular resource that Members routinely use, has been turned into a more or less major scientific weapon. And it's a weapon that becomes especially powerful when it's the case that those positions that are used as accounts of what it is that was said, are constructed and controlled by the sociologists that use them. That is, then, a much weaker check on whatever kind of correctness there is for category-boundedness than there is

when somebody says, "You say what you said because you're a poor little rich kid," where anybody might well know that 'poor little rich kids' say such things.

So in this case, asserting an explanation of some position via some membership category, which accounts for that position having been taken is, in part, part of the 'discussion.' It works in the discussion by perhaps removing one of the positions from contention, and perhaps then, leaving the other victor – if there's only an other. However, it sets up its own consequences, and that's what I want to deal with, in part.

For one, there's a considerable gain when an explanation via categorization has been asserted, such as "Ken face it, you're a poor little rich kid," and that is, that the criterion for success has changed very considerably. It can remain 'agreement,' but now on the question of whether he's that sort of thing that's been proposed. And that's not for him to decide, but a matter of agreement among the others. What we get, then, is at least a partial narrowing of the population in which agreement is to operate as a criterion of success. And in this case, of course, we get the agreement by the third party.

For a great many positions taken in conversation, and especially – by definition – those taken on 'controversial' topics – where 'controversial' topics are defined in the first instance as those on which any given set of people can be known to differ, and to differ by virtue of those categories they belong to – it may well be the case that it's an intrinsic possibility that at any point those categories can be invoked, and, once invoked, the rest can be invoked.

Lecture 22

There is no lecture 22 in this edition; it has been combined with lecture 21.

Lecture 23
Agreement; What can be done with language?

I've been using, with regard to both the phenomena of 'a discussion' and 'tearing down,' the term *'agreement,'* and I want to say a bit about it. It is used within the conversation itself; one of the fellows says at one point, "Now well I agree." And there are other places where at least it might seem to be a way that an assertion could be made, though it's not. So, for example, after the statement "Ken, face it. You're a poor little rich kid," we get "Now you're a poor little rich kid we've told you that," where "we've told you that" is kind of different, perhaps, than 'I agree with what was previously said.' As I said earlier, "we've told you that" involves, it seems, formulating what was previously said as having been said representatively, and therefore incidentally said by the other guy, but said on behalf of us – even, perhaps, whether he knew it or not. So that's one sort of alternation to doing agreeing. And later on in the conversation, at the end of the sequence of questions applied to the entrant, there's a bit of a discussion about whether he's "just agreeing," or presumably whether what he's saying is what he knows to be the case.

Now the activity of 'agreeing' is one to which some attention has been given – much more than I can, and I only want to open it up as something one might attend. One way that we get to open up such a phenomenon as an activity, is to try to get some idea of it as something invented or discovered, i.e., a resource which may not always have been present. Here is a short citation which kind of suggests that about 'agreement.' It's by the classicist Gilbert Murray, in a book of essays entitled *Greek Studies* (1946), page 175. He says:

> The early Greeks had, so to speak, discovered the logos. They had discovered that often, instead of fighting you could say something, and the thing said would make both sides agree. If people were bewildered or puzzled they could say something and the thing said would make them understand.

Presumably what he's trying to get at there is, for one, that the resources of a language – what it is that could be done with it – are things that get discovered at some point, and when they are discovered, they may be tremendous news. Where the activities that could be done with a language may well be such kinds of things. In that regard, then, one might reconsider an extremely famous formulation. It's by Edward Sapir, in his book called *Language*. This is from page 14.

We're not, in ordinary life, so much concerned with concepts as such, as with concrete particularities and specific relations. When I say, for instance, "I had a good breakfast this morning," it is clear that I am not in the throes of laborious thought; that what I have to transmit is hardly more than a pleasurable memory symbolically rendered in the grooves of habitual expression. Each element in the sentence defines a separate concept or conceptual relation or both combined, but the sentence as a whole has no conceptual significance whatever.

It is somewhat as though a generator capable of generating enough power to run an elevator were operated almost exclusively to feed an electric doorbell. The parallel is more suggestive than it at first sight appears. Language may be looked upon as an instrument capable of running a gamut of psychic uses.

Consider, in the first instance what, for him, is obvious; and that is, that what it is that could be said to be being done by use of language specifically is transparently obvious, stateable by stating the sentence itself ("I had a good breakfast this morning"), and then to be seen to be using very little of what language really could do. What the import might be for researchers, of a statement like Sapir's – small or large – might turn on whether, for example, our understanding of the statement is invoked in the same way he constructed it, or whether it was taken to pose some more or less significant problems.

I'm going to quote another passage that refers to this earlier one, and which does draw some consequences from it. This is from a paper, 'The semantic structure of language' by Uriel Weinreich, in Joseph Greenberg (ed.), *Universals of Language*, pages 117–118.

In a remarkable passage, Sapir likens language to a dynamo capable of powering an elevator but ordinarily operating to feed an electric doorbell. Language is used more often than not in ways that do not draw upon its full semantic capacity. In its 'phatic' functions, when speech is used merely to signify the presence of a sympathetic inter-locutor, it easily becomes 'desemanticized' to a formidable extent. In its various ceremonial functions, language may come to be desemanticized by still another mechanism . . .

The more pressing task for linguistics, it seems to me, is to explain the elevator, not the doorbell; avoiding samples of excessively casual or ceremonial speech, to examine language under conditions of its full-fledged utilization.

Now the last thing that I intend to be doing is legislating for linguistics. But the idea is held that we know, right off, where language is deep and interesting; that we can know that without an analysis of what it is that it might be doing. One wants to see, for one, that the set of ways a statement like "I had a good breakfast this morning" can be talked about; for example, 'phatic,' 'conceptually rich,' 'conceptually poor,' 'non-conceptual,' etc. are all

given as a set of alternatives, again without it, or anything else being studied very much. But a program is laid out. And among the important things about that program are what's not to be studied. And what's not to be studied is proposed, not by virtue of, for example, that today we couldn't study that, but by virtue of presumed results. Those are really quite extraordinary arguments. And if they don't proceed quite strictly from a notion that we can or must know what the aims of a discipline are before we begin, then a good deal of that is involved in such formulations.

Such questions as what language can do, what people can do with language, what the results of an analysis of "I had a good breakfast this morning" would involve, what kind of program it poses for a field, all these things remain absolutely open.

Indeed, *more* remains open, since we might ask, for example, by what right (assuming Sapir to have heard that sentence) could he have proceeded to pose *it* as a singular problem, i.e., to have isolated it from whatever it happened to occur within, and to suppose that it could be analyzed, transparently, in that fashion. For one, at the root of several fields concerned with language and with much other social behavior, is the idea that you can pick out an item, however you want to, and consider that the isolated item contains the properties that it would, must, ought to have, when it otherwise occurs. But one would, for example, imagine that the sentence "I had a good breakfast this morning" was not the first and only sentence uttered in the conversation. Maybe it was the answer to a question. Maybe it came well into a conversation. Is it the case that anything occurring anywhere in any conversation can be isolated without regard to the fact that it occurred in such a place? Is it the case that a language is built to provide that that should take place, and to allow for stability of things like meaning, etc.? What's being done with this thing?

I've gone through this discussion, for one, to notice that it is perhaps not incidental that people have not devoted their life to studying sentences like "The baby cried" or "Hi, how are you." There may be more or less defensible reasons for not studying such sentences. Not doing that, however, has real consequences.

I started out by noticing that what it is that can be done with language, i.e., the resources of a language, are things that get discovered at some point. Such ideas as that we already know where language is deep and interesting, and what it is that it might be doing, might lead us not to see that some things are properly – at least for heuristic purposes – to be seen as inventions at some time. Now in the case of 'agreement,' certain aspects of its use can be said to have been great discoveries. So, for example, one of the things that's said in the history of religion is that one of the great contributions of the Jews to the history of Western religions is the fact that they were the first to formulate their relationship to God as a matter of 'agreement,' where that involved an enormous shift in conceptions of religion.

That matter posed a long bit of historical research into the question of where did they come up with the idea of a covenant binding them and God? To which, about ten years ago, a proposed solution was offered. A fellow

named Mendenhall, a student of the history of religion at Michigan, was working in the Hittite archives. The Hittites were a people who controlled the ancient Near East some 3,000 years ago. And they had massive archives which were discovered toward the end of the 19th century, which people have been working in ever since. And there, Mendenhall found among some of the archives, what turned out to be the Hittite vasselage agreements. That is to say, those agreements which the Hittites made with the various small tribes that they controlled. And what he found was that essentially nine of the Ten Commandments could be found as parts of the normal Hittite vasselage agreements, which ran to the effect that 'We are your only ruler,' etc., just as do the Ten Commandments. That is, of course, only proposing that that's where it came from; how it was transformed is another issue. And more recently it's been criticized somewhat. But the possibility of the political derivation of such a phenomenon is of some interest.

Now, the recognition that one can do the activity 'agreeing' is treated as something that the ancient Greeks discovered, though lots of other peoples would have discovered it as well, presumably independently. And of course the question of independent discovery of this or that resource is a nice one. It's said, for example, that science as we know it is something that *only* the Greeks discovered independently, and everybody else learned it from them. And what activities are discovered by every culture independently, then, gives us some idea of more or less intrinsic properties of, say, a language.

Agreement can be of great interest by virtue of the things that seem to be involved in it. For one, the notion of the comparability of statements – and that, of course, is fundamental to the development of logic, mathematics, and the rest. Now it's not simply the notion of the comparability of sentences, because presumably it was discovered that even sentences which were not exactly alike were 'the same.' That's the sense of making a statement in a sentence. That this comparability could be used for purposes of deciding 'sameness' across persons, across time, without respect, perhaps to some extent, of context, that would be quite an achievement. And it would be a legislated achievement, where presumably at least for theoretical purposes, it is just as viable to say that two statements, even if they're 'exactly the same sentences,' occuring at different times or produced by different people, are different. And then perhaps we can get at what are some of the viable notions of 'sameness' for activities, via a consideration of what it is that can be said to be 'one statement agreeing with another.'

Now, for Members, 'making a statement' is seen to be something different than simply uttering a sentence; that is, it becomes an activity for which language is used, but which could be done in other ways than the particular way it was in fact done, and still be seen as 'the same thing.' You could say it differently and it would still be the same statement. And furthermore, the activity of building it could have been directed to 'producing a statement that is the same as some other statement that some other made.' And it could be recognized as that, which would then involve seeing that a statement had been made that was 'the same' as yours, without regard to the fact that it was made

by somebody else. And that, then, involves some notion of studying actions, and leaving the actor in it as somebody who can be seen to be irrelevant, for some purposes at least.

Again, a notion that statements can be 'the same' though the sentences are different is by no means an obvious one. And of course the essence of the notion of 'ceremony' often is that *exactly* the statement – whatever that might mean – has to be redone or failure will occur, if the statement is powerful. Where, then, memory is the crucial matter, and memory has to be helped by very special techniques – most particularly, the use of poetry as a mnemonic device.

The forms of poetry become the ways that information is captured so as to be reassertable in just the fashion it was first asserted. And that is the basis of Plato's attack on Homer. In the *Republic*, where Plato attempts to reformulate the problem of knowledge for the Greeks, he launches a very concerted attack on Homer, proposing that Homer is the storehouse of knowledge for the Greeks, but it's lousy knowledge. Its effectiveness, however, is given by the fact that it just gets built into everybody's memory via the poetry, and if you're going to have a progressive knowledge, you have to undercut that form. That issue involved in Plato's attack on Homer has been recently dealt with, in some detail, in a book about oral knowledge called *A Preface to Plato* by Eric Havelock (Harvard University Press), which is much worth looking at.

In any event, for those kinds of things it's taken to be that the statements are powerful in some way or another, and if they're followed exactly, then some set of consequences will occur. And for matters that were so frozen, 'agreement' has to be irrelevant, and the notion of 'agreement' might never even emerge – it's simply an issue of repetition.

Now the emergence of a notion of 'agreement' as a possible thing that can be sought and dealt with, is, for purposes of available history, to be marked as an invention of Socrates, I suppose, for what was characteristic of his technique was that he was willing to start with any statement that the person he was talking to held, and then bring him to see that that statement and some other statement that he would make were inconsistent, and therefore that there was something wrong. It seems absolutely obvious to us that if they are inconsistent there is something wrong, but presumably that had to be learned as a complaint. If you took it that what was said yesterday need have no relationship to what was said today, what was said in one context need have no relationship to what was said in another, and in any event that persons were well formed and ethics were consistent – whatever they were, they were consistent – then no such attack as that which Socrates launched, could be made.

Now Nietzsche in his fantastic attack on Socrates – a chapter in, I think, his book on Wagner, called 'An attack on Socrates' – sees just what it is that Socrates is up to, and treats him as destroying the Greek ethic; an ethic which didn't involve people having to know what their views were, they just 'acted' as he puts it, and they didn't have to have answers to questions as to what

their opinions were. And when they had to, the society became sick, and subject to the kind of undermining that Socrates wrought.

This phenomenon of 'inconsistency' that Socrates used, is a criterion which can have a kind of a strong appropriateness for a discussion, but it was transformed into a strong criterion of a total ethic. That is to say, one was to live one's life with a notion of 'consistency' operating for *any* set of activities, where, then, the sets of activities become things that are routinely transferable into statements, and the statements are to be compared, and by comparison of the statements one can decide their consistency. And if that's the use, then one can begin to see what relationship there is between, as he claims, knowledge and virtue. One was bound to be unvirtuous if one did not produce a set of activities which, once transformed into a set of statements, would be found to be consistent. And it's too much to expect that without a statement, i.e., a set of rules, which one used in generating any given activity, one would build consistent activities.

The notion of 'inconsistency' has become enormously powerful, and is now used as an explanation for all sorts of troubles, leaving completely aside the issue of its use in, say, logic. One gets theories of psychopathology which turn specifically on the presence of inconsistency; where, for one, the project of some psychotherapy is the production of consistent activities. And these can get very fine. The Bateson 'double bind' theory of schizophrenia proposes, for one, that the basis of schizophrenia – or that schizophrenia that they study, anyway – is that the pre-patient is subjected to at-the-same-time-inconsistent activites. So that, for example, in a statement that the mother makes that's invitational, she also engages in activities that are rejectional. In an activity she does that's loving, she also does an activity that's hating. This, then, is supposed to generate confusion and the rest, and produce schizophrenia. Where what has to be core to that is the effectiveness of consistency or inconsistency – and that, of course, is a historical invention.

It's a very magical idea, agreement. And it's treated as magical ideas are treated, i.e., wishfully: 'If we could only agree then everything would be alright.' And how it is that, agreeings having been reached, the world is then relaunched on a solid basis is not really enormously clear, but involved in it are those notions that also give rise to the hopes for language reform and what it would do: 'If only we had better communications,' 'If only we used, not a natural language which is heir to all the historical difficulties that it has, but some language constructed by logicians or proto-logicians, then the great range of troubles that we find in our world would disappear.' There's tremendous hopes involved in what it is that language can do, which are partially involved in overcoming what it is that language does.

I suppose pretty much any conflict that we have eventually gets formulated as one that discussion could remove, where it could remove it if discussion could produce agreement. The set of projects that have been generated under such a hope include things like the United Nations, and so on. And we could ask what would be some basis for any such hope being entertained. It could hardly be Socrates' successes, because after all he was forced to take poison in

the end. And if it's such things as the fact that occasionally in a household, if there's a dispute as to when it is that one should go to sleep, or what kind of car one should buy, or the like, discussion can resolve it, you're getting a rather fantastic extension. But then, discussion is something that everybody knows about, and agreeing is something that everybody knows about, and perhaps it is, then, a kind of institution which can appeal by virtue of its familiarity, in the sense that Christ appealed with love as something that everybody ought to know about, and hoped also to change the world.

Now it might appear that the focus I've given to conversation would involve me in saying that the rules of conversation are to be given such an enormous status. I point these things out to indicate that they seem to be given that status without reference to whether they can bear it. There are, then, a whole set of properties of language that have had some success, more or less limited, more or less great, for language, that are used to handle an enormous range of other things, presumably, in part, by virtue of the fact that those other things can be talked of, anyway, and therefore can permit an extension of the talk of them to those things that are talked of.

Methodologically, 'agreeing' is a tremendously troublesome thing to deal with, in that one needs, I guess, not merely a notion of 'same' for those things about which the agreements can be, but a notion of 'same' for the activities of agreeing. And that matter is normally simply supposed away. The formula for its being supposed away are things like social contract theories, conventionality bases of everything – or some things, such practical tests as, 'If it turns out to work then they must agree,' 'they can talk so they must agree,' at least on agreement, anyway. It is supposed away in almost any public opinion survey which would say 'Do you agree on X,' assuming that whatever it is that 'X' is may be problematic, but whatever it is that 'agreement' is would always be treatable as 'the same' for such purposes as counting, anyway. And if it varies, then you could write 'strongly agree' or 'weakly agree,' or whatever else.

Now what other properties are involved in the use of the notion of 'agreement' than those few I've mentioned, I could hardly say, and certainly we have to know. And what things are demonstrably doable for some aim like 'getting knowledge,' 'getting a piece of work done,' 'getting a proposal through,' or whatever else, with all those aims replaced by 'getting some agreement' on them, is another thing that has got to be examined, for the use of that image would be a basis for having technical specialists in 'agreeing' brought into any given problem to help in its resolution. And that, of course, is a good deal of the basis for the omni-presence of lawyers. That's what they're specialists in. The effectiveness of the use of people like that is another question.

There is, in short, no institution, I take it, that has had the hopes laid on it that 'agreement' has, since whenever it was discovered as something that could occur in conversation. Whether it can bear those hopes, and how it could bear those hopes are matters that, I suppose, require some rather direct attention.

Lecture 24

Measurement systems

Roger:	Well first of all you must be crazy or you wouldn't be here.
Ken:	heh heh
Jim:	Yeah that's how it goes.
Al:	Secondly, you must be an under-achiever.
Jim:	Yeah,
Roger:	You hate your mom and dad huh
Al:	—third of all.
Jim:	Oh, somethimes.
Al:	Fourth, you like to drive cars fast.

I'm going to talk about the phenomenon that we can consider via this statement, "you like to drive cars fast," most particularly focussing on "drive cars fast." There is a related discussion on the first page of the data handout.[1]

Now, there is a large issue lying behind an investigation of something like this phenomenon, i.e., talk of how one drives cars. If it is the case that there are *alternative measuring systems* available at any time when some new phenomenon is introduced into a culture, which the culture is measuring, then what is it that serves to control the selection of some measuring device from among the alternatives? And then, relatedly, what are the features we ought to use to compare measurement devices? The case of cars can be a fairly nice

---

[1] Following is a simplified version of that segment.

Roger:	I have got a speeding ticket on the average of one every three and a half months. Since I've been driving. And I deserve it.
Ther:	ha ha ha
Roger:	I deserve it. Because I always drive about seven miles an hour faster than everybody else. You know? Like everybody's driving thirty five I'm driving about forty two somethin' like that. So this is the conseque(hh)ence I have to pay. 'Cause I can't stand driving that slow. Specially when I think I can handle a car at that speed. In traffic.
Ther:	Uh huh
Ken:	Oh I can think of a million times when I should've gotten a ticket, going on the freeway. I'm always goin' seventy five. I mean I'm just I'm not racing, I'm right along with— or I'm right behind the guy ahead of me and he's just he's goin' as fast as I am and lotta people pass us up like we're sittin' still.

one because they are relatively new, and when they were introduced there were, obviously, a variety of measurement systems available. Furthermore, built into the car is one possible take-off device for measuring, i.e., the speedometer.

We could pose those problems directly, by virtue of consideration of how it is that measurement devices are used, and what seem to be their different features, rather than, for example, simply supposing that we ought to use the available mathematical considerations for deciding such issues, e.g., that the terms are 'ordinal' versus 'cardinal' or whatever else.

There is, furthermore, an issue which concerns the theory of ethnography involved in consideration of measuring systems. That arises in the following way: What is it that an ethnographer uses as some sort of base – if he's going to use a base – for constructing a formulation of some measuring system used by a tribe? The overwhelming tendency is to use some 'real' – that is, defined as scientifically correct – system, in terms of which one can formulate how it is that the natives go about measuring whatever it is that they're measuring. So, for example, color terms may be mapped onto the 'real' spectrum known by Western science. And one can, in that way, construct formulations of native color systems. It tends to be the case that even those anthropologists who consider themselves most radically oriented to an attempt to describe native systems of categorization – native thought systems – find themselves using their formulation of the real world as a way of getting a hold on what the natives are doing.

Now when one starts with a line like "drive cars fast," one might suppose that one is right off dealing with *a* term from perhaps a set of terms that are in one or another obvious ways, more or less vague. 'Vague' by contrast to, even for the natives, an available clear way of formulating what they're doing. That is to say, one might, in parallel to a consideration of, let's say, color terms, put a speedometer on the blackboard and map onto it the system of terms used, and say, then, that for Americans, or California kids, or whatever, 'fast' means from point one to point two, 'slow' means from point two to point three, etc., where you would say that 'vagueness' arises at certain places. It's not clear whether 50 is 'fast' but it is clear that 90 is 'fast.' It's not clear whether 30 is 'slow,' but it is clear that 15 is 'slow.'

And you could construct a testing procedure, which would have partici- pants telling you which are 'fast' and which are 'slow' positions on the speedometer. And that might be a way for you to decide, for example, not simply that they use a stable set of terms, but whether those terms are psychologically real or not. So, for example, it is proposed as a development in, say, componential analysis, that one can or cannot construct psychological dimensions to the various terms that they analyze, and that one can see whether those terms have a psychological reality via some such test as I've skteched.

There are serious problems with any such conception. The ways that one might procede to get at them would involve a questioning of the notion that one's procedures are in the first instance to hit some base which the natives

must, after all, be coming to terms with. Where essentially their activities are to be seen as 'coming to terms with some phenomenon,' such that one could then explain, for example, the defects of their system, by virtue of other interests that they may have, or by virtue of the simple inadequacy of their conceptual systems – a matter which is obvious enough, they're primitive.

If, however, we seek first to take a set of terms and see how they work, examine some of their virtues, perhaps, then we might be able to work out what are the criteria for usable measurement systems. And then set up a way of comparing alternatives to decide which ones are 'better,' and arrive at some way of seeing how come they selected one or another. One might not, then, arrive at the conclusion which sees a system in which 'fast,' say, is a term, as being more or less defective.

And it's in such a kind of general light that one would come to look at what is otherwise, I suppose, a rather dull remark, "You like to drive cars fast," which might also seem analytically opaque, i.e., what could you do with it?

The set of terms of which it is a member seem to be extremely simple, and the task doesn't much involve the location of them, but consideration of them once you have them. Essentially there seem to be three: 'Fast,' 'slow,' and 'with the traffic.' They have some extraordinary virtuosity of use, which virtuosity seems to be involved in the fact that they *are* used, and those are things which we might just begin to pick off – where, among other things we want to get to eventually, are considerations of what is it that provides for their usability, as an issue. Now that problem is kind of a neat one, and it's one that you might not get at if you started with a speedometer.

For example, if you started with a color spectrum as what had to be come to terms with, you might not easily come to a direct consideration of the special usability of the set of terms that were in fact constructed, and, furthermore, the special considerations that permit their use. For the considerations in the case of the color spectrum would essentially be that the physical world was so constructed, without regard to some given tribe's problems. And, at least in the case of these speed terms, that's not the issue at all.

The core thing about their usability, for one, is that persons can be seen to clump their cars into something that is 'a traffic,' pretty much wherever, whenever, whoever it is that's driving. That exists as a social fact, a thing which drivers do, where it's when that *isn't* usable that you have some trouble seeing how you're driving, i.e., on roads where there are no other cars, or only you and another, perhaps. And by 'a traffic' I don't mean that there are some cars, but there is a set of cars that can be used as 'the traffic,' however it's going; those cars that are clumped. And it is in terms of 'the traffic' that you see you're driving fast or slow.

But it's not the business of anybody to set themselves up as a kind of a culture hero because they make it their business to be 'the traffic' wherever they happen to be, so as to allow others to orient to them. I say that not without some irony, because Robert Merton would have them be a kind of

culture hero; they are the people who make it such that everybody else can do deviant activities. That is, you can imagine those people who are driving in a clump as permitting the measurement system to work, taking on the character that they sacrifice themselves to others' pleasure, etc. Like the middle class would talk about their existence as providing those things which Beatnicks can deviate from; having, then, a kind of heroic status. They sacrifice themselves to permit a set of facts to occur, which permit others then to see how they can have a good time violating them. It's a perfectly legitimate way of thinking of themselves.

Again, the core point being that it's not a law of nature that there is 'a traffic.' Some people go about driving in such a way that permits themselves and others to see that the traffic is going at whatever rate it's going, in terms of which some can go ten miles an hour faster, or whatever. As compared to the fact that it is a law of nature that the spectrum has certain properties.

Let's consider some of the features of this system. First of all, it's not only the case that you can at any given point decide that you're driving fast or slow or with the traffic, but the same sets of terms are used to formulate how you drive in general. Secondly, that set of terms permits you to decide how anybody in your view is driving, on any given occasion: He's driving fast, he's driving slow, he drives like us.

That's one set of things. But what we also want to see is that the comparisons that are set up can be used across whatever driving conditions there are, and whatever speed laws there are, such that two drivers can talk to each other, consider how it is that each drives, where they don't know, for example, where the other is from, what the speed laws are, what the normal conditions of traffic are, etc. "How do you drive?" "I drive fast." "I drive fast, also." Where what the conditions are under which you drive, and what speed you drive at when you're 'driving fast,' are irrelevant.

Now that means, for one, that one tends to see that the fact of 'a traffic' is not simply an incidental occasion for the piece of road on which you now are, or the piece of road over which you've traveled and are likely to travel later, but that wherever people drive, they drive that way, such that, for example, you can move from place to place over time and find yourself in a setting which you can orient to as having those features. The stability of the terms and the conditions under which they're usable, are then such that time, place, speed laws, whatever else, are all irrelevant to their use. Changes in speed laws, changes in the capacity of the car, changes in personnel, new generations, new places – this thing can hold.

We might consider what would be involved were one to have replaced these terms with a set of numbers ("Now I'm driving at 37 miles an hour" or ". . .40 miles an hour") and consider the conditions under which a set of numbers might be usable to do the range of tasks that this system is usable for. For one, perhaps, one would have some rather complicated problems in arriving at a notion of how one drives. Would you do a random sampling over a year? Would you have to throw out your past experience as cars change? As the laws change? Would you try to consider the relevance of the

fact that you regularly drive for some part of your time through school districts? On freeways? How could you talk to another? What kind of information would be required to find out what life is like for him? And there is no intrinsic reason why one shouldn't see a set of positioned terms as 'clean.' Except by virtue of the fact that one takes it that a set of relative numbers defines what would be 'clean,' and that the terms are positioned via the numbers, rather than that they are positioned with respect to each other.

For all we know, with this system, a term once having been arrived at, whatever it is that happens in the future, it will be usable. It might, however, provide for some real difficulties, e.g., for those people who 'always drive fast,' that might get them into trouble insofar as they do regularly orient to the traffic to decide how fast they're going to drive, i.e., faster than it. Then, of course, the traffic can control the kinds of deviations that occur.

In any event, there is a kind of extraordinary adaptability to the use of this system; such matters as having a set of terms which are usable at any time, where the same set of terms is usable to formulate how one characteristically proceeds, and furthermore, can be used to compare how one is driving now with how one characteristically proceeds. To compare, also, oneself with anybody else. And to do that comparison without any concern for the particular speeds, conditions, etc., under which the system is used.

What we want to ask, then, is whether such virtues – if they be virtues – are important to the selection of some system, and the extent to which what's important is that there be some set of persons who make 'the traffic,' and who make it as an unassigned task. In that regard, it's curious that you can regularly tell, as you move up to a clump of cars, for example, that somebody *is* making the traffic as a task. You can tell from the rate at which 'the traffic ahead of you is moving' that, for example, it's being made by a cop sitting in front of it.

Another question is, can a thing like this be used if it's only partially used? That is to say, if not pretty much anybody who learns to drive learns to use it? Where, if for some measurement system it's important that pretty much everybody who does the activity for which it's relevant uses it, that's another set of constraints; a set of constraints which such a system may more easily satisfy than, say, speedometer readings and the kinds of comparisons they set up – unless, of course, it were the case that, for example, there were no variation in speed laws, and that the speed laws were taken to define the point one should arrive at, i.e., if the sign said '40 miles an hour,' then one speeded up until one got to 40 and held it at that.

Now if a system like this is used, and those people who deal with the system – who enforce the laws and deal with accidents and the like – don't really attend to it very carefully, it may have a range of consequences, itself. So that, for example, it may be no solution to the problem of fast drivers and the troubles they get into with others, to raise or lower the speed limits. Furthermore, in a situation where there was any kind of occasional variation in the rate of speed, like an accident, like a road being washed out, like a highway being repaired, there might be tremendous troubles if the given

speed that was posted were treated as the only norm one could orient to. But 'the traffic' can adapt to all such things, and 'fast' or 'slow' drivers can adapt to 'the traffic.'

It is, I suppose, a rather lovely problem for those persons who like to address largely the problem of social order, to ask what would (   ) do with the phenomenon of 'the traffic.' Or what would other theorists do with it? How would they explain it? Would they find it tremendously puzzling, i.e., everybody ought to be driving fast, if fast is something that permits expression of, say, strength, or whatever else?

Again, as I mentioned, it would be via such a system's use that we do get the troubles that we apparently do get; for example, people driving across the country, when they go through Montana where there 'is no traffic,' find themselves in a kind of situation of sensory deprivation, not knowing exactly what to do, how to deal with the occasional car, or the kind of misery one feels when a car one has been using decides to leave the road. That is, the sorts of things that would be more or less irrelevant, were it the case that one had as one's trusty guide a speedometer, and that's it.

Lecture 25 [Incomplete]

'Company' as an alternation category

Al :   Now let's see what else can we decide about // you.
Roger :   Hey don't tear him down.
Al: :   We're – Ok
Ken :   I've been // torn down // for (   )–
Al :   (//   )
Roger :   We got company heh
Al :   (hh)Oh Ok.

I want to talk a bit now about this line "We got company." It's the first assignment of a category to this fellow since he's come, and what we want to consider is the sort of category 'company' is, and what's involved, perhaps, in its use here and now (that is to say, there and then).

The category is an *alternation category* to a whole series of membership categories, each of which has it as an alternation category under some circumstances, i.e., there could be 'family'/'company', etc. But wherever it's used, it is used as a category in alternation to some group. And there are certain things in common in its use, and for those terms that it stands in alternation to. For example, I think it's the case that what it stands in alternation to is regularly something which is territorially constituted. So that if the three boys and this fellow were co-present elsewhere, they might not talk of him as 'company.' And, for example, it is by virtue of somebody arriving at a family's house that they may be seen to be 'company,' whereas in other circumstances his co-presence is not that sort of thing.

Of course for some of the categories that have 'company' as an alternation, the category is usable when the alternation category is not, i.e., a family in some places other than their house is still 'a family.' But this set of persons may not be 'the group' in other places and times. To use that term 'company,' then, can be a way of invoking the fact that at this place and time, they are constituted as something that has proper members.

Now for "We got company" there's a question of who 'we' is. And it can, perhaps, get a fairly decent solution by virtue of the fact that 'company' is used in alternation to it, where we can ask who is it that might not be permitted to say they "got company." I suppose, obviously, the therapist. What *he* "got" is a patient. 'We' then, may refer to the members of the group; i.e., the patients other than this new one. And if it's the case that the therapist might not properly refer to this fellow as 'company,' then the fact that they do so refer to him has some real interest. We can come to ask what

441

uses 'company' has for them, and consider the other things that they could refer to this fellow with, and what they might involve.

'Company' is *an* alternation category. What, then, might be, for example, other alternation categories, from which one was selected – this one. And then, furthermore, what is to be said about the fact that any alternation category was chosen, since it's at least plausible that under some circumstances they might not be in a position to use an alternation category, but, given the fact that the therapist has selected a new patient, he might, by that alone, be 'a member of the therapy group,' not only from the point of view of the therapist, but from their own. That being possible, the sheer fact of an alternation category being used gets a clear relevance. [*tape cuts off*]

Lecture 26

Being 'chicken' versus 'giving lip back'

Al: Tell us all about yourself so we can find something bad about you.
Ken: Yes, hurry up.
Roger: Well first of all you must be crazy or you wouldn't be here.
Ken: heh heh
Jim: Yeah that's how it goes.
Al: Secondly, you must be an under-achiever.
Jim: Yeah,
Roger: You hate your mom and dad huh
Al: – third of all.
Jim: Oh, sometimes.
Al: Fourth, you like to drive cars fast.
Jim: Yeah,
Al: Fifth you like to ta – you like uh wild times,
Jim: Mm hm,
Ken: He smokes like // me, see?
Al: Sixth you like booze,
Jim: Huh? // Yeah
Al: Seven you like to smoke
Jim: Mm hm
Roger: And seven you've been arrested for rape and other things.
Al: Eight you heh
Jim: No, not that.
⎡*Ken*:   hehheh
⎢*Jim*:   hehh You're gonna ta(hh)1k
⎣*Al*:   Eight you – Eight you uhm give lip back to everybody
Jim: Yeah,

   I'm going to talk this time about the line, ". . . you give lip back to everybody." Let me give it some context. One of the things I think it's relevant to, and what, in part, I'll be directing my remarks to, is the statement that starts off the sequence of questions (or comments, or remarks, as they may be) in the group therapy session, "Tell us all about yourself so we can find something bad about you." I want eventually to be able to see if we can come up with an analysis which would show how such a statement could be made to anybody. That is to say, that one could be able to say to anybody that

443

if you ask enough, and they say enough, then something bad about them will be found.

In constructing a solution to that, I want to be able to do it in what would be the most interesting way. And what I'll be doing, then, is building an analysis which is not anywhere near as general as we need, but which may deal with matters that would be involved in a more general solution.

What would seem to be involved in a general solution is a situation in which there is a dilemma which can be formally arrived at, and where – if there are two choices – either choice can, under one or another formulation, permit the statement 'you've done something bad.' If we can find that there are some general dilemmas which can be formulated as holding for anybody – under some formulation of 'anybody'-dilemmas having this characteristic that either alternative can be seen to be 'something bad,' then we would have a nice way of showing that the statement "Tell us all about yourself so we can find something bad about you" could be shown to be true. The dilemma itself, of course, would have to involve some action-alternative which everyone would face. So we need a dilemma like that, which we don't have right now.

So one of the first tasks is to get us the sort of dilemma that this statement names *a* solution to. And that's what I'll try to talk about now. The first thing we want to notice is the following. We could have a reading on ". . . you give lip back to everybody" which involves, let's say, taking each term one by one, finding what it means, and then seeing whether the statement adds up. So that, for example, taking 'everybody' independently of what's gone before, we could say the statement's absurd, simply by virtue of the fact that we can suppose that he hasn't talked to 'everybody.' The question is, is that the way to find out what 'everybody' refers to?

What I want to propose is that such an idea would involve a possible proper sense for 'everybody' if, for example, we had a statement like "You say 'hello' to everybody," where what's involved in that is that the action you do is the same action – saying "hello" – to whomever you do it. Whereas I think it's the case that whatever it is you might do – say, being insolent – it would only be 'giving lip back' to a special class of people. Then, given the fact that you could only do 'giving lip back' to a special class of people, it might be that you do give it to all of *those* people, on the occasions under which you can. So 'everybody,' then, would have a rather more restricted sense than it could have independently, by virtue of the fact that there are only some people to whom what you're doing could be considered 'giving lip.' And there's a brief characterization of a possibility, earlier in the session, on the second page of the data handout. They're discussing cops, and Roger says:

> *Roger*:   He can bust ya on a thousand things non-moving violations if
>   you give him any lip, even if you didn't do anything wrong. They
>   can just go over your car and write you up ticket this long.

It's in the first instance kind of curious that on a variety of references to this

phenomenon 'giving lip back,' extremely similar sorts of events are pointed to by kids as occasions under which it could occur. And apparently it is something that they all take as a possibility, so that if, to "you give lip back to everybody," he'd said "no" instead of "yes," then, I take it, it wouldn't be heard as saying, for example, that he's never had the occasion to do it, but that having had the occasions, he didn't.

Now the question is, can we formulate some class, of which this fellow is a member, and for which, given the restricted information they have of him, such a situation would involve this kind of possibility, i.e., 'giving lip back,' which will give us the dilemma we need?

We need some kinds of rules and some kinds of categories – very simple ones. Now one of the things we want to notice about that piece of conversation I just quoted is that the interaction under which 'giving lip' might occur has, before 'giving lip' arises as a possibility, a formulation of who it is that's participating – a cop and a kid – where the 'who it is' is given by the thing that's happening. That is to say, this fellow was driving, and was stopped by a policeman, as a possible violator. And one of the things that is regular about that, is that the possibility of 'giving lip back' occurs in situations which have been formulated by reference to some such categories. For example, in interactions between high school teachers and students, in interactions between parent and child. Where we have some first event that takes place, done by other than the kid, which formulates the event as one for, e.g., parent–child, teacher–student, policeman–teenage driver, etc. Those can be things like a request or an order, which provide for the relevance of the categories by virtue of the fact that the request or order ought to be accepted by virtue of the categorial relationship between the parties. 'Do the dishes,' 'Put the cat out,' are things for which the warrant is that a particular category of person told you to do it, and thereby provides the relevance of that category and whatever alternation there is to it. For example, 'pulling you over' is something that 'a cop' does, and thereby provides the relevance of that he's 'a cop' and you're 'a teenage driver.'

So we have some action that they do, that provides the relevance of a pair of categories for the given interaction. Where, for one, that pair of categories, under some formulation, provides that given the first action, the kid ought to do some second action. Given the fact that you've been told "Put out the cat" by someone who stands as 'a parent,' you ought to do it. Given the fact that you've been told "Pull over" by someone who can be seen as 'a cop,' you ought to do it. We have, then, a pair of categories, and a first activity.

There's a general rule which seems to operate for any of the X categories (cop, teacher, parent, etc.) and that alternation category, 'kid' (or whatever variation on 'kid' that we would have; child, student, etc.). We could go about formulating a series of alternatives. One could be, for example, there might be a general rule that said 'Don't be insolent.' Then there might be another general rule, which need not be inconsistent with the first, which would go 'If somebody is nasty to you, then return it.' The latter would deal only with possible second statements. Then it would be the case that if some

person who ought to follow the first rule violates it, you can properly follow the second rule. For anybody.

Now, whether or not there's a general first rule like the one I've proposed, is not terribly criterial for our purposes. What we need is to notice that there is a rule which holds for any of those X categories and the alternative ones that says: As between some pair of people, insults are non-reciprocal. That is to say, whatever they do to you, you don't do it in return. That rule, and the prior second-statement rule I mentioned, can be in conflict. That is, that second rule said, 'If somebody does something like insulting, then you can return it.' And this one says, 'For some people, if they do it, you oughtn't.' Of course they needn't be in conflict in any given situation. Those people to whom you should not return insults might not give them to you in the first place.

As it happens, while the rule that says you can return an insult is quite general, for certain groups, like kids – most particularly kids – it has achieved a special status. It's not simply permissable to do it, but, for one, as I earlier mentioned, there's a game in which that is central (the game called 'tearing down,' also called 'sounding,' also called 'playing the dozens' and a variety of other names). And secondly, the alternatives to a first event that consists of, say, an insult, are both scorable; countable. That is to say, if you do return, you show you're not afraid. If you don't, you show you're chicken. So we have, then, a situation where there's a possible second event, and there are two ways in which it could be dealt with. For kids, to either of those there's a given assessment: One is 'ok,' the other is 'coward.'

The initiating event has, in the case of the data we're considering, been formulated as 'having the car stopped for no good reason.' It has occurred by virtue of the fact that the driver of the car is a member of some kind of alternation category, i.e., 'teenage driver,' 'hotrodder,' or some such thing as that – a matter which, for purposes of stopping a car, is supposed to be irrelevant, but which can be seen by both parties to have been the relevant criteria for the interaction getting started. And which can be seen by the driver of the car, specifically, to have been illegitimate.

And if it's not a situation with cars, then the same formal situation will be picked out by other kids to pose the same problem. Negro kids will pose it by reference to their having done nothing; having been stopped by virtue of the fact that they are Negro, and thereby people who are liable to do something delinquent. Gang members in high schools formulate the matter in just the same way. They focus on some situation in which the teacher tells them to do something, where there's no account available except that it was done by virtue of the fact that they are obvious gang members – and of course that could be obvious in a variety of ways.

Now they each take it that in such a situation, the first act is some sort of illegitimate one, but an illegitimate one of a special sort: It's one that, while being illegitimate, nonetheless can have a guaranteed success for the one who does it. In the case that we started with, there's the fact that the cop can give you non-moving violations. He oughtn't to stop you unless he has good

grounds. If he stops you, he can always find something that would have added up to good grounds. That is to say, it won't show up that he, in fact, didn't have any good grounds. He can give you a ticket, and that stands as an account.

I've mentioned that methodology before, i.e., that *an* account can stand as *the* account. It's terribly powerful, and to see the character of its power one need only to notice the following: Even though they attack it, the series of questions they produce is really in its fashion, another case of the same thing. That is to say, they ask him a series of questions which could add up to how it is that such a one as he might have gotten to such a place as here. If they find grounds, then they take it that those *are* the grounds.

Let me just give a citation while I have it in mind. There's a paper by Carl Werthman, 'Delinquents in schools, a test for the legitimacy of authority,' *Berkeley Journal of Sociology* (1964), pages 39–60. In there can be found a whole bunch of parallel cases; enormous amounts of data in that paper. There's more data in that 20 pages, than in just about all the publications on juvenile delinquency put together.

So: These various people in authority do something to that person who they formulate as 'a kid,' something which is illegitimate. And it is specifically illegitimate in the sense of picking up some aspect of the categorized state of that person (the 'kid') which is supposedly irrelevant, and using that as the occasion for doing that thing – stopping him, telling him to do something, etc.

The matter is a little bit nicer than that, in that kids take it that cops, teachers, etc., engage in an act like that with the specific aim of putting the kid into a position that has no good solution. That is to say, they don't just happen to pick up a kid because they feel like picking up a kid, knowing it's illegitimate, but they pick up a kid knowing it's illegitimate, and knowing the kid sees it as illegitimate, and knowing that the sort of kid they pick up is put into a position of having to make some determination of what it is he's going to do. That is, either be submissive or 'give lip.'

And one possible reason that they do this is, given the fact that the alternatives are assessable by other kids – if the kid 'gives lip' then he's done something that other kids say is fine, if not, then he's done something that makes him a coward – then, when these things are done in public, they provide, e.g., the cops with a chance to show some tough guy to be not so much. Where, for the kid, the alternative is if he does 'give lip' he's going to get arrested, although he'll stand well with his buddies, and if he doesn't, he might not get arrested, but he's been shown up in public.

In schools, the thing is used – from the kids' point of view – as a way of getting them out of school. Teachers know that the kids systematically will respond by 'giving lip back' – the gang members, that is, who are in any event a pain to the teacher. They'll force the situation. And what the kid does provides an occasion for having him kicked out of school. Now it's beautifully generative in its fashion, in that if you have a bunch of kids in the same gang, then you need only get one of them who's willing to stand up to the teacher,

for all of them to eventually get kicked out. That one stands up, he gets kicked out, each of the others have their turns and have to show they're equivalent, or else. It's not, then, for one, a chance matter that kids get kicked out of school in Negro slums at the rate that they do.

Just to run through it again, then: What we have to have is a mechanism of the following sort, for it to have a kind of guaranteed working. You need somebody who's not merely 'just a kid,' but who stands in some observable status as a special kid – 'hotrodder,' 'gang member,' various other such things. And you need somebody who stands as a member of one of several special categories by reference to that kid – 'cop,' 'teacher,' 'parent,' etc. Then you need an occasion when some activity can be done by somebody who can, by that activity, formulate themselves as in one of these special categories towards that kid. That activity will be some 'first action,' done by reference to the special status of the kid, where that special status is specifically irrelevant to doing the first action properly; that is to say, e.g., he shouldn't be stopped because of that status. That is the first move. And it ought to be done in public, where 'in public' means that at least some members are present of the same category that this kid is in, so that he has relevant that category's set of rules and its consequences.

Those rules would be relevant in any event, under a situation of an insult – it doesn't have to be that a cop does such a thing. If any kid walks by a bunch of such kids and makes a remark to them, then these things should be operative. But if any kid does it, he can perfectly well be given back the insult without any such systematic situation operating as does when an adult does it – and particularly an adult in one or another authority status.

Now in part we have a question of why is it expectable that anybody in such special categories would have that happen to them? Well, in the first instance, as we discussed a while back, those categories are set up specifically by the members with such an aim in mind. That is, they are set up *as* an affront to authority, in order to set up a game, and to announce the fact that we are hotrodders playing the game, against you who are supposedly controlled by the fact that you can't consider that when you decide whether we're speeding or not – where it's part of our business to be specially noticeable.

Under those sorts of circumstances, a question like 'you give lip back to everybody' in this sequence, can provide as one of its further questions that you've been kicked out of school. The alternative answers are tremendously criterial as to what sort of kid he is, if the alternative answers are to be believed. And note the kind of curious fact that only one of them would be non-believed, and that is 'yes.' If he said 'no,' he's presumably not lying. If he says 'yes,' he may be lying. (That gives us a situation which may be similar to saying to the question "How are you feeling?" "Fine." Said to some class of persons, it may be a lie.) If it is the case that only 'yes' would be heard as a lie, then, that there is a norm for kids to 'give lip back' under such circumstances gets a rather nice way of being seen. That is to say, one takes it that one would only lie to another kid in the direction that involves

conformity with the norms that hold between kids, and not the other way around.

Now I just want to notice one thing, and it's extremely tough to give a decent formulation of. The term 'bad' can gain a lot of its power with reference to dilemmas like this, by virtue of the fact that it can have two ways of being heard. One is 'bad,' and one is "bad," in quotes. Where "bad" in quotes means 'bad' by reference to adult considerations, and 'bad' means by reference to our considerations. Now that could be just in general, where a quotative use of such terms might refer to that use of it which would be made by some category that stands in alternation to ours. And the non-quotative use could stand by reference to our use. So if you do one thing you're 'bad,' and if you do the other thing you're "bad." What we want to find are some activities which hold for anybody, not formulated by reference to, say, 'kids' or 'hotrodders,' in which that systematic situation for 'bad' holds for some action that they can expectably all face.

Lecture 27

A mis-hearing ("a green?"); A taboo on hearing

Roger:	Are you just agreein' because you feel you want to uh . . .
Jim:	Hm?
Roger:	You just agreeing?
Jim:	What the hell's that
Al:	It's // Agreeing?
Roger:	Agreeing.
Jim:	Agreen?
Roger:	Yeah.
⌈*Al*:	With us. Just going along with us.
⌊*Ken*:	Agreein'.
Jim:	No.

What I want to consider now is a little of what may be involved in the troubles that are present in this segment. Let's assume for the moment that Jim's failure in the first instance is a mis-hearing, or the inability to hear what he's being asked. We can do that initially by virtue of the fact that, for one, *they* take it that that's what the trouble is, and also that he uses a way of marking his trouble which has that use in the first place; that is, the question "Hm?" which is a way of saying 'What did you say?'

Then we can ask why should he mis-hear that or not hear what it is that's being asked? I suppose one could say, well, maybe it just wasn't clear. To that, there are a variety of returns. One of them is that it was heard by somebody other than the one who said it i.e., "agreeing" is volunteered by another than the one who asked the initial question. And when the item is repeated a series of times, he still doesn't get it. So even if it wasn't clear in the first instance that "agreeing" was said, he might have picked it up after a bit, but he doesn't. We want to ask why he doesn't, and what sort of question it is, that it involves such a response to it.

What that involves us in asking is, how is it that to some extent the fellow who's being questioned is attending the questions that he's being asked? Is he simply dealing with them as singular events – one question, whatever it is, another question, whatever it is? Or is it the case, perhaps, that there's some relevance to the fact that he got a series of questions, and perhaps also that the series is introduced by what could be seen as a rather general problem that's being investigated by them (i.e., "Tell us all about yourself so we can find something bad about you"), and further, that the series of questions can be seen – with that pre-first question and perhaps even in part independently of

450

it – to have common features. So that the entry of another question to that list would be understood by reference to what sort of features had been present in items on that list. That is, he's able to detect a common property to the set of questions, which he can use to monitor a next – to decide that it's one of them, and which it is. And that would involve that in some sense the numbers ("First of all," "Secondly," etc.) are not incidental, but that there is a series with a number attached to each, and that has some significance for deciding what it is that would be said with one of those numbers, or as part of the series.

He may, then, be coming to use some way of seeing a next item by virtue of the previous ones. And what that might give him is something like the following: 'Are you a [something]?' Where what follows 'Are you a' is some membership categorization category that it turns out he doesn't know. Something similar, for example, to what's later asked, "Are you a hood?" He's been getting questions that run, 'Are you like a such-and-such,' 'Are you one who got kicked out of school,' 'Do you give lip back,' etc. 'Are you an underachiever.'

Then, his problem for 'Are you a [something]?' is finding what that thing is. He may hear something that's incomplete, in the sense that he hears 'Are you a green . . .'? where that might be 'a green what?' Or he may hear that 'a green' is something that they know of and use, which he doesn't know of. Some technical term of sorts, some 'in' term of sorts – where it would be that sort of thing by virtue of the prior set of items. He would apparently take it that the questions have a kind of linear extension in which it's perfectly reasonable to use what has been developed in them to see what the next would look like, where that in fact controls what he hears, so as to hear, indeed, a puzzle, when he could hear something perfectly clear.

That matter could be one that has rather large theoretical interest, in dealing with the detection of speech and its understanding. Insofar as the issue has been investigated in any interesting way, it turns on questions of the way puns are built, and such things as hearing or not the correct word where a possible homonym is used. One of the nice places, I suppose, to investigate the problem, concerns obscenities, and there's an extremely lovely article by E. R. Leach, 'Animal categories and verbal abuse,' in Lenneberg (ed.), *New Directions in the Study of Language*. Among the things that's pointed out is that one can, in routine talk, use a set of words which are more or less unprintable epithets, and they're not heard that way at all.

Now the tabooing of the hearing of obscene homonyms is an extraordinarily interesting thing. To see how interesting it is, you need only consider occasions when one has opened up the situation of obscenity, and then tried to avoid the hearing of almost anything that could be heard as obscene as *not* obscene. That's the way you get a chaining of humor, in that once obscenity has been done it takes rather a while to return to a non-hearing of the obscene possibility of the words used.

If you consider that sort of thing, then one could begin to see the possibility with 'a green.' And that is, that it would just not occur to him to listen to the

object; perfectly plain on the tape for example, and perfectly plain after there's been three or four repetitions of it, as being a single word and not two words, one of which is 'a' and the other of which is some noun that he doesn't know; a membership noun of some sort. And given the fact that the context – that is, the set of questions – are usable, we have, then, some very nice evidence that those set of questions are used to monitor a next.

Now that next question involved a shift in the kinds of questions that have been asked, and not at all an incidental shift. For one, it's related nicely to what his own procedures apparently are for listening to those questions, in that it's a kind of complement to them. What's involved is, he's been using their questions to formulate a way of seeing what a next question would be, i.e., he's seen some pattern in the set of questions, and hasn't, apparently, attended to the possible observing of a pattern in his set of answers.

I say that the shift is not incidental because being prepared for such kinds of shifts, attending to them not only so as to hear what they are, but in the first place attending to them in the production of a set of statements which can be subjected to that, is one of the fundamental things that takes place, and has to get learned, to be able to do this sort of therapy. I'll say a little bit about that.

One of the things that tends to be assumed by new patients to therapy – and even, for that matter, relatively wise patients from certain sorts of therapy – is that the situation is extremely similar to, for example, classical medical institutions, and what is involved is the following: There is some trouble in the outside world, you come in and talk about it, and you might get some advice or an understanding of what it is that your trouble is, out there.

In some of the American reformulations of classical psychotherapy associated with Harry Stack Sullivan and 'the Washington school,' the so-called 'interactionists,' psychotherapy involves, in part, the notion that what takes place in therapy is not merely just as relevant, but is also a part of the world which can be examined itself for finding what the troubles are. Where, for one, it would then be argued that discussions about the outside world, your troubles in youth, etc., are not a way of getting a good understanding of why you come to have the troubles, what they are, etc., but a way of dealing with your current problems in an easier fashion than to confront them directly, here and now. If it's older and outside, it might be easier to deal with. So what you have, then, is a situation in which any given interchange can form what is treated as the topic for the next: 'Why did you say that?,' where that clarification that can go on will permit an understanding of what it is that your troubles are.

It's a kind of shift, then, where one gets a piece of talk directed to the 'why' of a prior piece, where the 'why' is altogether local: 'Why did you say that *now?*' And sets of motives are employed which have nothing especially to do with the particular matters under consideration, except that the same issues might be found to be operative in behaviors there, as well as here. In that event, of course, the way in which one would have to be on guard – if one

wants to be on guard – is enormously heightened. For one, the fact of an attention to the ordering of the way you proceed within the session, and the use of that to formulate diagnoses, sets tremendous constraints on trying to hide in that room. Where, especially, there's not to be any constraint on the order of things introduced as explanations with regard to the things they apparently explain. That is to say, something that might seem to be perfectly trivial, nothing, never getting noticed, like, for example, the fact that somebody gets up and goes to the bathroom, is treated as an orientation to the group; something for which a full complement of motives can be assigned, and an explanation can be sought, and it can be watched for its future occurrence, and the rest. And that's what's done quite routinely.

What you have, then, is that they make this place into what they talk about as 'a regular society,' and what that involves is that any motive that motivates people, any known reasons that people have for doing whatever they do, however large they are, are now to be treated as usable with respect to any activity that they happen to do here, however otherwise minor it might be. So there are, then, a set of rules of relevance that are completely swept away, which have to do with, for example, the fit between some action and some reason for it. That you went to the bathroom because at that moment you had to go to the bathroom, would be a routinely usable explanation which is just about irrelevant here. He has to learn about those shifts, and learn what are the sorts of things that can be offered, and he would be expected to deal with, as accounts of whatever it is he's been doing *here*. In that regard, then, if he took the prior set of questions as a diagnosis, and his answers as permitting a diagnosis, then he's altogether misconceived what's going to take place.

But there are a series of ways that this question, "Are you just agreeing?" is much alike to prior questions. One of the beauties of that list of questions is that while it can come off as being surprizingly knowing about this fellow they haven't met, there's an obvious answer to how they know that, which is tremendously relevant to him, and that is, that they're telling him about themselves. What they're doing in that set of questions, then, is presenting information as to how it is that someone comes here, which of course characterizes from their point of view, how *they* come here. Then those questions are more or less true statements about themselves, as they see it.

In that regard, then, we could ask about, and he might eventually think of, the issue especially nicely tied with the question "Are you just agreeing?," which is, why should it be supposed that he would have so produced his answers? Why *that* reason for his answering as he did, but by virtue of the fact that they know that that's the way *they* did it. And then it comes to have a series of possibly nice properties. For one, you could ask, Well, why would they ask a question like that? since if in fact he was doing that, he isn't going to say it. It's a question that forces a 'no' answer, whether the answer is 'yes' or 'no.' There's a fairly decent answer to that: It could be a warning. Which is: 'If what you've been doing is just playing along with us, you'd better well

realize we could expect that that's what you're doing, and know that that's what you're doing, so you're not going to get away with it.'

That might be quite a frightening warning, and such matters are regularly enormously frightening. That is, one is put into a position where whatever one says is not going to be taken for what one says. What I mean by that is, the character of questions and answers as 'tied,' is most neatly found by virtue of the following: If you want to quote an answer to a question, you can perfectly well take the question and the answer and combine them in a factual statement which would go, 'He said he was kicked out of school once' or 'He's been kicked out of school once,' where there's a question and he says 'Yes.' That is, one doesn't quote 'Yes.' One takes it that he *said* whatever it is the question asked for.

Now, that's being changed around here. For one, it can be read as, simply, 'For some reason or other, to a question in which we gave him a possible answer, he agreed with the answer – and who cares whether what he said is true.' He's here, he's sick, and whatever it is that it was is irrelevant. The only question is, what does he do here? So you get a suspension of that kind of quotative use of answers, except to point to the fact that 'You said the following, and why did you say it?' That could be fearsome, because one might never know what they're seeing in some answer that looks perfectly plain, and for which you could offer all kinds of warrants if it came down to it – that is, e.g., you could bring in your expulsion certificate. The ways, then, in which one is going to be viewed, are possibly frightening because what you have as your best resource for deciding what they might find out, is what awful things you know about yourself.

But then, it isn't exactly as if a warning of that sort is offered by the therapist. It's rather softer than that. He's being told about a thing that they know about by virtue of the fact that they tried to do it also. And again, then, it's like the prior set of questions. That is to say, it can be seen as intendedly informative of how it is that they behave or behaved.

And these remarks can be tied back to my earlier point about taboos on hearing, in that the shift that took place is, apart from the fact that it introduces a rule about therapy, an altogether illegitimate thing to do, otherwise. And one of the ways you deal with an altogether illegitimate thing to do, is to not hear at all that it was done. If you could hear your mother saying some extraordinarily obscene remark, one way that you deal with it is to hear that she's saying something perfectly clean. In this case, he couldn't find what 'clean,' connected, statement was being made, and couldn't hear that sequencing violation. One doesn't, for comparative strangers, inquire into their motives for dealing with one.

I used the term 'strangers' at that point, not altogether incidentally. There's a rather exquisite place in Freud's article on first therapy sessions. Now, Freud is a tremendous stylist as a writer. And in that article he's talking about the question of when interpretations should be offered. And he wants to insist that they should not be offered too early. The way he makes his point, stylistically, is, elsewhere he always talks about 'doctor' and 'patient.' At this point he says

something like, 'You shouldn't tell something very deep to a stranger.' And in the next sentence he goes back to talking about 'patient.'

In any event, I take it that the locus of this mis-hearing is quite formulatable and probably very recurrent. And then, that the character of the boys' activities as doing diagnosis, is to be found in that sort of shift, and not especially in the set of questions that have otherwise been offered – as though one could compile an interview chart with a set of answers that would explain how come he's here.

Lecture 28
Intelligibility; Causally efficacious categories

What I'm going to talk about this time starts from a consideration of some pieces of the group therapy data. I want to notice the following sort of things; During the asking of the questions that I've been talking about, Ken says "He smokes like me, see?" and later on he repeats a version of that, "You gotta believe it we're the only two in here that smoke other than him" ("him" being the therapist).[1] And there are other things which I think are alike to that, such as, for example, at the beginning of the discussion of Jim's character, Roger says "He's not at all like Ken. He's more like Al and I." Another thing I want to be attending to is the statement, "This is an abnormal session, see, we're not together without the broad,"[2] and things like it.

   In the first place, I began to look at those because I thought them kind of odd statements. I thought that the first sort were odd because, for one, I wondered why, supposing that smoking is relevant to be talked of, he didn't just say "He smokes," or, were it the case that smoking were relevant and it were relevant comparatively, he didn't say "He smokes like Gene Autrey" or "like lots of people do," or a variety of other things. It's after all the case that smoking is not an enormously rare activity. And in that regard, the formulation in the second version of that statement, with its additional "other than him" was something that I wanted to wonder about. Why "other than him"? Why not "He and I and you are the only ones that smoke here"? And then, why "only"? There's only two other people left now – and furthermore, they're *all* smoking at the time.

   I found the second statement odd because it would seem like the most prototypical of rationalizations, in that I suppose we would take it that the most perfectly obvious reason that this is an "abnormal session" is that he's here, and not that she's not here. What's "abnormal" about it is that they have a possible new member to deal with.

   Now if those kinds of thoughts get us into a noticing of these statements, they need not control where we go with them. And there are, I believe, some extremely large issues involved in the occurrence of such statements, and that's what I want to point to in what I say.

   A first question that we can pose by reference to statements like "He

[1] Data handout, p. 278, just after 10:00
[2] Data handout, p. 276, just after 8:30

456

smokes like me" or "He's not at all like Ken, he's more like Al and I" is this: Given the fact that it seems that the names of persons are being used here to some large extent by reference to their incumbency in the categories 'patient' or 'therapist,' we might ask, are there categorization devices – any whatever or more than a few – whose categories can be used to formulate comparisons? And we'll have to consider what consequences that could have, were it so.

With regard to "This is an abnormal session, see, we're not together without the broad," we could ask: Is it in principle possible that any device, or a large number of devices, contain a set of categories which are, as we may put it, *'causally efficacious'*? That is to say, categories which can be used to formulate explanations of things.

And if that's so, that for either of those issues – comparison and causal efficaciousness – there are more than one, more than a few, maybe a large number of devices which can perhaps handle the very same event, then we get a grip on certain important problems. For one, we come to see another way that the operation of relevance rules which provide for the use of *a* device, perhaps *a* device exclusively, is fundamental to maintaining what in its way is a very queer fact; that is, the in-principle intelligibility of events for Members.

Now this matter of intelligibility is most extraordinary, and I will go on to suggest how the exclusive relevance of a device can guarantee in-principle intelligibility. But I want to pause to consider how interesting a fact that is. It seems that it might be on the one hand a kind of cultural universal – I don't know of an ethnography that reports of a culture that has Members claiming that they really have no idea of how pretty much anything works for them in their world. And this kind of universality seems to permit a formulation of problems of knowledge, even of science, according to a famous metaphor used by Otto Neurath, who was a philosopher-scientist a while ago; something like, 'In rebuilding science' (and in rebuilding knowledge I suppose the same would hold) 'we're like persons on a boat who have to rebuild it plank by plank while staying afloat.' Now that sounds as though you could sink. But what may be more important than that possibility is the fact that intelligibility is retained over all changes in whatever it is that's known. And what might be involved in that is the fact that there's some form to intelligibility, which any particular shift in knowledge doesn't modify.

If, say, for some culture, for some given problem a particular membership device is relevant for deciding causality, then the fact of a solution is guaranteed in principle for almost any culture in which that is found. That is so by virtue of the fact that the incumbents of a set of categories are finite, known, and countable. And the task, then, of coming up with an account, an explanation, causal attribution, is one of going to a finite list. That some natives have such a procedure is then, for them, a way of guaranteeing results. And in more than a few cultures where, for example, as anthropologists put it, death is not purely a natural, but also a moral phenomenon, always having persons who cause it, when somebody dies there is a procedure of going through a list to find out 'Who?' And in that way one could see what, in part,

might be involved in not giving up the notion that what we call the purely natural world, controlled by whatever it's controlled by, is to be seen as causally handleable in just the way any moral events are causally handleable.

This fact of intelligibility can be gotten at in another way. One could imagine that the birth of science would take place by somebody proposing something as the truth, which persons simply didn't know about before – a fact they hadn't noticed, or whatever. And yet it happens to be the case, for the more or less well-attested beginnings, that pretty much each of the fragments of early Greek science begins in essentially the same way. And that is with an assertion that 'Everybody thinks they understand the world but they're all in error.' Now that's kind of queer. If, however, it can be taken to be so – that that's the way beginnings take place – then you might well find it useful to suppose 'intelligibility,' and ask, 'What are the ways that intelligibility is done?' If, for example, person categories are always involved in intelligibility – at least for some considerable while – there might be some possibility of a general attack on that problem by reference to the question, 'What is it about person categories in general that makes for their use to provide intelligibilty?' As I mentioned earlier, one issue involved in that may well be the fact that for almost every culture except very modern ones, everybody is known in the first instance, and one is dealing, then, with a finite list which you need only go through to arrive at a solution.

Now the problem of relevance rules for given devices in a place where there are a lot of devices can, I suppose, be extremely illuminating. For example, in this therapy session, when this new entrant is told "He's not at all like Ken. He's more like Al and I," the fact that that could be done for him could be enormous news, in that it's at least possible that on that occurrence, or when it's been done a series of times more, he might come to think something like, 'Gee, maybe I can be like Al and he. I always thought I was like my Uncle Harry, who's a bum. That's what they always told me.' That is, he might have been led to suppose that it's his fate to have, as possible persons to be compared with, some perhaps not extremely limited number of persons, but persons formulated from very particular sets of alternatives.

Persons take that to be the case in our world, very much. And social scientists do, too. So, for example, it's considered a large important development that some Negroes get into high positions, so as to provide for others to see the possibility that they, too, can make it – where occupational movement is taken as something for which comparisons are to be made within such a category. As compared to, for example, a very current illustration of that: Almost every article on the promotion of Bill Russell to coach of the Celtics talked about 'the first Negro . . . etc.' The *Los Angeles Times*' sports columnist, who's a great humorist, talked about everything else *but*. That he was the first person over 6'10" ever to be made coach of any professional team, the first person who owned a plantation in Africa to be . . . etc., where the humor in it turns on the fact of the obvious and exclusive relevance of his race to that position, and to accounting for it and formulating it.

The possibility of 'other models' is not much treated, but if it were the case that one could simply propose that Negroes could consider, for formulating their chances, what Jews have accomplished, then there might be an enormous increase in their feelings of chances of success – in certain areas, anyway, i.e., other than rabbi.

The problem is, of course, psychiatrically very important, since routinely patients will take it that their fates are provided for by what has happened in their family. Now how you go about opening those relevancies up is something about which I have no idea. But, that they *are* openable up is guaranteed by the fact that any such set of categories do the same work. That is to say, you could perfectly well say "He smokes like me," i.e., he smokes like me-another-patient-here, where that device will bear that use – a comparison for smoking. And of course, "you smoke like your older brother," etc. It's a question of what it is that a given device can't bear for comparison, and, for that matter, for causal efficaciousness. It may well be extremely limited. And it may, in any event be, insofar as it's limited by reasonableness, only conventional in the usual sense of 'conventional.' All of it involves employing those notions of intelligibility that are enforced. And the enforcement of relevance rules has at least as one of its imports that the finiteness of a problem is retained, since so soon as any and all devices will do, there aren't, perhaps, certain procedures to employ. And the search procedures seem overwhelmingly to be tied to the use of single devices.

In considering these issues of intelligibility, one has to take almost all social sciences to be part of the same operation, since, again, almost all of it involves using one or another of the devices as a way of formulating its account. And there you may get conflicts about devices: Voting is either tied to income or religion, possibly in some way to both. But it is those social structures that they take it that Members know about and use, etc., etc. So that it's in that sense, working within what is in-principle intelligible, where the issue is only 'Which?,' that constitutes the basic way that the social sciences proceed. That is, in a way that is not, in principle, different from a way an Azande decides who it is that is causing him trouble, or killed his brother.[3]

In that regard, then, the fear of the boat sinking may involve retaining the character of the problem, which had one seeing oneself replacing a plank with another plank, and not, for example, mixing your metaphors while afloat, and seeing what that does.

Now, when we return to our data, the set of remarks like "He smokes like me," "he's more like Al and I," can be seen as introducing this fellow to the viability of the new environment. It's an adequate environment for comparing, attributing causes, etc. And the question of its adequacy may have nothing to do with its size, but only, for example, with the fact that its device is complete, i.e., that it provides for the fact that whomsoever comes in, is formulatable as a member of one or another of whatever categories it contains.

[3] For a consideration of the Azande decision-making procedure, see Fall 1964– Spring 1965, lecture 5, pp. 34–5.

If that is so, then we can see what the considerable importance is of the fact that his being there be understandable to them, such that they seek to find it out, and to see that he has been dropped into this environment by some reproducible procedure. To 'be in here' and 'belong in here' are equivalent for them. And that may set one constraint on the use of some device, i.e., that it provide for a recognizably intelligible environment; that everyone who is here belongs here.

Then there are issues like the fact that when an anthropologist goes somewhere, what they want to do with him is to make him one or another form of Member, which is among the most routinely reported occurrences within the literature. Strangers are objects of fear.

Lecture 29

Place references; Weak and safe compliments

Ken :   Did Louise call or anything this morning?
Ther : Why, did you expect her to call?
Ken :   No. I was just kind of hoping that she might be able to figure out some way of coming to the meetings. She did seem like she wanted to come back.
Ther : Do you miss her?
Ken :   Oh, in some ways, yes. It was nice having the opposite sex in the room, ya know, having a chick in the room.
Roger : ((sarcastically)) Wasn't it nice?
Ken :   In some ways it was   I really can't say why, but it was.

I'll be considering this piece of data, in connection with a statement, "Usually there's a broad in here," which occurs on the fifth page of the data handout, at the very bottom. What I wanted to point out about it I'll hold off for a little, while I notice some other things in it which are kind of interesting and I think could get some attention.

For one, it's part of a fairly general use that we find the term 'here,' and it is quite interesting in its way. In the first instance, one might take it to be strictly a place term. But it's quite regularly used in a much more powerful way than that. Consider, for example, "you must be crazy or you wouldn't be here," and there are a bunch of others in the data handout.[1]

Now it's clear enough that it is not just doing place reference. Consider as an alternative, for example, "Usually there's a table here." Where that might be read to be saying something like, 'Pretty much any time you might come, you would find a table in this room.' I take it no such sense would be given to "Usually there's a broad in here." And of course, furthermore, I take it that 'a broad' means the same one, but that 'here' means at least 'here and now,' 'here when we're here.' So it captures time, also, to some extent. And it does more than that. It seems, in the case of "Usually there's a broad in here" that

---

[1] Oddly enough, just the use that Sacks is discussing here may be occurring in this stretch of talk. The transcription shown is Sacks' (from a session that occurs a few weeks after the one which has so far been considered). And it shows, "It was nice having the opposite sex in the room, ya know, having a chick *in the room*." A later version shows, "It's– it was uh nice having– having the opposite sex in– in the room, you know, havin' a chick *in here*" (emphasis added).

461

there is furthermore involved that she is one who belongs to the group: 'Here, now, with us, as one of us.'

There's another place, which isn't in the data handout, where this fellow, Ken, is talking about the military school he goes to. He's an officer there, and he's talking about how well he gets along with the people under him, and how he's very popular, etc. At which point one of the others says to him, "What are you doing in here?"

In "you must be crazy or you wouldn't be here," just the same sort of use is involved. Again, it would seem to be concerned with 'here when we're here' and 'here as one of us.' Where, for example, that statement would not be made to the therapist or to any other visitor, but 'here' may be bearing some activity use, or membership use, or both, as well as what is, I suppose, in its way quite incidental, and that is the place term.

I haven't talked about place terms at all, but there is some extent of use of place terms where the activity being done at that place is, for one or another reasons, not mentioned. So, for example, people will say "I'm going to the bathroom," where the place reference serves to indicate in one or another way, and not name, the activity or class of activities that are to be done, that are done there. The same is done with, for example, the phrase 'going to bed,' invitationally and in other ways. And it's not, in those cases a matter of, for example, an unclarity involved, i.e., it does not involve it being unclear to some extent, what's being done at that place, though the name of the activity is not used. And there are other occasions in which place reference is used where, that one is going to that place is among the more incidental things involved; what is important is what it is one is going to do there. And it is, of course, the case that regularly one can say one is going to the place when one is doing the activity or reporting that another does the activity, and you don't have to do it in that place, or know that the other is doing it in that place. That is, if you say somebody 'goes to bed with' somebody, you don't know, perhaps, that what you're reporting they do, they do in bed. Sometimes you can use a substitute activity, "She sleeps with him," where 'sleeping' would be among the more indefinite things that you're reporting, and may not even be known to you to be the case. Now what's involved in those, I don't know; why those places are picked out, I don't know, but it's something that one might give some attention to.

Earlier I mentioned that the therapist–patient collection of categories seemed to have a kind of omni-relevance to them, and one of the things I wanted to watch for were the ways that that collection might be used in the session, without other special introduction, to provide the sense of the interaction. And I take it that, for example, "you must be crazy or you wouldn't be here" has part of its sense in that way, i.e., 'you must be crazy or you wouldn't be here as a patient.' Where the sense of it would have to involve some way in which those categories were seen as available without other specification of them. And what we get to is a way that various of the statements are contexted, somewhat without the relevance of what has happened before, but by virtue of the sort of activity that goes on 'here,' and

the sort of people they are by reference to being 'here.'

So that, for example, the terms 'usually' and 'here' do what they do, and do it very clearly, without any need to reintroduce 'patient–therapist' and the variety of other things involved, such that 'usually' can be seen to talk to the fact of 'when we meet.' That is to say, 'She's here at most sessions.' 'Usually' refers, then, to the sessions, and is some way of reporting on comparative presence. But it has quite a different sense than it would if we had simply the statement which was tied to 'here' as a place, like "Usually there's a table here," where you might imagine that any time you came in, you would find that table, unless it was moved. It has nothing to do with what we do here, or that one has to arrive around the time of our sessions to find it. It might be very clearly the case that 'usually' and 'here' would have that use if we had a membership term directly referred to, i.e., "Usually there's a psychiatrist here" would, perhaps, serve quite clearly to give 'usually' and 'here' their special locus as referring to the place where we have our meetings, and when we have our meetings.

The question of how those terms otherwise get their transparency is one that I take it would have to be resolved by reference to the general availability of the alternation 'patient–therapist.' But how it gets brought to use, to understand or clearly produce any given statement, is quite another question, and one I can't deal with. But in any event, one can see that 'usually,' and whatever terms it will have as substitutes –'occasionally,' 'sometimes,' etc. – can be treated as a set of terms that can be applied to any or some recurrent events or class of recurrent events, where the term refers to whatever properties those events have. So that, for example, if it prefaces a statement like "Ron Fairly bats third," that means 'when the Dodgers play,' 'for each game,' etc.

That term, then, has its character as part of a set of terms, where the unit that they're used with respect to tells you what kind of thing they're doing. Where that may involve that if you get 'usually,' 'sometimes,' and the like, in a use which is possibly dealing with some recurrent activity, then you're to hear it with respect to that given unit, i.e., a 'session,' a 'game,' etc. And that would mean that one would have to have specified what it is that they are overall doing, to get what it is that they 'usually' do.

Now it's clear enough that 'here' alone won't do the reference to time and place and sessions, and 'usually' won't do it, either. Then we have some sort of puzzle as to how the whole statement gets it, where these very general, abstract cases of terms from sets of terms – 'usually,' 'sometimes,' etc., 'here,' 'there,' etc. – lock in to have a perfectly transparent sense. And 'a broad,' itself, has to be interpreted, to get 'a broad who is a member of our group,' and not, for example, the wife of the therapist, or whatever else. If 'here' gives us the relevance of 'patient–therapist,' and then one tries to find, well, which one would she be, patient or therapist, and had some way of saying, not therapist, then patient, such that one got "usually there's another patient here," one might then find 'usually' and 'here' to be 'when we meet.' It's enormously compact, then.

Now what I wanted to do was to consider some of the ways in which the formulation of the absent person as a 'broad' – or female – was relevant to what it is that's being done with that formulation. I wanted to start with that sequence I began off with, and I wanted to develop what seems to be a way of making a compliment of a special sort: One that's weak, and safe. And if we can initially take it that saying that you miss somebody is a way of offering a compliment about them, then we might try to see what ways there are of doing that in this special way – weak and safe.

That formulation of her, "It was nice to have a member of the opposite sex in the room" is produced as an answer to "Do you miss her?," where that could, of course, be answered by a lot of other things, equally compliments: "She was very witty," "She was very bright," "She was very lovely," whatever else. But "she was a member of the opposite sex" is kind of a special one. Its specialness is somewhat related to the developments that take place from "Usually there's a broad in here;" when that gets picked up again on the eighth page of the data handout, several of them say "She unites us." We have a situation where, by saying 'it was nice having a member of the opposite sex in the room,' a device is invoked which has two categories, 'male' 'female,' and for which, in this place, there are a variety of facts that hold:

First, the person being referred to is the only member of the category being used, i.e., 'female.' And then, that category is being pointed to as what's 'nice.' Now that's a good way to make it weak, in that no comparisons are involved with other members of the group. If one says 'she was very bright,' another could say 'Well what about me?' No such thing is involved. So that one is not, by making the compliment, setting up the possibility of comparisons, which would perhaps negatively characterize other persons present. Where, given the characterization of a member, one regularly goes through the population to see how each of the others stand on the very thing used. In this case, she's the only one.

Another of the ways that the compliment is weak turns on the fact that formulating her presence by reference to that category involves proposing a criterion for her replacement. Whomsoever would satisfy that, might well satisfy the missing-ness of her. It's not a 'personal' loss, it's a categorial loss.

And, of course, to formulate that 'I miss her' by reference to the male-female alternative can have another way in which it's quite trivial, in that, that device having only two categories in its collection, completeness would be found by virtue of some member of each category being present. One category not having members present, a member of it could be said to be 'absent,' and the group incomplete. One could propose that to be so even if it weren't the case that she was in the first instance there at some other time. That is, insofar as one could find the relevance of the device, one could propose that 'we lack a woman' by virtue of the fact that we're all men. The group is, then, incomplete in a readily formulable way.

In the case at hand, we have the additional property of safeness, by virtue of the following. First, the device has only two categories, and they are all members of the alternative one. And then, the two categories are such that

any member of one can say of any – known or unknown – member of the other, that it would be nice to have one around. In that case, one is not merely missing her as a representative of a category of which she's a member, but one is speaking as a representative of the category one is a member of. And as such, any one of them could have said the same thing. It involves, then, no special commitment on his part, to some position vis-à-vis her, or vis-à-vis females, but he's invoking some well-formed relationship between men and women.

That there is such a well-formed relationship which permits him to be talking representatively, would differentiate, say, that 'missing' from other missings from categories which don't have it between them. If, for example, the non-present person was, say, Negro, or Mexican, or whatever, and this fellow then said (again, making the split in which they're all in an alternative category), "It's nice to have a Negro in the room," it could well be argued that he was taking a stand which others need not. It is not that for any white person it would be the case that such a statement is properly makeable, or for that matter, that any member of the opposite side could say the same about you, as a member of your category. In this case he needn't even be a male to have made that form of statement. Had the group been all females except for one male, and that one left, any woman could have said exactly the same. It's via that sort of consideration that the enormous blandness of his remark is to be found. He is by no means going out on a limb.

In that regard, the remark "She unites us" has an equally trivial character. That is, by reference to her presence we all become relevantly male. And again, the notion of the completeness of the group need not involve a commitment to the special characteristics of this girl. If she's missing, she can be replaced. In that way, the kind of threat she can pose, the kind of harm she can do, by not coming, are given a rather restricted formulation.

When one wants, for example, to indicate to an other who can be handled via such a device but for whom special properties are said to hold, that they don't hold, one does it that way. That is to say, between husband and wife there's supposed to be one proper member – one proper member, indeed, for all time. However, it could be formulated via male–female, that each one ought to have the other. And when things get touchy, or for humor, when one says "What'll you do when I leave?," the other can say "Find another" as the answer. The ways that one shows that there's something special going on is to introduce a set of features beyond that categorial membership, to restrict replaceability and to provide, then, for a set of ways that one can distinctively assert that they would be missing, and at the same time to formulate what it is that's nice about them. That's a 'personal relationship.'

Now the question of what's being done via the introduction of "Usually there's a broad in here" might be considered. So far, the fellow is supposed to be 'company.' One has the sense that it's a kind of invitation, or pre-invitation, to return, with something offered as what it is that's to be gotten. Something missing now, likely to be here again, things are better, then, i.e., providing for the recurrence of these sessions. It's very quickly

followed by an explicit (but little bit odd) invitation, and that is, "Wanna join our amy?" But until then, I don't think any such usage has occurred, except for the one that almost begins the segment off, i.e., "We were in an automobile discussion," which is, as I mentioned (at great length), undercut as an invitation.

And the formulation of accounts of current troubles by way of relevant incompleteness is an extremely generic thing to do. When they later say 'this is an abnormal session because the broad's not here,' they are using a general form, 'I'm having troubles because of the absence of something,' which is extremely widely used. And it is often used with what might seem to be as little evidence, and in as ad hoc a manner as here, where, as I remarked earlier, we would take it that it's an "abnormal session" because of his presence and not her absence.

Lecture 30
Various methodological issues

I haven't given an occasion for tearing down in a while, so after I make a few remarks I'll open the floor to questions, arguments, or whatever. What I want to point up are some facts which I've mentioned before, but the import of which may not have been apparent.

I've mentioned that someone can say 'We do X' when they do not say 'I do X,' or when they specifically say 'I don't do X.' For example, on the first page of the data handout we have A1 talking about "we get tickets" and then he says that he has never gotten a ticket.

> *Al:*   We do race but the times we do get tickets are the only times when we maybe goin' a long distance, uhh I dunno, 1 – depends on how many accidents you have, and how many of these tickets you get.
>
> *Roger:* I have got a speeding ticket on the average of one every three and a half months. Since I've been driving.
>
> *A1:*   I haven't – I have never gotten a ticket.

Alternatively, someone can say 'I don't do X' when, under some formulation, they *do* do X, or they're doing it while they're saying they don't do it. For example, a bit later in the session, Roger, who has been smoking a cigar, says "I don't smoke." Furthermore, there are some circumstances under which if A does something, B can say 'We did that thing,' where presumably B couldn't say 'I did that thing' – though perhaps he could.

Such sorts of situations have, as one aspect of their consequences, some troubles they pose for observational sociology or anthropology, and of course for informant-based sociology and anthropology. Such sorts of disciplines are largely composed of writings which consist of narratives, or more formalized statements which are composed of activities plus doers under some formulation of both. Even if you're not going to go out into some field and do such work, the questions I'll be dealing with are relevant to reading those things and seeing what they're about, in what sense they're correct, and the like.

Now I say of course there's a problem for the informant-based disciplines, but leaving them aside for a moment, there's a problem for observational disciplines, of the following sort: Suppose you're an anthropologist or sociologist standing somewhere. You see somebody do some action, and you see it to be some activity. How can you go about formulating who is it that did it, for the purposes of your report? Can you use at least what you might take to be the most conservative formulation – his name? Knowing, of course,

467

that any category you choose would have the kinds of systematic problems involved that I've considered before, i.e., how would you go about selecting a given category from the set that would equally well characterize or identify that person at hand? How, for example, would you write up a report on the set of questions in the group therapy data? Would you simply say "The old members asked these questions to the new member"? How would you go about deciding that you could count across persons, for saying that the two guys asked ten questions, rather than saying one guy asked eight and the other guy asked two; or formulate some category for handling them? Is it anything that could be counted? Does it require that *they* count it? And must we, or can we, use the count that they use?

Is it always the case that the category of actor that you're going to use to write up who did the thing will at least be one that that person is a member of? Or is it possible that one could have a situation where the category of actor is a category of which the person who did the action that you're reporting is *not* a member, so that 'who did it' would not involve reference to that one? In certain sorts of religious circumstances for various cultures, persons are said to be 'spoken through' by the gods, by their ancestors, etc. Or they may conceive themselves to be actors in the sense that a stage actor is an actor, or in a sense close to that: Doing on behalf of someone who's not present, not alive, not human, but who would be said to be, perhaps, 'the doer.'

The problem of strategy in that regard may not be readily handleable by taking the best notes possible at the time and making your decisions afterwards. For one, there is an issue of when it is for the Members that it turns out that they know who did the thing. So, for example, in the ten-question situation, if that was being written up in a fairly conventional way – not doing a presentation of the record and some kind of analysis off of it, but a description that stands instead of a presentation of the record – would you await the fact that it happened to be the case that after the tenth question somebody says "We're doing better than he is," therefore allowing you, by reference to that statement, to see the others as having been done by both? And if you do that, then there are some special kinds of things that are involved. For you would seemingly be employing a notion that some of the things that persons do are somehow talking about their world, so to speak. That is, that they are 'metastatements;' statements that can literally be seen as 'about' something that preceded them, or which follows them, rather than being another in a string, having just the status that the prior ones had. That is, where one would find it, perhaps in principle, not so obvious how you could say that the statement "We're doing better than he is," which uses 'we' to characterize the past ten questions, is evidence for your view that those ten questions are properly reported as having been done by that 'we.'

If you find that hard to follow, just consider, for example, the following phenomenon. At the beginning of Gide's novel *The Counterfeiters*, the hero is looking at some letters which he shouldn't have been looking at, and then he says something like, "Now a step in the passageway should come," in which what he's doing is saying something like 'Were this a play, then at this point

I ought to be caught.' And one might say that the character in a novel is talking to us out of the novel, about a situation in which, if this were a play or a novel, such and such would be the case. But it is a novel, so it couldn't be doing that.

And of course, the statement is another statement in their world, and so it's not easy to see how they could be talking out of it, i.e., provide a special status to that particular statement which gives it a possible use for interpreting the prior remarks. Any such attempt seems to be seeking a way to say as true – or say as false, for that matter – something that the natives say. That is, to say that some things that the natives say are about their world in the sense that *you* intend to say is 'about their world,' i.e., controlled by considerations other than those which govern whatever activities they otherwise do. Another way we might put it: There would be some statements that they make, which analyze other statements and are not themselves things that we analyze.

Now the question is, how do you go about doing an observational anthropology or sociology? And what place would narratives of various activities, ceremonies, etc., have? And what place would statements in which Members' categories are attached to Members' categories of actions have? At the present time, pretty much any report you look at consists, itself, of statements in which Members' categories of actors and Members' categories of actions are paired in one or another way. And the question is, can we say more about those than that they are possibly grammatical statements in the natives' language, or translations of grammatical statements in the natives' language? Or is that the most to be hoped from them?

One possibility might be something like the following. Suppose you had a film of some scene in which the natives are doing whatever they're doing, and you pick, to start out, some scene that has as what's taking place in it, some set of events that the natives take it are describable – where they have a notion of description, and the notion of description holds for that set of events. Now, at least, say, in our world, the USA, there are events which are describable, reproducibly. The most prominent examples are games. Then what you might do is construct a piece of machinery that will generate descriptions, given those scenes. Where what you want is to generate descriptions that Members will say are grammatical, correct, etc. That having been accomplished, you might proceed to analyze those descriptions, in ways akin to or different from the ways I've been trying to analyze these conversations.

As members of this society, you can routinely write descriptions of all sorts of events. You might, then, write yourself a bunch, where you also have a film or a tape, then sit down and try to see how is it that you build those, i.e., try to reproduce your descriptions. If you do that, you ought to get an apparatus which would be, in part, an analysis of some culture.

The problem, then, is tremendously thorny. And I'll leave it at that.

Q: How would we keep from falling into the trap of subjectivity in attempting to describe events?

HS: I guess I don't see why it isn't perfectly possible to construct reproducible descriptions of whatever it is that we happen to have, as data, so

long as what we have as data is what it is that's happened – tapes, film, or whatever else.

Q: But now can we ever know what categories *these* people, if they were asked, would assign, i.e., those who have been recorded?

HS: In that sense, who cares what they would say?

Q: If one doesn't care, what is the value of assembling the data?

HS: Because we'll build the analysis of it, set up our –

Q: *We'll* build it. Will it ever have any possible relevance to the people who were involved in producing it?

HS: It needn't have any relevance. There's no criteria –

Q: You have no feeling that it would be desirable that it have relevance to the people that we are studying?

HS: That's another question.

Q: Well, I think that was the one question. Is there –

HS: No, the issue of relevance to their lives is another question altogether. I take it that there's an enormous amount of studies that are not intended to be relevant. For example, studies of how cancer does cancer is not intended to build better cancer. And there are all kinds of studies directed to what other animals do, in which we're not intending to improve them. We're not intending to improve, say, the course of the planets or the lives of those plants or diseases under study. Though it may well be that things can be done if you have some idea of what you want to do – that's never been a criterion of success.

Q: Well, then what in your opinion is a criterion of success with relevance to the apparatus that we're trying to construct?

HS: That it works.

Q: That it works for *us*. The particular person who constructs it. But to ten other people who get to view it, it doesn't mean the same –

HS: No, it can work for ten other people, also. That's a basic part of the routine criteria.

Q: Well then does it have relevance whether or not they understand it?

HS: Relevance? They could understand it without it having relevance to other than their professional lives. If someone gives you a logical proof, and other people can read it and see that it's okay so far as they can tell, it doesn't mean that they go out feeling that they've improved their lives, or improved the lives of the persons whose lives they're studying.

Q: But in most cases would not there be any underlying reason of whatever importance, that would cause them to study these reports, and that it would have some kind of relevance to the –

H: Well that could be a sociological problem, as to why they study those things, but I'm not about to suppose the answer to it, as though it were easier to ask why scientists do science than to ask why Members do whatever else they do.

Now there's a tremendous notion that people have, that the easy questions are questions like why the history of science is as it is, when they can't *begin* – for example, people can say "Nobody will ever figure out why humans do the

simplest things they do'' but anybody can say why scientists do what they do. Now I find that strange. I would take it that if you say that we don't know why anybody does what they do, then at least you ought to say "I don't know why anybody does science." If we can say why anybody does what they do, we may also eventually be able to say why they do science. But the latter is hardly the first question that could be answered. And any serious attack on it requires a serious study of things that are at least simpler than that – if that's complicated. Though if you could propose a very good analysis of why humans do science, that would be tremendously interesting. It would be among the first important pieces of sociology or anthropology. It's not a universal, don't forget. Science is not done by everybody, everywhere.

Q: Could you be a little more specific about what you mean by machinery?

HS: Well I've tried to give plenty of instances of what I have in mind. I've tried to put together pieces of machinery. Is it unclear at all that some of the pieces of analysis look like they might do the job of giving us some of those things? That is, we have some events, we try to find what kind of activity is going on, we then try to build a way of reproducing that activity. That's what I mean by machinery. A machine doesn't have to be a physical thing that I roll out here.

Q: It seems that you were discussing the fact that we were constructing machinery which would reproduce the natives' description of the activity, and then do the same thing for our own culture's activity. And then it seemed that you were intimating that possibly to create an authoritative and correct definition of what the natives are doing, we have to compare those two pieces of machinery to see whether or not they are similar enough to explain the natives' event in our terms or our event in their terms.

HS: No. I was just talking about *our* culture being the subject-matter in the first instance. What I meant is, we try to do it for them, we try to do it for us. Then we try to analyze both of them as *both* giving us different and intendedly compatible results from different cultures. Since we can read out descriptions pretty easily, for our own world, that might give us a beginning as to a set of things we could study to see how descriptions are done.

Now there's real problems with that. For one, there are lots of things which do not have the kind of describability for Members that, let's say, games do. And there are all kinds of things about which Members say, 'They're not describable.' Now what you do with them, I don't know, insofar as you wanted to start out with the scene and the description of it. Of course you might try to figure out what, when the natives say something's not describable, they're saying. But I wasn't intending a contrast of the sort you described.

Q: Supposing you had many sets of narratives from the same culture, and you're looking for a special thing; you're looking for maybe how attitudes towards authority develop. Can you do that? Can you go right into a conversation and look for something? Or do you have to look at the conversation first, and then try to decide what it is you've got?

HS: Yes. The first rule is to learn to be interested in what it is you've got. I take it that what you want to do is pose those problem that the data bears.

Q: Supposing you're actually looking for something. Maybe you can see something that you didn't know was there, just by –

HS: Well that's a personal problem.

Q: Do you think it's valid? Is it a valid way of doing it?

HS: My answer is a personal answer. You only can know what it is that a problem is when you dig it out of the data. The notion that you know that there's a problem called 'attitudes toward authority' involves you then in just asserting that notion, using the data as evidence. And you just don't want to use data as evidence. It ought to be perfectly okay with you whatever way it comes out. And if you're interested in a given problem you're not going to have that view, and you'll find yourself defending theses. It ought never to be a matter of concern to anybody who's doing a piece of description which way it comes out, as long as it comes out some way. Since all paths are equivalent, more or less. The world is one way or another way. So what. The question is, how is it? Since you're going to be wrong almost all the time in your analyses, anyway, you might as well not undercut yourself even further by starting out with some problem that you don't even know *is* a problem, or a problem for that data.

Q: ((Untranscribed, re kids' vocabularies))

HS: The best collection of data that I know of is Roger Brown at Harvard is collecting an hour of conversation per week between a pair of kids, maybe three or four years old now, from the time they were two. You might be able to go through that sort of stuff and see what happens to the kids. Even reading it is an overwhelming task. I have six months of it.

One has to have some notion of, given the time in which you're trying to do a task, the time you live, then what sort of task you can handle. And it would be nice if things were ripe so that any question you wanted to ask, you could ask. But there are all sorts of problems that we know in the history of any field that can't be asked at a given time. They don't have the technology, they don't have the conceptual apparatus, etc. We just have to live with that, and find what we can ask and what we can handle. Now it may be that if you really are hot about some topic, you can build a technology that would permit you to do it. But ways of processing language are in extremely bad shape, and that would be what you would need, I take it, to handle anything like that. For a *kid*. A kid's talk, over six months, is an enormous corpus; something that you might not readily read through in a very large time.

Q: ((Untranscribed, re finding 'average' behaviors))

HS: I take it I want to handle each item for itself. If I can handle each item, then I can't be too far bad. 'Average,' then, involves some kind of notion of how you could mesh a bunch of things together, which would involve, then, a notion of various of their properties that are essential or inessential, which would involve a notion of that, in the first instance, which I don't have, and if you have, great.

Lecture 31
Games: Legal and illegal actions

This time we'll have another installment of this ancillary discussion of games. I'll start off with a quotation from a book entitled *Intellectual Growth in Young Children* by Susan Isaacs, page 105. This is about a child aged three years, ten months.

> On one occasion he and other children had made a 'ship' in the schoolroom, with an arrangement of tables and chairs. Phineas' part in this was comparatively a passive one, as he was but a 'passenger' on the ship, and was going on with his own pursuits on the voyage, sitting at a table and sewing a canvas bag. Miss D. was with him 'in the ship,' and all around them the crew and the captain carried on the business of the voyage. And when, presently, a new supply of thread was wanted, and Miss D. said to Phineas "Will you get it out of the drawer?" Phineas replied "I can't get out of the ship while it's going, can I?" and called out in a stentorian voice to the 'captain,' "Stop the ship, I want to get out." After some demur, the ship was brought into a 'landing stage' and Phineas got out, secured his thread, and got in again, saying "Now it can go again."

And here is another, similar piece of data from an unpublished book by Barker and Wright, similar to their *One Boy's Day*. This is a girl, a little under five years old.

> She looked up at me expectantly, anticipating that I would push her. I said firmly, "No. Put your knee in the wagon and you can push yourself." She sat for several seconds, obviously waiting for me to push her. She waited long enough to be certain I wasn't going to push. Then she got down, put one knee in the wagon and the other on the floor of the cement porch, getting ready to push herself. In order to encourage her I said "Come on." She didn't move. She looked straight ahead. She announced, "There's a car coming." Then she looked at me indignantly. She was seemingly disgusted that I couldn't see this car that she announced. An imaginary car was coming, and she had to wait for it to get out of the way.

Now what we want to do is consider those, and see what's up with them. We need a couple of facts about games – very simple facts about games, and facts that are not particular to particular games, but the presence of which

473

indicates that even if one doesn't have something that is a named game, game-play is being done, by virtue of the use of these facts. But we can start with with games, in general. What we want to notice is the following sort of relation obtaining:

For the things that can be done in games, and that, when done, can count (e.g., getting a base hit in baseball, throwing a strike, scoring a basket, and the like), they can be done rightly or wrongly, legally or illegally. And in games, if they're done illegally there's a certain very sharp alternation. And that is, if they're not done legally then they don't count. For perhaps any event that can count in a game, the legal–illegal alternation is relevant, and relevant in the way I've mentioned, i.e., unless legal, doesn't count.

So the first thing is this general relevance of legal–illegal. To have such a general relevance for a class of actions is perhaps at least partly special, i.e., we don't tend to think that every action otherwise has that sort of alternation relevant. And furthermore – and in a way much more important – even where that alternation is relevant, it doesn't seem generally to be the case that the consequence of illegal-wrong, is what it is in games. Indeed, that the consequence isn't of that character is of considerable importance for a variety of activities. So, for example, in learning to talk there may, for one, be a rather considerable time when one speaks poorly, doesn't produce grammatical sentences, correct pronunciation, and the rest, and none the less, what one is doing is not only understandable, but acceptable.

It is, by the way, of some relevance in considering what it is that are criteria for, say, knowing the language, that one consider that persons can, not simply produce grammatical sentences and do the various other tasks correctly, but that they also know what's correct or not. And it's kind of interesting to consider how early kids come to monitor others' speech with respect to the correctness of that speech. I have conversations taking place between a four-year-old girl and her brother who is a little under three, of the following sort. The two kids are in bed for the night, and they chat before they go to sleep. There's a tape recorder in the room, and it just catches what they do. One of the things I find on the tape is that the four-year-old is regularly engaged in giving lessons in English to her younger brother. He's at a point where he's engaged in talking to himself out loud, just saying words. So he says the word 'yellow,' and he says "yaller." He just says it, repeatedly. Then she comes along with an interruption which consists of "Not 'yaller,' 'yellow.' Say 'yellow'." He says "Yaller." "Say 'yellow'." And they go along, and there's some modification. And on some of the tapes she is engaged in giving definitions to him. He says "What's a such and such?" and she tells him what a such and such is.

Now, if we have to incorporate into our notion of possessing the language, not simply the ability to produce grammatical sentences, but the ability to teach that language, i.e., not simply such a knowledge as operates to generate correct sentences, but a knowledge which permits one to monitor sentences so as to see, for example, incorrect ones, and also, for that matter, to see what it is that the incorrect ones are a version of, so as to project what a correct version

of that incorrect one looks like, then that seems to involve a kind of image of a language user which is not exactly coordinate with some of the notions that have been offered as what a language user would consist of. So, for example, in some classical considerations of such a matter, it is proposed that 'a grammar is unconscious,' and that it would serve, when it's incorporated, simply to generate correct cases. Under that formulation you might well be able to generate correct cases and, for one, not understand at all incorrect cases – not even see what they are variants of – and furthermore, not be able – except by example – to teach the language. But if it's the case that persons *can* teach the language, then they may well have some way of attending the grammar that's built into them, seeing its properties, and using it to monitor the incorrect statements of others, seeing what they're about – and also to teach.

Insofar as kids learn that they can do 'speaking' and other things in such a way that what they have to attend to adequately (which may be 'adequacy for understanding') is something which is not quite the same as grammatical correctness, then they may have an image of the consequences of error which is not to be wholly generalized if they're to proceed successfully for other things as well. That is, there are matters for which, as we put it with respect to games, 'a miss is good as a mile.' If you touch an electric wire, even for only a second, less than a second, sufficient consequences may occur such that there are things you absolutely do not want to do, at all. And things you absolutely want to do perfectly, and not approximately.

Early on, I raised the question of how it is that kids are going to learn to orient properly to danger.[1] And we could see that they might, indeed, get into positions of danger so as to get the attention of other people, whose business it is to pull them out. It could, of course, be a very troublesome rule to learn. Now games are quite opposing sorts of matters. First of all there is the general relevance of legal–illegal, and the very sharp consequences attached to illegal: Doesn't count. Can't do it. 'Can't do it' meaning you can't accomplish the action you undertake if it's not done legally. The longest home run doesn't count if you don't touch the bases, etc.

Q: This applies to formal games like baseball, but it seems to me that according to your definition of last time, of games, that war could be considered a game. It's got teams, it's got rules, it's got all these things, and yet isn't that a case where this doesn't hold? Where sometimes the most illegal things are done and *do* count? Or were you speaking only about formal games that would have a name?

HS: Well, on the one hand, what the cases are in the classes I'm talking about, is not something that I'd lay down. So whether we want to consider war a game would turn on the question of having found such properties as hold for games, whether we find that war has them.

War is an extraordinarily interesting thing, and there are gamelike features of it which are quite un-understandable were you not to consider the features

---

[1] This may be referring to lecture 10, pp. 346–7.

of games. Be it as it may that there are things one does in war which are 'illegal' and yet count, you might well consider alternatively why it is that there are things that persons would seemingly do in war if wars were, as we might suppose they were, simply whatever it is you can get out of it you get out of it; if you win you win, that's it, which they *don't* do all the time. So there are circumstances in wars where rules are abided by which would seem in the short run, even in just that given war, to be very disadvantageous, and nonetheless they are complied with. And that's, I think, much more extraordinary than the fact that there are wars in which rules that may have been held are violated. For one, in *games* rules are violated. That's a shift in perspective on the matter, and I just suggest that this might be considered before saying that wars are an inconsistent case – and I propose that they are a case.

Leaving that consideration aside, there's a habit which I wanted to notice, which is very inconsistent with doing investigations pretty much of any sort.

Our aims, and the aims of researchers in general, are to try to get at sets of properties that something has, see how they work, etc. We're not, then, engaged in saying 'Is X a game or isn't it a game? Is Y a game? Yes? No? Now we have a list of games and that's our discovery.' What we want to do is to consider what makes something a game, and get at, then, these sets of properties. Something may well be partly a game, partly not a game. And the question is not, for example, that if you said that games can be played such that you can play catch with your dog, that you're wrong, but what does the fact that you can or can't play catch with your dog tell us about how games work, or what the members are of the class of games, and why. And the same would go for war. If one had some properties that discriminate games from something else, then the introduction of war is of interest. And one ought to be interested in that way.

Now it's perfectly well the case that in card games people violate the rules and get away with it. 'Getting away with it' is one sort of thing, and certainly I could not possibly be saying that people do not get away with violations in games. Just as there's a history of good play, there's a history of how to cheat. The phenomenon of cheating is not, however, something that undercuts the status of games as being things that have this character that if you do something illegal it doesn't count. Cheating is *directed* to that sort of fact.

So: I've said that there's an alternation, 'legal–illegal,' without specifying at all how it's used. And with that alternation, however it is that 'legal' or 'illegal' gets assigned to something, then there's another relation between that and 'counting' or 'not counting.' Now we're considering this issue of danger, and how it might be oriented to. Relatedly, there's a problem which I dealt with earlier, with respect to lies. I suggested that when it was the case that kids could make good descriptions to build good stories, then you could have a nice index of the fact that they know how to make lies, on those matters on which they can build stories. So one of the things we want to be looking for, also, is how we can tell that kids know that some event is a matter of danger. That's a thing which we would very much like to know, for a large range of

their activities, so as to know whether we have to worry, when they're doing something that may be dangerous, do they know it's dangerous or not.

We'll talk now only about those games that are called 'imitative games,' i.e., where kids simulate some real environment in their play; a real environment of adults, or of kids, or of both. In such imitative play they need some scope for picking out those things which are to be legal or illegal, and which, by virtue of being that, can or cannot be done. That is to say, they need some way of assigning to any possible action its status as legal or illegal, and therefore doable or not. And the question is, what aspects of those possible actions do they focus on to make that determination about an action?

So we have: [legal/counts] – [illegal/doesn't count]. Now, especially when you're engaged in imitative play, the possibilities that arise for doing various things may be quite unformulated – in a rule book or historically – such that the various participants may need some way of monitoring any given proposed activity so as to decide whether it's doable or not. Legal–illegal clearly would not suffice for deciding that, except for activities that were already done – or by some other criterion which was put into a strong relationship to legal–illegal. For example, 'safe–dangerous.'

It may be that participants could monitor any given proposed action within the play as to its status as safe–dangerous, and then tie that to the legal–illegal alternation. If safe, legal. If dangerous, illegal. Then, consequence: If dangerous, can't be done, and count.

Notice that in imitative play it perfectly well 'could be done.' That is to say, Phineas could, after all, have gotten out of his chair and walked over to the drawer without any trouble about drowning. But were he in a boat – which is what the game involves him in being – then the act of going across to shore would indeed be dangerous. And the same, of course, for the second story.

Q: It seems to be more – Instead of 'safe–dangerous,' 'impossible–possible.'

HS: Sure. There's a sense in which that's so, also. I've used that one, also. The question is, when you use one or another of those pairs – 'safe–dangerous' and 'possible–impossible,' the notion of 'possible' is one that may be somewhat more difficult that the notion of 'dangerous.' Let me try to give you a suggestion on the point. We'd say that Phineas would drown if he wanted to go ashore from a boat, and therefore going ashore is 'impossible' – if we could say that he had some fair idea about 'possible.' But the problem, in part, is that there are things that kids can acknowledge as 'dangerous,' where the consequences of the danger are not grasped in the way that, as adults, we would talk of it. In *Children Tell Stories*, for example, you'll find that events occur like the following: Daddy is doing something, he gets eaten by a lion, he's dead, he comes back. Now it's clear enough that something pretty awful has happened, but exactly how awful is not at all attended. Somebody is seen to have something terrible happen to them, they get burnt up in a fire, and the doctor comes and puts a Bandaid on their finger, and they're better.

It seems to be the case that they appreciate that it's dangerous, but that it's irreversible, for a whole series of things, is not seen. And also, the scope of the trouble is not seen. You will find regularly that they get injured in one or another ways that you would take to be enormously dramatic, and a Band-aid is put on, and that's that. Now the sheer fact of the Band-aid may tell us that they appreciate the fact that it's dangerous. But that it's impossible, in the sense of they're dead, and dead in the sense that we understand 'dead,' is not appreciated by kids for rather a while. So whether we can at this point say 'impossible,' always, is something I'm not really willing to claim. Though when it does hold, I take it that the same mapping holds.

What's especially nice is that there can then be a premium, in play with a set of persons, on the detection of events that are 'dangerous' in the real world; using them to point up the fact that some action that somebody proposes to do, can't be done, by virtue of the game features: legal–illegal, counts–doesn't count. And that can be done by participants to stop the action of others, or for a variety of other things. In the case of the second story, it is done as a way of putting down the adult who suggested such an action, i.e., that the adult ought to have known that there was a car coming. And the fact that what we would take to be a hostility generated by the adult's refusal to push the wagon was handled in that nice form, rather than the various ways such a hostility could have been presented, is, of course, worthy of consideration.

Lecture 32
Seeing an 'imitation'

Last time I made passing reference to 'imitative play,' and what I would like to do now is focus on the phenomenon of 'seeing an imitation.' Let's leave aside completely the theater; that's not what I want to be talking of. There are some ways in which the phenomenon of 'seeing an imitation' is of very large importance, and I'll bring that out, at least assertively. But I want first to point up what we're talking about.

If, for example, you see a rather young girl, three years old, perhaps older, behaving coquetishly, you may find that what you see is, her imitating a woman. And there are, of course, much larger collections of actions which one sees being done as imitations. One thing to notice is that you can see somebody doing an imitation although you've never seen that person before, or even if you've seen that person before, you're never seen them do that action. You don't see them doing the thing itself, you see them doing an imitation. And that raises some rather neat questions.

The matter is not restricted to young children. If you look especially at the pre-Civil War literature on slaves – and even, indeed, some current discussions, and certainly current lay talk on the matter – one gets something that can be summarized in the sentence, 'Negroes and children are great imitators.' There are some extraordinary things about that kind of an assertion, and, for one, it's perhaps related to a matter I mentioned some time ago, this thing of 'who owns reality' and what the import of owning it or not owning it is for some category of persons who are apparently not entitled to be seen to be doing some given action, which they technically are perfectly able to do. That is to say, the notion that, say, an adult Negro is a 'terrific imitator' is to say that what he's doing can hardly be distinguished from that thing which, if someone else were to be doing it, would be seen as the real thing. But he's not to get it seen as the real thing, but an imitation of it. Which is explained by the fact that he's very good at imitating.

Why should people be seen to be imitating? And not, now, for something where they do it badly, or the like. There are obviously a variety of things involved in seeing an imitation being done. For one, for example, when one sees an imitation, one apparently has an occasion for observing the technique with which some action is done, and considering the technique as to, for example, how close it looks to the ways of doing the activity that one does with that action. For example, making a request. Where there may be few occasions otherwise for observing the technique; one simply sees that somebody has done something. And of course adults with respect to children are constantly engaged in marveling at the technical proficiency of a young

child, without ever treating it that they're doing the thing that they're technically able to do.

Secondly, there is apparently a situation involving the incompetence of the doers to claim that they are performing the given action. Their relevant set of activities are seen, at best, as proffering such an action, where one can accept it if one pleases, or not – apart from whether it's done well. One might put it roughly that we had something of an inverse to category–bound activities, where there are some activities, otherwise doable by anybody, which for some category of persons are not doable by them, no matter how well they can 'pull it off.'

It turns out that such categories of persons, who can, in fact, often do the thing well, it being regularly seen as an imitation and therefore not the serious activity it might be, they develop related ways of proceeding with such activities, and we get a correlate to the fact that 'Negroes and children are great imitators,' which is 'Negroes and children are great mockers.' And what a 'mockery' is, is to do that thing which you would otherwise be seen as imitating, in such a fashion as to make it clear that you're not seriously doing it, but that you're competent at it – and, of course, treating it in a fairly negative way. Children mock their parents, lessers their betters, students their teachers, etc., when the given thing, were it to be done in an unmocked fashion, would be 'but an imitation.'

One of the things that is present with actions seen as imitated, is that one seeks to see where they got it from. So you could have people doing the following – I'll use an historical situation, it's more transparent, in a way: Suppose you have a situation of an adult Negro slave of the same age as his adult white master, who were brought up much together. The adult Negro slave does something, it's seen as an imitation, and it's explained by virtue of the fact that he learned it from the masters. How it is that his same-age master learned it is no issue. And of course routinely for children, one will explain some action seen as an imitation, by the fact that they learned it from such-and-such, where that the others also learned it from somewhere is no issue, either.

Imitation is apparently one special case where one is unsatisfied until one comes up with some 'how they got it' explanation, and that involves only finding someone who is entitled to do the thing, and for that someone who is entitled to do the thing it's quite irrelevant to seek to find how *they* came to do it.

In the case of children, the 'imitation' observation may be done at that point when the child is not a candidate for doing the activity that they've done. That would make it close to the situation of a slave, who would in principle not be a candidate for doing the activity they did. Such that if you have become, say, a candidate adult, it might well be that it would be no longer seen as 'imitation,' but as 'learning what an adult ought to be able to do.'

When one treats some activity that a non-candidate produces, i.e., something seen as an imitation, as a 'version' of the activity done by

somebody who is a Member in some sense, whose doing it is not seen as imitation, it is important to see that there is no question of treating the Members as otherwise setting a standard. The one that one copies it from can be pretty rotten at it, and nonetheless their thing is seen as quite adequate, and as defining yours as 'a version of it.'

One of the things that would of course mean is, if one had a transcript or a film and one saw some possible activity going on in it, then, as an outsider, one couldn't assert what was being done unless he was apprised of the fact that the person doing it was one who could be doing it. Otherwise it would be seen as an imitation.

And again, to do such activities mockingly, kiddingly, and the like, in play, is more or less explicitly to recognize that in doing them one is making no claim to doing them seriously.

What I've said so far means that when you see yourself seeing somebody doing an imitation, you could get a good sense of the ways that the categorizations you use will enormously control your perceptions of what's happening. You see right off, 'an imitation.' You see it even though you will say 'It's a beautiful job.' You'll see it even though you don't know the person who's doing it. And you'll be happy with an explanation that they learned it from their parents, though you've never seen their parents, though they may do it better than their parents. That means you're dealing with something quite powerful and orderly. If you don't see an imitation, a whole set of the questions you ask and find yourself able to solve, do not get raised at all. And indeed, would be quite irrelevant if they were raised, like, where they had acquired that habit might be askable and answerable, but it will be quite secondary and uninteresting; it's his.

And in that regard, one thing further about imitation is that no matter how many times one does the activity, no matter how well one does it, it's never a possession; it's always borrowed.

I don't think that the situation is much clarified by treating as prototypes those activities which are the special right of some people to do. For example, if you sign somebody else's name to a check, that's 'forgery' and perhaps not anything like 'imitation.' If you try to perform a marriage service, i.e., act as a priest or such a civil servant as can do it, that may be quite different than trying to be gracious and being seen as imitating your betters, rather than being seen as a gracious inferior, or gracious and thereby not inferior.

It's not a matter from which anthropologists, for one, are exempt, in that they will report, for example, things like the following. In an interesting though recurrently confusing (or confused, as you may like) paper by Ethel Albert called something like 'Logic and rhetoric among the Burundi,' she points out that Burundi are very big on very elaborate rhetorical techniques, for argument and other purposes, which the upper classes among them specialize in. If I recall correctly, when she considers the capacities of those who are not entitled to use these elaborate techniques, i.e., the lower classes, the peasants, remarking on the ability of some of them to do it, she treats it as an imitative matter. Though she also points out that even those who can

argue with considerable rhetorical skill, when arguing with upper-class persons, will be 'proper peasants' and argue very badly – though I suppose one could say then that they're imitating peasants.

As I've mentioned that article, I ought to note further about it (and it's about one of the only places I've seen it so far) she suggests that in apparently very routine conversations among the Burundi, when they are multi-party conversations, i.e., more than two persons, they have a formulated way of coming off. That is to say, there is a 'first speaker,' 'second speaker,' 'third speaker,' given by the social structure. And that order is supposed to recur throughout the conversations. The point is unclear, because she notices that if an elder, or 'proper first speaker,' at some point in the conversation refuses to talk, then the conversation stops. Now that makes it unclear as to whether the sequencing rules are the property of those people, or rules which they conform to as well, in that when they talk others follow in sequence and they may not interrupt. But if it were a rule that they all properly follow, then one might imagine that anybody could stop at their point, be silent, and the conversation ends. Or it would pause until they decide to speak.

But in any event, the phenomenon of a rule for sequencing without regard to the number of persons present, which not only controls first speech for each, but the sequence of later speech, is a matter of rather considerable interest.

It is also the case that members of some category that has its members seen as doing imitation when they do some activity, will see their peers as doing imitation when they do that activity well. And they put them down for it. So, field slaves are reported to have treated house slaves as 'putting on airs of the masters,' and 'thinking they're better than we are.' Which is to say, in part, that neither master nor field slaves were engaged in recognizing the possible assimilation of house slaves. For once they were assimilated, presumably one would no longer see that they were imitating; one would see them doing what such a person ought and can.

Lecture 33
On sampling and subjectivity

. . . there are others which turn on when it is and how it is we use a feel for what an explanation would look like, and invoke such conceptions to decide that we've got one. I'm not sure that I'll deal with them in such an order, but I'll try to deal with them to some extent.[1]

The *sampling* matter I think I at least mentioned, and have given some rather cursory remarks on, but I'll take it up again, now. Involved in it is the conception of the sorts of order there are in the phenomena we're investigating. Relatedly to that, there are the locuses of order.

Now the question of the sorts of order there are has been one of the basic problems out of which a social science could be said to have emerged – if it could be said to have emerged, or may eventually emerge – from those things which would historically be called philosophy, for one. And it seems to be the case that the important early models of the order in society were constructed in a hope of providing for their stability, where that stability was seen as something problematic, in a fairly special sense of 'problematic,' and that is, under a fear that it may break down, or it has broken down, or it's tenuous. Where people were concerned – say, Hobbes, for example, or Plato – that the world was falling apart and could be put together again if this or that were done.

I say that's a special conception of 'problematic' because it would be much more conventional – scientifically, anyway – to treat the problem of 'problematic' as one in which if something occurs, then one wants to know how. And if it falls apart, one wants to know how, and all of those are equally well facts to be examined, explained, whatever. And none of the facts, furthermore, is better than any other. That is to say, one doesn't care to find how something can be orderly which, under some formulation, can be not orderly. It's just as well if it falls aparts as if it doesn't.

Now, for whatever reasons there were, the social sciences tended to grow such that the important theories tended to have a view that if you look at a society as a piece of machinery, then what you want to consider is the following: There are relatively few orderly products of it. There is, then, a big concern for finding 'good problems;' that is, to find that data which is generated which *is* orderly, and then attempt to construct the machinery necessary to give you those results. So that, for example, one might fix on the fact that the rate of crime has a certain low status, or that the loan rate that

---

[1] The first few minutes of this lecture were not recorded. Apparently Sacks listed a couple of issues that he would talk to. The transcript begins in course.

banks employ is generalized and more or less stable, and then try to see how that happens.

One has a view, then, that one has to find some indices, and build an apparatus that would maintain the indices in whatever way they seem to stand – or fall. Where it's quite crucial to locate which are usable ones. And where you can get a picture of disorder which would involve, say, their rapid fluctuation.

That image, then, suggest that there are a few places in which, if you can find them, you will be able to attack the problem of order. If you don't find them, you won't. And much of what else takes place is more or less random. So you can have a picture of a machine with a couple of holes in the front. It spews out some nice stuff from those holes, and out of the back it spews out garbage.

Even when such a view is raised to the status of a possibly scientific one, it tends to be heavily controlled by its sources, which are things like 'a concern with political order and how that's maintained,' and an overriding interest in what are, in the first instance, known to be big issues to Members. And not that which is terribly mundane, occasional, local, and the like.

It's perfectly possible, at least theoretically, to treat such a formulation as historically adventitious; a mere fact, an accident of the history of the way persons came to think about social problems, and to either suppose, or discover, or propose to discover, that no such thing is present, but that wherever one happens to attack the phenomenon, one is going to find – some would say impose – detailed order.

That would have enormous consequences for what one intends to build. If you want to build the stability of a rate of conformity to law, or a bank rate, then you build large-scale, massive institutions as your image of how that thing could be done.

But if you figure, or guess, or decide that whatever the human does, it's just another animal after all, maybe more complicated than others but perhaps not noticeably so, then whatever humans do can be examined to discover some way they do it, and that way would be describable.

And furthermore, you might find that the fact of 'order at all points' could be used to explain what are otherwise fairly strange facts; things like the following. For one, certain kinds of researches – for example, let's say, taking very conventional sociology, survey research – would use the fact that it gets orderly results to indicate that it must be doing something decent. Now everybody knows – that is, everybody who has ever done such work, or studied it – that it's almost universally extremely bad; that almost never can whatever the constraints are that ought to be used under their own formulation to decide that they have something, be used. There are, for example, all kinds of constraints on proper statistical procedures which are never satisfied, and nonetheless they get order.

Now why should that be? It could be a real problem. Secondly, there are the anthropologists' procedures, which tend to involve a very occasional tapping in to a society, asking one or two people more or less extended

questions, which turn out often to be extremely generalizable. That, again, could be treated as a warrant for such procedures, or a tremendous puzzle.

Or it could be seen to be a consequence of the fact that it would be extremely hard, given the possible fact that there is overwhelming detailed order, to *not* find it, no matter how you look. And a consequence of the fact that that order is an important resource of a culture. Such that, for example, any Member encountering from his infancy a very small portion of it, and a random portion in a way (the parents he happens to have, the experiences he happens to have, the vocabulary that happens to be thrown at him in whatever sentences he happens to get) comes out in many ways pretty much like everybody else, and able to deal with pretty much anyone else.

Were it important for nature, in the way it would build culture, that if persons are to be workable things in a society they ought to have an adequate sampling setup, then it might well be so arranged. I suppose an alternative would be to make extremely simple kinds of environments which are massively reproduced, so that everyone faces more or less the same, and it doesn't matter which. And then, of course, research might employ the same resources: Tap in to whomsoever and you get pretty much the same things. If they're constructed in that way, then the fact that certain results are gotten from one informant would not necessarily be a warrant for those things being good procedures on their own terms, but evidence for an arrangement of the world which could be seen to be usable. And, again, in a great deal of the stuff I've been considering, I've been regularly pointing to the fact that people do it with persons they've never met, extend things to occasions they've never dealt with, etc., and do it with assurance and some success.

Now if one figures that that's the way things are to some extent, then it really wouldn't matter very much what it is you look at – if you look at it carefully enough. And you may well find that you got an enormous generalizability because things are so arranged that you *could* get them; given that for a Member encountering a very limited environment, he has to be able to do that, and things are so arranged as to permit him to.

So, for example, we might take it as a tremendous puzzle, how it is that Whorf, studying the language of the Navajo, talking to one Navajo in New York, could build a more or less decent grammar of it, and somebody else could do the same, about which we'd then say, 'Isn't that fantastic? What a genius he must have been.' But then we could say, well, how many people does any given Navajo encounter when he learns to do Navajo? Are they such geniuses?

We can then come to a view that while we might, under some conceptions, have the notion that a statistical procedure is safer than others, it may well be that we could give a formal account in the way of singular activities. And that would be a very important theoretical finding. That that could be done would tell us a great deal about the character of what we're dealing with – even if it wasn't enormously generalizable. That would just be a matter of how the ball happens to bounce, we'll see how generalizable it is, and, again, that tells us what kind of a phenomenon we're dealing with.

We could tie such alternative conceptions to various other alternative conceptions, like the kind of difference there might be between Catholicism and Protestantism, for example. That difference has been much pointed to, so that, for example, among the American theorists of social life, that one who gets the biggest play from Catholics is Parsons, with his conception of an enormous massive ordering of institutions necessary to account for even relatively minor matters. And some parts of the school of British anthropology which are like Parsons, are called Anglo-Catholic anthropology, where the notion of a massive institution, the Church, which guarantees certain kinds of order, is to be put into opposition to, say, that sort of church which supposes that everybody can pretty much handle it by themselves, and for which, say, large-scale rituals are not treated as crucial to stability in religion, or stability in other things.

In short, then, the problem of sampling is not separate from some possible large theoretical issues. And it isn't obvious that the problems that Fisher posed, and his solutions, are simply to be adopted (Fisher being an agronomist who was concerned to build some system of models that would permit him to decide various agricultural facts, and whose results were the considerable foundation for statistics in sociology). And it certainly isn't the only conception of the possible ways that order can be gotten at. And it's conservative, in a way, and weak. And there are perhaps much stronger available views, formulatable views. And certainly the line that I've been pursuing is one that at least is, in its attempted direction, seeking to see whether it would not be possible to formulate descriptions that are clean, and that deal with singular events. But it may not be possible, and the question is to see whether it is, and also to see what you have to do to see that.

Now, on the matter of *subjectivity*; of using a Member's knowledge and access. The issue has, by and large, never been one of not using it at all. And I could formulate the following kind of opposition. Reading with some care one of the most important books written in the social sciences, Durkheim's *The Elementary Forms of Religious Life*, I found the following kind of thing going on in it. There's the first half of the book, in which these aboriginal religions are considered, and in which the kind of attachments that these people have is examined. It's a case of a 'they' investigated by a 'we' who are social scientists outside of and with no intuitive access to why they do things. And the question then gets posed: Why do they feel as they do and what's the place of their gods, etc., and their organizations handling this? Once that problem is sharply posed, we get a tremendously remarkable shift taking place. And that shift can be found in a single paragraph of the book. It goes something like this: At the beginning he's talking with the use of 'we' referring to sociologists, studying 'they.' Why do 'they' do it? What are the attraction for 'them'? At the end of the paragraph the solution is found, and the solution is grasped in an altogether different way than the problem is posed. It is: "We know, as members, that society has that power over our minds." And that, then, is an invitation to 'us,' social scientists and whomsoever, to understand 'their' way by our knowledge of our ways.

Pretty much all conventional social science works in a similar way. So at the end of a survey, when you try to decide that you've got decent findings, you will say, 'Well, we know that religion counts for politics, and if we've got that kind of correlation then we can say, "See? We understand it." Because we know that it counts.' ('We' being 'any Member.')

Now that I want to do is turn that around; to use what 'we' know, what any Member knows, to pose us some problems. What activity is being done, for example. And then see whether we can build an apparatus which will give us those results. Where that is not to be decided as to its adequacy by what a Member knows, but may well look quite non-intuitively (i.e., in terms of our Members' intuition) strong (or weak, or irrelevant, for that matter).

We tend somewhat to be overly taken with the constraints that Weber sets for an objective social science, and that is that, say, a Chinese sociologist could understand our analysis. It may well be that you could build a social science which a Chinese sociologist could examine to see that it's cogent and doesn't at some point for the analysis rely on Members' knowledge, but where he could never do another case and could never see why you came to pose the problems that you did, or how you decided that you thought that some activity was going on which you then could show was going on. And of course that's not such a strange conception for many sorts of researches in which persons can understand a finding that they can't themselves have constructed, and can't construct another. People learn how to see math proofs as more or less adequate, and it's not tested by the fact that they can build more of them – though some people ought to be able to.

Now, the question of what would be an *account*, and what it would look like, is by and large purely an adventure. One builds something, and tries to see, 'Does that look like what I want it to look like?' And you construct ways of deciding that it is or it isn't, that it does or it doesn't, and you go on, or stop. That may sound terribly subjective. But it's only historically so, in that if you ever get a profession going, then, that you have a profession going does it, i.e., tends to define 'objectivity' for it.

I take it that we have certain opportunities at this point, whether as Members or not, and that is that one of the ways we may get to see that we have something in an analysis is that it's of that order of primitiveness that anybody can go out and look, and see that the thing seems to be as we said. Now people have come to be, in this modern age, afraid to suppose that that's doable for scientific results, though it must well have been the case that there were times in any field that people could do that. So that in biology in the 19th century there were all kinds of amateurs around, and these were people who could look at results and find another; look at an object and see that it was as people said it was. They could see it with their eyes, they didn't need a lot of equipment. And they knew what an account would look like. So they could learn the field as the field was learning. And it must have been like that earlier in other fields, like at some point in astronomy, for the Egyptians, etc. As compared to now, where that's not so.

I take it that it can be that way for sociology now, and I take it that lots of the results I offer, people can see for themselves. And they needn't be afraid to. And they needn't figure that the results are wrong because they can see them. Since beforehand they didn't know it, and now they can see something they didn't even know existed. As if we found a new plant. It may have been a plant in your garden, but now you see it's different than something else. And you can look at it to see how it's different, and whether it's different in the way that somebody has said. Now that's probably a very short term possibility, so you'd better look while you can.

And of course a way that sociology, at its beginning, could be unavailable in the way that other sciences are, is by using a technology which everybody didn't have available, and by proposing results in a format that did not say what it was that was found out in a way that could be seen. So professionally it gets rapidly shielded from examination, as is regularly the case even now with, say, more or less elaborate mathematical models of something or other. One doesn't know what they propose, or how it is one would see whether it is so. But of course few of them are intended to be descriptive of some observable facts.

I'm sure it is felt that if I propose that that's what we might do; that if I say I look at it and decide that it's okay, and it could change tomorrow as I figure my scientific intuition gets developed as to how that thing works, then I'm making it up. That's altogether a confusion, in which my personal experience is treated as the way to account for what it is that's found. Though of course it's perfectly possible that it is to be so accounted for. If so, I would take it that it's guaranteed to be wrong. But then, if we are produced in that orderly a way, it may well be that by examining how we see a thing, we'll find something out about it.

Appendix A

On some formal properties of children's games[1]

Lectures 13 and 31 constitute a pair of "interjected lectures," an "ancillary discussion of games." Following is a copy of a draft of a paper Sacks was working up, on children's games. All numbered footnotes are Sacks'.

On Some Formal Properties of Children's Games[1]

Harvey Sacks   8-27-65
pre-draft two

(0)   Here my aim will be to locate and examine the import of some formal properties of children's games. It will be seen that the located properties are central to 'socialization.' That is, in this and other work we will be engaged in posing some of the tasks which membership in a community of culture-users requires the learning of techniques for, and in exploring how it is that children's games serve to permit the development of such techniques.

(0.1)   Three sorts of treatments of children's games will be offered: First, we shall locate some properties (and their import) which seem to be general for children's games; second, we shall locate some properties (and their import) which while not being fully general, are not distinctive properties of single games; third, we will offer analyses of single games.

(1)   In previous work (see my 'The search for help: no one to turn to')* this author's discovery of a central part of the culture we have been studying,

---

[1] The materials analyzed are not included in this pre-draft. They are basically the reported observations contained in the volumes produced by Roger Barker and his group of co-workers, and made available by him to me.

[2] The word 'a' is not intendedly emphasized here. It may well be the case for any given game that it provides for several *alternative* category sets of players. I think it usual however, if there are alternatives, for these to be organized, and in the following fashion: For all sets but one to be subsets of that one.

* Probably a draft of 'An initial investigation of the usability of conversational data for doing sociology,' now in D. N. Sudnow (ed.), *Studies in Social Interaction* (New York: Macmillan, The Free Press, 1972), 31–74.

the set of membership categorization devices (MCD), has been reported, and a variety of properties and rules of use of those devices noted.

We have observed there that learning of the existence, features, and rules of use of the devices constitutes a central set of the tasks of becoming socialized. The question of how such learning takes place went unexamined. Here, among other things, we shall see that children's games are (expectably) a central set of phenomena the performance of which serves to provide for the learning of the properties and techniques of use of the MCDs.

We begin by noting some properties which may obtain for the class of games for which children have names. IT MAY BE THE CASE THAT:

(2)   For any game for which children have a name there is a category-set of players.[2]

(2.1)   To say that there is a category-set of players is to say, for example, such a statement as: Reference to the game's players with regard to any occasion of play need not involve the use of an MCD which children who play games know the use of, and which provides a relatively unique reference to each player – that is, the set of personal names – but can involve the use of a set of categories which have as one of their central properties that they provide whatever uniqueness of reference the particular game requires.

Furthermore, the category set is stable over personnel change, (b) given a maintenance of personnel the category set is stable over changes in the categorial incumbencies of the set of players, (c) and, of course, the category set is stable across occasions of play.

(2.1.1)   Given the foregoing the following phenomena can be seen to be observably orderly:

(a) In reporting their actions children recurrently say that they played game A with BB and CC (names of children, where A is a game name) and that the reporter was L, and BB was M, and CC was N (where L, M, N are categories for the game A).

(b) On beginning game play, or on changing games (from game A to game B) or on starting another play of game A after some prior play of game A, or on making changes in the personnel during a game's play, children recurrently map the set of players-to-be into the set of categories, using as the initial terms of the mapping, either the players'-to-be personal names or some pronouns, and the category set terms as the final terms of the mapping.

(2.1.1.1) The fact that in doing (b) above, either the set of personal names or the set of pronouns (or a combination) may be used to provide the initial terms of the mapping is notable.

First, the fact that both collections (personal names and pronouns) can be so used, are mappable from, involves children in learning to see certain central properties of both of these collections. The two collections consist of the categories of Pn-adequate devices of a particular sort. They, and only they,

provide sets of categories which are mappable into the categories of any other Pn-adequate device. With this some central uses of them, for example, their use in preserving reference in discourse which involves reference to varieties of categories, can be grasped. An exploration of this basic 'mappability from' status of the two collections might prove illuminative of how come it is that when the categories of any two devices, one of which is a category from one of these devices, and one from some other, are employed about some given person, sentences tend to be formed with the category from these devices as subject and the category from the others as predicate. (The matter is not strictly grammatical since the sentences can readily be formed the other way.)

Second, while both devices are basic they are not equivalently powerful. The set of pronouns are generative in ways that the set of personal names are not. Thus, given the set of pronouns, one can, for example, form questions which are directed to determining the categorial status of some person vis-à-vis any other categorization device, including the set of personal names.

The basic character of the two category sets is something that children in doing such game relevant actions as assigning game positions may – insofar as they do not yet know that – come to learn. It may be noted that they will be regularly forced to use the two devices. They cannot routinely map from the categories of game A to the categories of game B since any two given games may not have categories of the same relative uniqueness, even if they can be played with the same complement of players.

Now the fact that game play can have its mapping done with either the set of pronouns or the set of personal names as the initial terms turns out to provide a solution, a formal solution, to a very familiar observation. It is widely observed that children's groups have an 'open-ness' which is not present in adult groups. Why is this so? Or rather, how is that fact provided for? In solving the problem we will also see how there is wisdom in the proverbial advice to a new kid in a neighborhood, that, if you want to get to know the kids, just go to the playground, and try to get into the games.

If it is the case that mapping into game categories can properly be done from the set of pronouns it follows that the set of players need not initially have that acquaintanceship with each other which would involve them in using personal names to each other. For children, then, in contrast to adults, the most prominent of social activities in which they engage are so constructed that entry to them does not require prior use of the rule-governed occurrence of an exchange of names. It is of course not merely the case that an occasion for being properly introduced, or otherwise learning personal names is not a requisite for participation (and for those activities which require written or phoned invitations, if not introduction, then at least the name need first be known somehow) but name exchange need not take place at all – for game activities, reference to someone can then be accomplished via the game categories.

The fact of the adequacy of the pronouns as the initial terms for mapping into game categories is not of course sufficient to provide the opportunities for 'strangers' to play. Other matters are also relevant. For any given game, the

playing of it requires a personnel adequate to its categories (and whatever number of incumbents the categories may require). The set of acquainted persons who desire to play some given game may not satisfy the categorial constraints – and indeed under even minimal formulations of the categorial constraints the set of acquainted persons may not, as is regularly required for team games, add up to an even number. The chances of any unacquainted person to get into a game are then heightened by virtue of the possibility that if he is not let in, sought in, some acquainted person may have to be left out. For adults that problem is less pressing – since adults tend to 'come in pairs.' There are however a variety of occasions where the more or less even numberedness of participation provides the basis for the seeking out of unacquainteds – e.g., for debutante cotillions.

(2.1.2.)   Elaborating briefly on (a, b, c) of 2.1 we note: Neither change of personnel, nor exchange of categories for a stable personnel, nor replay of the games are events which operate to change the game categories.

Given these facts it may be the case that children's games are central environments within which the central property of the organization of this culture – stability of categories over interchangeability of personnel for a large number and important group of activity relevant positions – is learned.

It may be noted that this fact is not learned in connection with the first basic MCD children learn to use – i.e., that one, two of whose categories are (mother, father). Children are not taught, and do not seem to take it, at least when young, that there is an interchangeability relation for these categories between a variety of persons. It is that in part which may account for (a) the fact that there is apparently not a terribly smooth shift in the divorce–remarriage or death–remarriage scene. There is, that is, not merely a proper number of incumbents of the categories (mother, father) for any given child, but there is a proper incumbent. (b) The fact that the activities which are learned to be activities of these personnel, while (obviously) performable by any persons who may occupy such a position for other children are not seen as obviously adequate; 'I want my mother to do it.'

(3)   For any children's game which has a name there is a category-set of game events. The game events are the observables the game provides for. The notion of 'observable' that playing games involves one in employing is (obviously) central sociologically. For, 'observable game events' are events which are detectable via the game rules; this is deeply true. It is, that is, not merely a matter of the game rules being used to determine whether a given event is game-legal or not. Rather, in contrast to many objects for which, at least it is conventionally said, one can know that the object is nameable or has a name one doesn't know, the very specification or location of the event as something may involve use of the game rules. To learn that one needs some set of rules merely to see what is going on in the social world is of course to gain among the most basic of social resources.

In this regard, the recurrent feature of game-events, that one can see not

only 'legal occurrences' but one can also see violations, that the rules may be used to observe violations is perhaps of similar interest to the way that programmatic relevance of categories provides for the observation of absences.

We shall return to the matters raised in this section anon.

(4) The categories of the category-set of players of any game are *programmatically relevant* (see SFH).* This apparently central feature of the use of some MCDs is given a specially powerful formulation for game playing. Any given game is properly non-playable unless each category of the game's category-set has the proper number of incumbents. Every time that children desire to play some game they are confronted with the fact of programmatic relevance of game categories.[3]

(4.1) It is noticeable again that those basic categories of the categorization device 'family,' i.e., (mother, father) are not such as in their use provide kids with the occasion for learning programmatic relevance. For these categories, i.e., mother, father, do not merely have proper number of incumbents (in this culture) they have proper incumbents. Thus, while one certainly learns the notion 'missing' as an observable state of affairs with regard to (mother, father) one does not learn what is core to programmatically relevant categories, and that is that there are things which cannot properly be done if a category is unfilled, or if an incumbent is temporarily absent, which can be done if one is able to get the category filled.

(4.1.1) Kids who will not play baseball without a right fielder will play even if the right fielder they get is utterly incompetent – e.g., a very small child. And, an obviously incompetent person may get the opportunity to play in a game in which their performance is no advantage at all vis-à-vis game outcome because the position happens to be unfilled.

(4.1.2) Given the fact that for some games there are various category-sets, some of which are proper subsets of one of the category-sets, and given programmatic relevance, we see how it is that playing a variant of some game, e.g., two-man basketball, can get modified as potential players happen to arrive. Each pair of potential players can take a position as the game moves to basketball proper, through the variant subsets – two-man, three-man, etc., though apparently when there are five on a side, new arrivers must wait or start another game.

(4.2) The fact that programmatic relevance is given such an emphasis in game play may be worth some consideration. The remarks are strictly

* 'The search for help.' See n. 2 above.

[3] It is no objection to this observation to say that 'basketball' can be played with two on a side. Two-man basketball can only be played with two on a side, i.e., cannot be played with only two or three or five or more players.

speculative. It is perfectly apparent (to the author) that programmatic relevance of categories is utterly central to the working of the community of culture users. I cannot offer the materials for backing this point up in this draft, but I refer the reader to other work of mine, and ask him to consider for example the way in which persons who are unable to find a spouse seem to take the matter with such grave seriousness. Now it is not at all obvious how it comes that persons so deeply feel the pains of missing things which in the first instance they have never had. Yet that they do miss them is obvious enough, that they do get deeply pained is obvious enough, and that it is utterly important that they do miss and do get pained is obvious enough.

Perhaps it is the case that the central focus which children's games give to programmatic relevance, the constant focus that is involved in the import of not having a complement of players, and the clear comparability of having and not having that complement, provides them with the basis for the variety of later ways that they can so deeply orient to programmatically relevant category-sets.

(5)   Closely related to the foregoing and generally central is the fact that the categories of any category-set of any given game are used, in a variety of their uses, according to the *consistency rule*. (see SFH).

We may note that as it was with the 'programmatic relevance' feature so is it with the consistency rule; that it is operative for game categories in a particularly strong fashion. The category-set of each game (except for game variants) are mutually exclusively relevant. If one has enough players for a variety of alternative games one does not pick some categories of one game and some categories of another. If one does not have a complement of outfielders for baseball one does not choose a category from some other game which does not require so many incumbents – e.g., fill up the infield with players and put a quarterback in the outfield – because there is only one potential player left.

(5.1)   Let us first note: The consistency rule holds not only for any game's category-set of players; it holds as well for any game's category-set of game events. The import of this will be considered in the ensuing.

(5.2)   The combination of programmatic relevance and the consistency rules has as its import that: When the positions of a game are occupied, it is not possible to expand the game by adding positions from other games, but either new games or such things as substitutions must be introduced.

(5.3)   We have said that the consistency rule is especially powerfully operative in games; while the fact is obvious enough its import remains to be considered. The remarks to follow are again (as in 4.2) quite speculative.

First, only mentioning now something to be given fuller consideration later, we note: There is the fact of learning how much orderly activity can be

done by use of only a restricted set of categories (player categories), and particularly where for each person there is at any given time but one characterizing category.

Second, there is the enormous importance of seeing that categories come in sets, and that if for some activities some category or categories are appropriate then they may well be exclusively appropriate, and that they can effectively be exclusively appropriate – effectively, that is, whatever needs get done can get done without moving out of the category-set.

Third, especially since it is the case that there are a larger than one set of Pn-adequate categorization devices, persons must come to learn that if they are engaged in some activity for which some category-set, say a particular MCD, is exclusively appropriate, then it is improper to categorize personnel by reference to some other MCD and to use their category status in that other MCD to involve them in the given activity. Recall here the discussion of the search for help for suicidalness, and the use of R.*

Fourth, and here we point to one of the most core importances of children's games: The fact that children's games operate under a unique combination of the operation of the consistency rule for some category-set of players and some category-set of game events, means that almost as strong a rule of relevance is operative in children's games as is theoretically conceivable. This cryptic observation will be given the elaboration due it in the ensuing. And for children to come to learn the phenomenon of relevance, its uses, and its import for the formulation of their own and the grasp of others' activities, is utterly core to their socialization.

Now while it is clearly the case that the relevance phenomenon is much more powerful and much more simple in children's games than it will be in the adult world, the fact that this (and other of the phenomena we have been considering) are first dealt with in a relatively pure form is non-trivial.

It is regularly said by those who on their own say-so are engaged in studying the phenomenon of play, that one of the special facts about playing games is that in the game world sets of attributes of persons that are normally relevant are made irrelevant; for example, social status, age, and the like. We shall leave aside for the moment the point that there are centrally important ways in which the analysts' notions that persons have sets of attributes which are leavable aside – both that they may be said to have them, and that they are leavable aside – is deeply misconceived. With regard to children's games the point would seem, if we may glean it, just wrong. For it is, I think, in learning the multiplicities of games, and their player category-sets, and the category-sets of game events, that children are first engaged systematically in dealing with the multiplicity of category-sets and the sorts of relations; e.g., mutual exclusion, that obtain between sets. To get into various games is not to remove some relevancies, but to add some. The worlds of young children

---

* 'R' is a collection of paired relational categories. See 'An initial investigation of the usability of conversational data for doing sociology,' in D.N. Sudnow (ed.), *Studies in Social Interaction* (New York: Macmillan, The Free Press, 1972), 31–74.

are (notoriously) event-poor and membership-category-poor. Games are event-generative and membership-category generative.

(6)   A passing point from the foregoing may be picked up: Children's games are event-generative phenomena of a rather particular sort. It is notable that even for the simplest of children's games it is the case that via a restricted set of categories of players, a restricted set of game events and a restricted set of rules, an indefinite set of ordered occurrences may be generated.

Now, it is widely observed that one of the most crucial things that young children have to learn in becoming socialized is to 'concentrate.' The observation that they do not have powers of concentration may be given a formal explication, and the ways that games help to teach them what it is and how it is that one concentrates may also be given such a formulation. A notion of concentration may be formulated as follows: A person may be said to be able to concentrate if for some string of his activities a set of rules may be specified such that those rules generate some relevantly sized string of actions. It is possible, but not necessary, that some subset of the set of rules provide for ending the string of actions, and if that is so, then a person may be said to concentrate if he produces a string which is only ended on the proper use of the ending rules.

Now it seems that when it is said of children that they do not know how to concentrate, what is being observed is that the string of actions and the sets of rules stand almost in a one to one relation.[4] If that is so, it is of course difficult to say that the rules which might be constructed to generate some given action of theirs are employed by them to generate it. Their actions are more plausibly seen as random.

There are striking similarities between the rules that generate the first words children speak and the first games they play. Murdock's paper in *Anthropological Linguistics* and Jakobson's analysis of it (in Heinz Werner (ed.), *On Expressive Language*) indicate that the simplest occurrence which is recognizably a word, i.e., rule governedly meaningful, is one that consists of two parts, used in alternation, and reduplicated – for example, Mama, Papa, (consonant vowel, consonant vowel).

It may be noted that the simplest of children's games, those social activities which provide perhaps the earliest, or among the earliest instances of what may be called concentration socially, are games wholly built in this fashion. They have two parts, for two players, one action for each player, where the actions alternate, and where the playing of the game consists of an indefinite repeat of the alternating actions; for example, rolling a ball between two kids, or pushing an object between them; one pushes and the other catches – a

---

[4] Cf., "The patient appears to be unable to focus his attention on any one topic for more than a few moments. Frequently he suspends the conversation in the middle of a sentence or he may turn away and close his eyes." Paper, Victor et al. in *JNMD*, 128, p. 529. Here lack of concentration found in a relation of less than one between rules (for generating a sentence) and produced actions.

reversal and a repeat of the initial, etc; other games; swinging, one pushes, the other swings, and the reversal; hide and seek, etcetera.

There is obviously rather good basis for these games lacking completion rules; to have such rules requires an orientation to developmental features of a game – being, e.g., able to count so as to keep score for the simple games that end when someone reaches some given score, as compared to those much more complicated ones which have internal histories – i.e., for which the state of the game at any one point requires reference to what has so far happened.

Children then learn the rudiments of concentration, i.e., the production of extended strings of rule-governed actions, in the primitive games they play. The fact that they are able to play such games for such long times may be marked down perhaps to the fact that at the point they play them they lack what adults would naturally use to monitor the game, an awareness of such things as the number of alternations they have gone through; the game lacking but the simplest of histories, proceeds in terms of who did what last on any occasion of play. And on any next occasion there is relevant reference only to what it is that has just transpired. The simplicity of the rules involved consists, of course, of the fact that the rules need only provide for the initial pair of actions and a repeat with alternation rule. (The observation that in playing games children learn to concentrate need not then be a merely bland remark.)

(7)   The category set of game events is organized into subsets, where: For each subset it is recurrently the case that (a) the subsets have a listable group of members, each of which have names, and (b) for any given subset, on some event occasion, the occurrence of a member of the subset excludes the occurrence of other members of the subset. (For the simplest of games this remark is trivial.)

As compared to the circumstances that adults face, the situation, while terribly important, is oversimplified in that in games the relation between 'event occasion' and 'event subsets' is extremely sharply formulated; consider baseball. At some point the next event-occasion may be specifiable as 'a pitch' and the subset of possible occurrences may then be readily specified (given some further contextual information, the subsets may be more or less sharply reduced – e.g., if there is no one on base). It is, by the way, given the fact that there is such a sharp relation between 'event-occasion' and 'event-subset' that the notion 'expectable event' gets an extremely sharp formulation in children's games, and the notion is obviously an important one. In simpler games than baseball the matter is considerably sharpened yet. 'Next event' in a game of 'catch' is either receiving or throwing for either player and the relation of event-occasion and event-subset reduces to one possibility. The notion of expectable next event is of course a rather crucial one; in children's games one learns to use it.

(8)   Children's games are describables, and in deeply interesting ways.

The category set of players provides an adequate set of categories for referring to personnel. The category set of game events provides an adequate set of categories for referring to game occurrences.

One of the most central things that children must learn is that for some domain of occurrences there are some membership categories, reference to which provides that the report of the action is adequate. One need not, on the one hand, use every possible combination of categories that might characterize the personnel involved, and it is alternatively not any category that might characterize the personnel which does the job. In children's games players come to see that however complicated the events are, and however extended the game is, all its events are reportable by reference to the player categories. Of course the unique tie between a set of events and a set of membership categories is a simplification of the problems of choosing relevant membership categories (and most particularly category combinations) with which they shall later be occupied. But the task and that it can be accomplished – i.e., the appropriateness of a variety of restricted category sets – is something which game play may well make powerfully apparent. (Possible relevance to doing stereotyping.)

When we said that children's games are deeply interestingly describable what we meant to notice is this: It is not merely the case that games are describable occurrences, the play-relevant events providing the terms for description, and the player categories the actor terms, but, quite elegantly, the descriptions can be expanded in an orderly fashion. Thus one can report a baseball game by giving the score; one can proceed down to inning-by-inning recounting, or play-by-play recounting; and one can shift the detail of description in such an orderly way. The possibility that a request for more detail than the detail offered in some report may be handled in such an orderly fashion is an extremely neat one.

It may be that such a feature (which in large part mainly obtains for games not played by the youngest of game players) is relevant to learning to converse, i.e., for one to hold and to explore a topic. The game as a topic of conversation would be a particularly simple, though obviously possibly rich, item. Relatedly, the comparability of play-occasions – where comparability is of course handleable while retaining the orderliness-of-level-of-detail consideration.

A further way in which the describability of games is interesting involves what might be called the non-perspectivity of game reports. That is to say the terms by which participants locate what is happening provide the terms of the report, and the player categories are so usable too. The usability of player categories and game event categories for reporting the occurrences to whomsoever provides a sense of 'generic domains of membership categories and their implicated activities' which is otherwise relevant in seeing and reporting a great many other such 'domained' matters – for example, occurrences of the family; the usability of 'what the pitcher did' and 'what the mother did' may have deep similarities, and to learn that what happens between person A and person B for some set of occurrences is graspable by

whomsoever if they are informed that, for some activities, person A and B are mother and son, may well be both unobvious and non-trivial. (It would be especially non-trivial for the family since, as we have observed, the categorial members are not treated as interchangeable, but are seen as 'proper' members, and perhaps then, relatively unique, and if unique, perhaps it might get seen that reporting events requires 'personal information' and not mere categorial reference.)

Related to the non-perspectivity of game events and reports, and differing from the events of other sorts of units, is the fact that as is obvious enough, games can be watched; and what is going on can be seen as well by an audience as by participants. The same set of terms used by the one to see what they are engaged in is usable by the observer to find out what is happening. The 'public' character of games is then something quite special – there are a huge number of events that can take place in the view of others but where the others – even indeed if they can hear the talk, do not have available to them what is going on in the way that those who are participating do.

(Let me note, for those who might read this draft; I am not intending to say as news, games can be watched. I want to come to see how that fact is interesting, and I want to see what apparatus is necessary to provide for its occurrence. The same goes for a raft of the points made in this draft – in later ones we shall start with a set of properties and then provide for the known facts.)

(9)   The following sorts of phenomena that children in playing, not necessarily named, games do, have widely been observed.

On one occasion, he (3:10) and other children had made a 'ship' in the schoolroom, with an arrangement of tables and chairs. Phineas' part in this was comparatively a passive one, as he was but 'a passenger' on the ship, and was going on with his own pursuits on the voyage, sitting at a table and sewing a canvas bag. Miss D was with him ' in the ship' and all around them, the crew and the captain carried on the business of the voyage. And when presently a new supply of thread was wanted, and Miss D said to Phineas, "Will you get it out of the drawer?" Phineas replied, "I can't get out of the ship while it's going, can I?" and called out in a stentorian voice to the 'captain,' "Stop the ship. I want to get out." After some demur, the ship was brought into a 'landing stage' and Phineas got out, secured his thread, and got in again, saying, 'Now it can go again.' (p. 105, *Intellectual Growth in Young Children*, by Susan Isaacs)

She looked up at me expectantly anticipating that I would push her. I said firmly, "No, put your knee in the wagon and you can push yourself." She sat for several seconds obviously waiting for me to push her. She waited long enough to be certain I wasn't going to push. Then she got down, put one knee in the wagon and the other on the floor of the cement porch getting ready to push herself. In order to encourage

her, I said, "Come on." She didn't move. She looked straight ahead. She announced, "There's a car coming." Then she looked at me indignantly. She was seemingly disgusted that I couldn't see this car that she announced. An imaginary car was coming and she had to wait for it to get out of the way. (p. 95, *Margaret Reid*, by Barker and Wright, unpublished but copyrighted)

She gently put the doll in the carriage and sat down on the porch floor spreading her legs out in front of her. She hardly settled on the porch when she looked up at me and said, "You fetch the doll."
    1:20 I was writing and said, "Me?" Meanwhile I pushed the carriage so she could reach the doll easily. She explained, "Not the wetty doll." In other words she meant another doll than the one she had shown me. She reached in the carriage and got a slightly larger doll, "This is her sister." (ibid., p. 159)

Let us consider the above materials. In the remarks to follow we revert to the looseness of the 15 or so pages on game playing which were not graced with pre-draft status.* I want to consider Phineas' actions; the big points will be present, but crudely.
    It is obvious enough that a central property of game events is that for any given action the set whose members are mutually exclusive (legal–illegal) is of first-order relevance. The special importance of the fact lies in an affiliated one, and one that makes for the sharpness with which games provide a sense of the omni-presence of right–wrong considerations for actions: If an action in a game is attempted, and is done illegally, then the attempted action does not count at all. For purposes of being counted as an action, the thing is only countable if done, and if done correctly. An illegal action is invalid. Note the closeness of this to: If the programmatically relevant categories are not filled, the game can't be played.
    Now it may be noted that this does not obtain for some rather central actions of young children – for the case of language – their speaking. Their talk may be violative of the correct adult ways of speaking, the correct ways known by just slightly older children, and be heard as saying the thing they seek to say. Their speech is satisfactory to get what they intend said, although (although in quotes) it is incorrect. The penalties for doing something poorly are not a failure of it to be treated as having been done at all.
    Now consider the sort of situation Phineas is in; where the play consists of simulating the actions in some possibly real environment. There are a variety of alternative contrast sets obtaining for actions in real environments, and most particularly those for which danger is involved – a proposed action can be possible of accomplishment or impossible of accomplishment, it can have injurious consequences or not have injurious consequences. If the child is

* There is a 15-page text, 'On some properties of children's games,' dated 8–26–65, which *is* given pre-draft status: 'pre-draft one.'

playing with some real environment treated as a play environment, then if any given action that might be proposed in the play environment gets its treatment in the play environment by reference to the legal–illegal consideration, where that consideration involves 'illegal means not accomplishable,' and where the determination as to which alternative the proposed event involves is determined by a direct mapping from some alternative the event involves in the real environment where, e.g., possible is mapped to legal, and impossible to illegal, then the assessment of what in the game can be done, provides the kid with a very sharp view of what in the real world ought not be done, where in the game world the consequences have a clarity that may otherwise not be apparent. The concern with legality, and the concern with determining how to determine whether legality is satisfied, which may lead the kid to consider the proposed action vis-à-vis the actual correct properties of the real world, then provide any given player among the set of players and observers with opportunities to learn what can be done and what not in a real world – since players will be ready to propose that that can't be done; is illegal in the play world – and to demonstrate their grasp of the real world's consequential and non-consequential features by those they propose and bring up and come to terms with in the play situation. Play then becomes an environment for learning and demonstrating criterial matters in real world action.

(10)   For a, and perhaps the, class of team games, the teams have a composition of duplicated category-sets. I.e., both teams, or whatever number of teams there are, are composed of the same category-sets of players. It may be noted that it is not at all apparent why this need be so. Certainly it cannot be claimed that only this way can equivalence of strength be maintained, for, obviously this neither guarantees equivalence, nor is it the case that if, by use of this there is not equivalence, play is not done or not permissable.

But, again, duplication is central to playability, or in any event play is not done if duplication is not present, and the set of players-to-be may not be fully used if their full use does not provide for duplication. The fact of game variant's permissability may seem to suggest that duplication is even more central than fully complemented categories, i.e., one can play game versions if there is duplication, though full complements for the game proper are not present. (One does not apparently try to get at least one fully complemented team out of the players-to-be and then use the remainder to fill as well as can be, the other team.)

(10.1)   Some observations may be offered about the duplication phenomenon. As before, it must be noted that the remarks are extremely rough. We may proceed first by noticing some relevancies and occurrences of duplication apart from the game situation.

The remarks are relevant to the discussion in 'Search for help,' and as such are to be incorporated into further versions of it. There it is noted that one

who is not, or is no longer a member of some particular duplicated category-set may feel that as a considerable lack. It is also quite apparent that for members of some particular case of a unit that is properly a duplicated unit, the fact that there are persons who are not such members is also an annoyance. It is, that is, not sufficient for any given Member that he be ensconsed; he is concerned that others be so ensconsed in other cases of the unit. Why should this be so?

Two observations:

1   For any unit-domain, which is a domain by virtue of the fact that all cases of the domain are properly composed of a duplicated unit, and all persons are properly ensconsed in a case of the duplicated unit, a single set of rules may operate to govern intra-unit activities; and the rules then obtaining between any given group of persons so ensconsed are available to any others who know no more than that the group are ensconsed together in a case of it.

2   The use of a single duplicated unit may well constitute the most powerful basis for generating universally usable experience, i.e., anyone's experience is relevant to anyone – or anyone, at least, occupying a given category of the unit may have or seek from anyone so situated, relevant experience to or from them.

There are some close relationships between the relevance of duplication in games and its relevance in properly duplicated units. Games, as before, are stronger – thus, one not ensconsed in a duplicated unit simply cannot play; the way to get to play is to get into such a unit – for any given person. So too there is, for activities of the duplicated units, or activities of persons ensconsed in such units, or activities of persons who may formulate those activities as activities of the duplicated units, that one who is not so ensconsed is not routinely a participant. Unaffiliated males and females are not routinely dinner or party guests, where the fact of 'being a couple' is quite relevant to participation.

The kinds of accessibility of anyone's activities that incumbency in duplicated units provides for, ought to be considered: The limited materials needed, given the operation of duplication, for gossip.

[There are 4 missing pages in the draft manuscript]

(12)   We have proposed that kids learn some of the formal properties of MCDs in game playing. Now it could easily be recognized that some of the properties of MCDs in general hold also for games; but is it particularly evident that the game group provides rules used via the other?

Yes. Note that it is the case that a good bit of non-preformalized games children invent and play in may be seen to involve just this: The fact that there is, for some domain which the kids come across, an MCD, provides them with a basic set of resources for building play. Here the so-called imitative play – house, the various occupation games – painter, doctor, etc.

The fact that kids find there are a set of activities which cannot be done within the severe constraints of playing is perhaps for them a demonstration

of the viability of a set of categories, or some category – e.g., a given occupation.

We can perhaps fairly easily come to see how it is that these games are seen to be 'imitative' though it is terribly important to see that such a claim is not analysis. (Note the relation of the observation that much play is imitative, to that that much play is absorbing, ought to be given attention. We have proposed, perhaps not in draft yet, that it is quite easy to see why the observation 'games are absorbing' gets made. It is made by virtue of the fact that in the first place observers can see game play via the same terms used by participants, to notice what is and is not an action of the game.

If observers use the constraints players use, then observers will of course come to see, as things the players do, just the things provided for and no more – i.e., no more is a something done; no more is observable if the rules are used. Then the fact that the observer sees no more providing him with the basis for saying that the players are doing no more, permits him to see the games as fully occupying the action and interest of the players. People who do not know the rules of some game not only find it dull, but may also find that the players don't seem to be involved, i.e., are standing around doing pretty much nothing.)

To see actions in play as imitation is simply to fail to see them as play-rule controlled, but to see them via the thing in the real world whose properties the children in play may be engaged in exploring.

(13) Whatever developments there are, are proved in actual play. For many of the things children learn or are taught it is not the case that there is a practical efficacy criterion operating to provide them with an opportunity to see either that they have learned, or how it matters that they have learned. In games, the fact of a possible development, a change of skill, is tested and provable, and only so provable in actual play. Given the relevance of games to children's thoughts even when not in play, it may well be that this is among the sharpest of ways that the difference between reality and fantasy is brought home to them.

For what they will be in the future, their occupations and other such possible accomplishments and statuses, that is not clear; i.e., the difference between reality and fantasy. But it is clear here, and so too is the beauty of success.

(A series of facts involved: The difference between the dreams one has of good performance, and the clarity of what good performance is, so that it has a clear formulability in dreams – and how one does indeed perform. The difference between having a good argument as to what one ought to do, and how one ought to play so as to succeed, and how it is that one does indeed perform. So, not only reality and fantasy, but theory and practical efficacy, are both sharply formulable.)

The set of features that we have remarked on as those games have, gain somewhat in their general significance when one stops to notice that it is not merely the case that one can play a given game with a stranger, and thereby have these features implicated in one's activities with one one doesn't know,

but rather more importantly perhaps, there are more than a few games which do not at all require that the participants be Members of the 'same' community of users of a culture. There are of course some other activities which are doable, love-making for example, but perhaps the latter and the former are somewhat to be discriminated as to the import of the fact that they are doable between mutual non-Members; the resources to be brought to bear are perhaps less extensive in the latter.

In any event, to the extent, then, that game play, for given games, is doable across cultural boundaries, it is not merely the case that games, like language, is present within each boundary, but more, it is the case that the ways games are done are unlike the way talk is done – highly similar, and graspably so without regard to the culture which produces the gameplayer. It is, I would take it, an extremely strong criterion of 'cultural universality' that one require of some feature, not merely that some version of it be present in the various relevant places, but, more stringently, that the features be present in each such place in a way that permits them to deal with persons not from that place at all, and deeply different, but where the criteria for doing some given activity, for doing it properly, for sustaining it and cooperating on it, permit them to restrictively but interestingly, each sensibly interact. Without regard, then, for the issue of universality, the stringent test of 'same feature' we have suggested would seem to be satisfiable to some extent for some large collection of cultures, for games, and perhaps for little else. Cultures whose members can not negotiate, who can not successfully argue – though they have access to a common language – can nonetheless successfully play the game on different or the same teams.

That fact is a rather specially powerful one. In its light all our previous discussion should be reassessed as to the size of its import. What constraints are there on not merely playing a given game, but on one some occasion of play, playing it with a foreigner? Note too, that the origin of a game may quickly become irrelevant in any of the places of its play. The incorporability of games into cultures in such a way that – unlike loan words, though alike to other things – is a notable feature. But the thing again is, that though incorporated, they do not become nationalized, as for example it is the case for personal names. The latter are incorporatable into different languages than those that generate them, but having been incorporated, it regularly remains the case that where they came from can be determined by inspection, and they are not further generative within the given language that has incorporated them. It is, in short, a rather stronger thing to say about the common humanity that it may be that any given set of persons may play some given game together, than to say that any given culture has a language, where the Members of two different cultures cannot talk together, though each is a language user.

Another fact about games: We have noted in some other materials that one thing about some rules, one thing that kids learn about rules is this: That when a rule has been announced by someone who has some authority to do such things, then the rule is invokable by others – by those who would lack

the right to announce it – in asserting that there is a violator. We noted this in connection with the Schoggen materials on some dinner occasion his observers presented. To follow is another instance from his materials (p. 1331–4) in a school room; the teacher is having the kids who have been gathered round her in a circle move their chairs back to their desks – this is first grade.

02'55"   "Row 2, you can take your chairs and go quietly back," says Mrs Kingsley in a calm and quiet voice.
    Reenie still sits studying the group, the same pensive expression on her face. Suddenly she cries in loud and directive tones, "Ken, you're in row 2" and she points accusingly at him, her right arm at full length straight out from her.
    Ken hesitatingly gets up and starts to go back to his desk.

On this occasion there are several such announcements made by single or groups of kids. This fact, the invocability of rules, is one that is, I take it, widely operative in games. The kind of observation of activities, vis-à-vis their conformity to some rule, where a rule having been proposed, the fact that actions are or not in conformity to what it proposes is no longer a matter strictly under the control of the rule's announcer, provides a sense of the objectivity of rules. Kids see them as objective, and of course not only kids, and the notion that rules can be used to monitor actions such that violations as well as conformings are detectable through their use and their use is not restricted, is, I take it, of more than passing interest.

How they come to take it that there is such a division of competence which permits them to invoke that which they cannot pronounce, which involves them in using, to observe, that which has just been announced, that I do not know. We are of course rarely amazed when, on an umpire's announcing some decision – strike – the crowd boos in disagreement. That they can conceive to disagree, and that they would have been making for themselves the determination to which his is to be compared so as to be found possibly in agreement and possibly not, is the sort of thing we are pointing to as of interest. The crowd, the players. Job, after all, could see it to complain. Even His rules, once announced, are partially thenceforth outside his hands. Cf. The Grand Inquisitor discussion.

On this rough observation about the invocability observability of activities re rules, one may consider the draft somewhere in the notebooks on learning a language wherein it is observed that even quite young children go about correcting the language performance of others. There we take it that to some extent some rules of a language are not merely 'unconsciously followed' (cf. Boas' introduction to the big volume on American Indian languages, now reprinted by Georgetown University Press) but that they are known in a way that permits them to be used to determine errors and what it is that for some detected error, a correct action would be. The importance of this for the

non-disorderliness of some errors is considered there.* In that sense, rules of a language, as rules of a game, provide a domain of observables where knowing the rule, in the sense of being able not only to use it to produce correctly an action, or to detect a correctly produced action, but to see something as a version, relevant but incorrect, is, if not crucial, then clearly not trivial. As the paper referred to gets further developed, the matter will be given more careful consideration.

* The "draft" referred to here has not turned up.

Appendix B
A Note on the Editing

In lecture 04.a, p. 281, a bit below the data, Sacks says: 'You might consider, if introductions are going to take place, and the therapist is going to do them, . . . ' The unedited segment runs off differently: "You might consider, if introductions are going to take place, and *this fellow Dan* is going to do them . . . " [emphasis added].

In contrast to the pronominal changes discussed earlier (Fall 1964–Spring 1965, lecture 2, p. 18, n.1 and Appendix A) as matters of policy, the change from "this fellow Dan" to "the therapist" runs acutely counter to editorial policy. In this case the policy is one of preserving Sacks' categorial references and the non-occurrence thereof, in light of his concern with the phenomenon of category-selection (see, e.g., Fall 1964–Spring 1965, lecture 6, esp. pp. 41–2, and Spring 1966, lecture 1 and lecture 04.b, esp. p. 295).

On occasion, editorial policy was confronted by problems arising from the editing process itself, and such was the case here. The lecture designated 'Spring 1966, lecture 04.a' is a combination of materials from two lecture series in which successive runs at the introduction sequence were made: Fall 1966 (lectures 1 and 2) and Spring 1967 (lectures 6 and 7). Extracts were taken largely from the more developed Spring 1967 discussions, and the introduction of these latter materials into the Spring 1966 series resulted in an anachronism, in the following way.

The Spring and Fall 1966 lectures are associated with a data handout which uses the speaker-designation 'Therapist' (see the handout preceding this lecture, pp. 270 ff). This designation originated in Sacks' 1965 transcript (see the handout for Fall 1965, pp. 136 ff), and subsequent transcripts followed suit. But in late spring 1966 a new transcript was being prepared in which, specifically by reference to Sacks' concern to "analyze" such things as categories, and not just "employ" them (see Spring 1966, lecture 04.b, p. 295), the categorial designation 'Therapist' was replaced by a name, 'Dan.' And the Spring 1967 handout (not included in this volume) was taken from that new transcript. (A segment of the 'Dan' transcript appears in the unedited version of Spring 1966, lecture 30, but in the interests of simplicity it was replaced in the edited version by the segment which appears in the Spring 1966 handout.)

All of which is to say that the Spring and Fall 1966 data handouts use the speaker-designation 'Therapist' while the Spring 1967 handout uses the designation 'Dan', i.e., the two sets of materials used to assemble Spring 1966, lecture 04.a have data with two different types of speaker-designation.

And Sacks' references to the speaker in question tend to vary accordingly ('tend to' because he uses other means of reference; e.g., pronouns). Thus, in Fall 1966, lecture 1, p. 1, just after a data fragment with the designation *'Therapist'*, Sacks notes that if the introduction series is "going to come off as an utterly routine, uninteresting fact, *the therapist* could pick either Al or Roger to start off with, then go around continuingly." And in Spring 1967, lecture 6, p. 1, just after a data fragment with the designation *'Dan,'* Sacks proposes, "You might consider, if introductions are going to take place, and *this fellow Dan* is going to do them, what the import would be of various ways that he would go through the three persons he's going to introduce Jim to" [all emphasis added]. (There are no explicit references to Fall 1966 or Spring 1967 in this Volume.)

Perfectly simple. A transcript has 'Therapist' and Sacks says "the therapist"; a transcript has 'Dan' and Sacks says "Dan." The anachronism cropped up when materials associated with a 'Dan' transcript were introduced into a lecture series associated with an earlier 'Therapist' transcript.

To avoid the incongruity of a speaker designated 'Therapist' in the transcript being referred to as 'Dan' in the text, the reference term which actually follows the 'Therapist' fragment (i.e., from Fall 1966, lecture 1) was inserted into a segment of text which actually follows the 'Dan' fragment (i.e., from Spring 1967, lecture 6). The result is the hybrid, "You might consider, if introductions are going to take place, and the therapist is going to do them . . . "

In short, although counter to editorial policy, a person-name was changed to a categorial term, to eliminate an anachronism generated in the editing process.

There are eight places in lecture 04.a where reference is made to 'the therapist.' Two of them (pp. 281 and 284) have this configuration of Spring 1967 text with Fall 1966 reference term. Another (p. 285) is simply an excerpt from Fall 1966, there having been no discussion of this particular matter in Spring 1967. Two others, one (p. 284) from Fall 1966 and one (p. 287) from Spring 1967, involve a change from a pronominal reference ('he') to the categorial. And finally, there are three changes of a Spring 1967 'Dan' to 'the therapist' (pp. 282, 283 and 286), there having been no relevant references in Fall 1966. Following is the collection of changes [all emphasis is added].

(1)   Spring 1967 text with Fall 1966 reference term

Fall 1966, lecture 1, p. 1 (just after 'Therapist' fragment):

"That is to say, if [the introduction is] going to come off as an utterly routine, uninteresting fact, *the therapist* could . . . "

Spring 1967, lecture 6, p. 1 (just after 'Dan' fragment):

"You might consider, if introductions are going to take place, and *this fellow Dan* is going to do them . . . "

   Spring 1966, lecture 04.a, p. 281 (after 'Therapist' fragment):

   "You might consider, if introductions are going to take place, and *the therapist* is going to do them . . . "

(2)   Spring 1967 text with Fall 1966 reference term

Fall 1966, lecture 1, p. 6:

"You want also to notice that we have what could possibly be seen as a rather intriguing grammatical form, in the sense that, that Jim is being introduced to each of them, is handled by *the therapist's* statement remaining open in a special way, while inserted into it are pairs of complete statements by other people."

Spring 1967, lecture 6, p. 5:

"Let's look again at the language here. 'Jim, this is Al, Ken, and Roger' says *Dan*. It's in its fashion a terribly interesting piece of talk. The first thing you want to notice is, it's one sentence in which room is apparently left for insertions of greetings by the various parties introduced."

   Spring 1966, lecture 04.a, p. 285:

   "Let's look again at the language here. 'Jim, this is Al, Ken, and Roger' says *the therapist*. In its fashion it's a terribly interesting piece of talk. The first thing you want to notice is, it's one sentence in which room is apparently left for insertions of greetings by the various parties introduced."

(3)   Excerpt from Fall 1966 – no discussion in Spring 1967

Fall 1966 lecture 1, p. 4:

"He knows *the therapist* as Dr so-and-so, probably. That is to say, in the prior company in which he's spoken to *the therapist*, say with his parents or whatever else, that is presumably the way they've talked. And in any event, it may well be an issue as to how it is that he's going to address *the therapist* . . . "

Spring 1967 (no such discussion)

Spring 1966, lecture 04.a, p. 285:

"He probably knows *the therapist* as Dr so-and-so. That is to say, in the prior company in which he's spoken to *the therapist*, say, with his parents or whatever else, presumably that is the way they've talked. And in any event it may well be an issue as to how it is that he's going to address *the therapist* . . ."

(4)   Excerpt from Fall 1966, pronominal changed to categorial

Fall 1966, lecture 1, p. 3:

"So that the fact of a first name, nickname, being used throughout, can be in the first place quite informative, and even more informative if differences are involved, i.e., if *he'd* said 'Jim, this is Al, that's Mr so-and-so, and this is Roger'."

Spring 1967, lecture 7, pp. 7–8:

"As it happens, just as the order of introductions related to the ecology of the room or whatever else, can be used to make distinctive points about the group or not make any points about the group, so too can the sorts of name used do the same kinds of work, in combination or independently, i.e., *they* could go through this sequence and say, instead of 'Ken,' 'Kenneth Goss,' 'Mr Kenneth Goss,' while saying also, 'Roger, Al, and Jim'."

Spring 1966, lecture 04.a, p. 284:

"So that the fact of a first name, nickname, etc., being used throughout the sequence can be quite informative, and it can be even more informative if differences are involved, i.e., if *the therapist* had said 'Jim, this is Al, that's Mr Kenneth Goss, and this is Roger'."

(5)   Excerpt from Spring 1967, pronominal changed to categorial

Fall 1966 (no such discussion)

Spring 1967, lecture 6, p. 8:

"If, given something that can come in sequences, a first has been seen and oriented to, then a second can be done observably without using that form which would be required for a first. That is to say, if *he* had simply said 'Ken' as a first, then what he was doing would not be clearly an introduction."

Spring 1966, lecture 04.a, p. 287:

"If, given something that can come in sequences, a 'first' has been seen and oriented to, then a 'second' can be done observably, without using that form which would be required for a 'first.' That is to say, if *the therapist* had simply said 'Ken,' as a first, then what he was doing would not at all be clearly an 'introduction'."

(6) Spring 1967's 'Dan' changed to 'the therapist'

Fall 1966, lecture 1, p. 1 (no such reference)

Spring 1967, lecture 6, p. 2:

" . . . i.e., the seating is arranged as follows: [*Diagram with names: Dan*, Al, Ken, Roger, Jim]. If *Dan* begins with Al . . . "

Spring 1966, lecture 04.a, p. 282:

"That is, the seating is arranged in a rough semicircle with *the therapist* closest to the door, then Al, then Ken, then Roger. When Jim is introduced, he is standing near the door. If *the therapist* begins with Al . . . "

(7) Spring 1967's 'Dan' changed to 'the therapist'

Fall 1966 (no such discussion)

Spring 1967, lecture 6, p. 4:

"One wants also to see that it may well be that adequate decisions could be made as to what *Dan* is doing with that sequence, with only that sequence available."

Spring 1966, lecture 04.a, p. 283:

"One wants also to see that it may well be that adequate decisions could be made as to what *the therapist* is doing with that sequence, with only that sequence available."

(8) Spring 1967's 'Dan' changed to 'the therapist'

Fall 1966, lecture 1, p. 7 (no reference term):

"There's one absence of a 'hi,' and I really can't say whether it's an absence of a greeting, since it's perfectly alright to have no sounds in a greeting, but things like a nod, etc."

Spring 1967, lecture 6, p. 7:

"Al doesn't say 'Hi.' I'm not sure whether he did some greeting, e.g., by nodding, waving, etc., or just didn't do a greeting, and was treated as having had his time passed by *Dan*, who just went one. Rather than say, waiting Al out."

Spring 1966, lecture 04.a, p. 286:

> "Now Al doesn't say 'Hi'. I'm not sure whether he did some greeting, e.g., by nodding, waving, etc., or just didn't do a greeting and was treated as having his time passed by *the therapist* who just went on, rather than, say, waiting Al out."

Of the eight segments in which this speaker is referred to by category in the edited version, only one of them, segment 3, reflects categorial reference in the unedited version from which it was excerpted. All the others are shifts from 'Dan' (segments 1, 2, 6, 7, and 8) or 'he' (segments 4 and 5) to 'the therapist.'

Part IV
Winter 1967

February 16

Omnirelevant devices; Settinged activities; 'Indicator terms'

I want to focus on some stuff to try to exhibit some ways of proceeding. Let me begin with how the problem I'm going to deal with comes up. I faced the following kind of problem: I wanted to propose that the membership categorization device 'patient–therapist' is *omnirelevant* for the session that I'm analyzing. And I wanted to find out how I could go about showing that it's omnirelevant.

One obvious way of proceeding turns on formulating the session as a 'group therapy session.' Now that, conservatively, is to say at least that 'group therapy session' is an omnirelevant formulation of this session. That is, 'group therapy session' is *a* formulation, which has, proposedly, omnirelevance. And it would be in terms of that, that we could formulate the omnirelevance of patient–therapist. Where we could suppose, for example, that it might well be the case that not only would there be other possible formulations at some time of membership categories for the session, but there would be other possible formulations than 'group therapy session.' And of course, that the various 'types' might stand one to another in some relationship, i.e., that when 'group therapy session' were relevant as a way of formulating what's taking place, so, too, might be patient–therapist, etc.

So I wanted to be able to formulate the fact that one way of conceiving the setting – to be sure, one omnirelevant way – was as a 'group therapy session.'

That led me to notice two kinds of things very directly. One is that of course we're talking about formulating the setting as a such-and-such, i.e., 'group therapy session.' The other, that formulating it as a such-and-such was something that participants occasionally did. When? Why? And with what kind of consequences?

Running along with that is, of course, an issue which we should like to get into position to raise and deal with: Have we any special rights to assign name-formulations to the actions, upon, say, occasions when they are *not* assigned by participants? Can we construct rules for doing formulating – generally, and then for doing specific formulating, i.e., saying it's a 'group therapy session,' for example. What does that hold for?

So the issue of formulating comes up. And then, since I'm talking about a possible omnirelevant formulation of the setting, and thereby of course quite directly of other possible formulations of the setting, one gets led to

---

Only three lectures were transcribed in the Winter 1967 quarter.

considering a question like this: Can you talk about a setting without a formulation of the setting? We can translate that somewhat by saying: Are there ways that persons have of attending and, for that matter, *doing* the fact that their activities are 'settinged,' without making specific formulations of the setting, i.e., selecting *a* formulation, or selecting a formulation and then later selecting another? We could put it this way: Is it possibly the case that, first, the phenomenon of a 'setting' needs be recognized as also a Members' phenomenon, and not, for example, one of those things which, as social scientists, we construct and manage? And if so, then we have got to find out what kind of a thing it is that they're doing with it – what kind of a thing it is.

And, if they have a phenomenon of 'setting,' and a setting can be formulated in one or another ways, then it fairly rapidly seems obvious that it would be extremely nice if Members could invoke – let's call it 'the pure fact of settinged activities,' without having to formulate *a* setting. There are a variety of reasons why that would be nice. One way to put the core of it is: Members can't do pure formulating. That is to say, you can't be engaged in 'merely' – non-consequentially, non-methodically, non-alternatively – saying 'This is, after all, a group therapy session.' To do that – even though you're merely invoking one thing that's true about this – is to do other things as well, e.g., put somebody down for something they just said, propose special relevancies, propose that some topic ought to be discussed or not be discussed, invoke a status hierarchy, etc. At any rate, in each case that a formulation of a setting, or an identity, is done, that's something that has some line of consequences, and some analyzable basis, for participants, which can be one differentiated from another possible formulation, and also from not doing it at all.

I have now and again proposed that there's no room in the world to, in principle, use a procedure of requested explication to find out what somebody is doing. There's no room in conversation for such a procedure to, in general, work. You can ask somebody "What do you mean?" and they may well tell you what they mean. But what I mean by 'in principle' is that if you say to somebody "What do you mean?" they can say "What do you mean what do I mean?" and you're off.

I think in parallel to that it's also the case that there's no room in the world to definitively propose formulations of activities, identifications, and settings. They are things that have got to be used with caution. And there may well be ways of allowing things to go on without their necessary invocation.

I am not engaged in saying that it's a specific trouble in the world that you can't find out what any given person means on any last thing they said, by, for each piece of talk, using such a procedure. All I mean by that is to say that insofar as such procedures are suggested to be definitive of, say, 'meaningful talk,' they're wrong. That is to say, 'meaningful talk' cannot have that sense. Which is either to say that talk is not meaningful unless we construct a language which is subject to such procedures, or, that couldn't be what 'meaningful talk' is. Or 'meaningful actions.' I am not saying that there are defects to the way people proceed, but that if we're going to suppose that in

order for persons to behave in an orderly fashion, say, in the course of their conversations or in the course of any of their activities, one set of things that have to be involved is that they're always able, say, to formulate their role relationships and systematically invoke their consequences, then we'd be wrong.

And of course that's something that, for example sociologists might take to be the way of talking about orderly rule-governed activity in stratified society, say. Or in societies in which there are more than one role relationship. So that persons shift, and it would be necessary for them to know, and be able to invoke at any point, which one is now operating. If it's the case that there's no room in the world for that, then either orderly activity is impossible, or that requirement for orderly activity is irrelevant or absurd or wrong. That is, there may be ways of invoking orderliness of activities, say, without having to formulate what the terms are of that orderliness, i.e., without having to say who you are and who I am for now, or what we're really doing for now.

I wanted, then, to see whether there were ways of invoking the fact that activities were 'settinged,' without making *a* formulation of the setting that they were 'settinged' in. I wanted then to see whether it was the case that there was some specific machinery the working of which involved that you could invoke the fact of settings without formulating *which* setting *now*.

Now let's hold all that discussion for the moment, and turn to a body of problematic phenomena. These are 'indicator terms.' For our purposes now, the 'indicator terms' need only be considered things like 'here,' 'now,' 'there,' 'later,' 'soon,' 'this,' 'that,' etc. As an initial source book for consideration of them, there is Quine's *Word and Object*, in which he cites much of the earlier literature, particularly Goodman, *Structure of Appearance* and Peirce, volume II of his *Collected Papers*. Peirce is a modern logician who initially began to talk about those terms.

While a lot of talk about these terms is by logicians, and the indicators are said to pose logical problems more specially than other things, it's important to notice at the outset that the indicators are noticed via conceptions of their reference and meaning. So, for example, Peirce, talking about 'indices,' says that they are things that instruct you to look for some object which is being pointed to by reference to the use of one of those things.

Now, the first big important property of the 'indicator terms' is that they are indeed referential terms. And second, that given any first use – in a sentence, say – no second use needs have 'the same' reference as the first. That is, there's no reason to suppose that any token has the same reference as any other token. For example, in some conversation where somebody says "I went to the movies" and then somebody else says "I stayed home," the two indicators, 'I,' have two different references. That's the kind of thing that we are in the first instance pointing to.

The reason that the logicians are discussing these issues of different reference turns on their interest in the 'truth' of sentences including them. So, for example, Goodman gives as an instance, a sentence like "The Red Sox are in first place now," which can be true at some time, he says, and false at

another. The introduction of the notion that no second use need have the same reference as the first, raises such issues as the constraints under which you can say that, say, a sentence or a token of a sentence, having one of these terms, can be true or false. Where what one wants, ideally for doing logic, is not to have to be worried about the tokens of sentences, but to be able to make statements that are true or false for the 'sentence type' without regard to the occasion of its use. That is, "Ice floats on water" is true, any token of it is true on any occasion of use – and you can forget about tokens, as a matter of fact. For "The Red Sox are in first place now," it's not the same sort of thing.

It ought to be noticed – and indeed later into his discussion Goodman does notice in a fashion – that there's ways in which the proposal that "The Red Sox are in first place now" can be true, is quite misleading. And Quine, in his discussion of 'this,' leads us into the way in which it's misleading. He says something like, "When somebody says 'this' it can have clear reference by virtue, say, of an object standing out in its environment. So when I point to 'this,' one can find which object I'm talking about."

The core thing about both of those in a way, is that they're concerned to find, for the indicators, a formulation of 'some object,' 'some time,' etc., where, that the use of the indicator in its sentence *intends* such a formulation goes without saying. And that whole business was exploded by Wittgenstein. When talking about that sort of stuff he says something like, "If I point to something and say 'this,' how are you supposed to decide that I'm talking about the nameable object, its color, this side of it, its depth, whatever else?" That is to say, the very order of phenomenon being invoked by the indicator, is not invoked by the indicator. So that, for example, we could complain to Goodman about "The Red Sox are in first place now" by saying, "Well, only really partly 'now' are they in first place. For example, to be sure today they're in first place, but we have to choose an order of temporal terms to decide what 'now' they're in first place for. In terms of, say, a 'now' which is used with respect to 'this year' it's only true that for a small part of it is it so that 'The Red Sox are in first place' is true."

In that regard, then, we might be involved in saying that one would at least need to formulate the order of aspects that the indicator was invoking. But then, of course, we might ask whether in *any* event the indicators are doing such sort of reference as is characterized by our normally referential terms, i.e., whether the way to see what somebody is saying when they say "The Red Sox are in first place now" is to rewrite it as: "The Red Sox are in first place on July 21, 1953," or whether perhaps they're doing something at least partially different when they use indicator terms.

The issue of having to decide – if one is going to determine, say, the truth of a term like 'now' or 'here' – what in the first instance it's referring to, has a kind of problem with it, since each formulation may well be consequential. That is, if, e.g., 'here' is 'the group therapy session,' there might be good reason for wanting to say, e.g., "Usually there's a broad in here" or "What are you doing here?" rather than saying "Usually there's a broad at our group

therapy sessions" or "What are you doing in group therapy?"

There are other things that we can begin to notice when we look at the use of these things. For one, that it's kind of obvious that the distinction between temporal and spatial indicators is weak. If we were going to make some interpretation of "Usually there's a broad in here," presumably it means 'When we are here usually there's a broad here.' And time terms can have a spatial sense, also. That is, when the kids say 'what we did last week;' for example, "You were hysterical last week," they seem to be meaning 'at last week's session here.' Not last week, but for the two hours we met, and in this place.

So, there are ways in which the spatial indicators invoke time and the temporal indicators invoke space as well. And furthermore, again, they may not invoke those things in a way that is non-consequentially formulatable. When one considers these, and some of the other things I've so far said, the idea that these terms are, in the first instance, directed to doing individual reference – in the sense that, say, 'chair' refers to a chair, etc. – is at least open to reconsideration. So that our aim, in characterizing how they work, might not be to try to find the ways in which they're versions of referential terms, such that the sentences in which they occur can be fiddled around with so as to find that they are referential sentences, and thereby at least sometimes true. Let's forget about that for now.

But let's preserve a first point, anyway: That for all anybody knows, any next use of one of them will have, say, little to do with the last use. And then consider the following: What if it turns out that in great big blocks of them, they seem to be stable? That is to say, that people can be producing strings of talk in which, say, 'here' is occurring, and in which there seem to be no question about what it means, and it seems to be invoking something extremely similar across its uses, whatever that may be.

It is of course an important question: How can we say that the use of these terms may be stable, without having some way of assigning their meaning to them; their meaning then being a formulation of what they refer to – assuming that they have that kind of reference. That is to say, we do it for the pronouns doing tying, by virtue of running backwards to find a noun that the set of them are chained to. So if we have a theoretically possible chain of indicator terms, then how are we going to say that they're a stable chain, or that they're a chain at all? Now that's a real problem. And it's clear that we want to avoid the circularity of saying, 'Well they're a chain, and no problem seems to be arising from them, so they must be a chain;' where the issue is, since there isn't especial regulation, perhaps, on a next use being chained to a last use, why call them a 'chain'?

Let's just consider data like:

Louise :   Oh, he could be HERE just to spend his father's money.
Roger :   Maybe that's it.
Ken :   I don't think his father's paying for THIS is he Al?
Al :   No, not THIS PLACE.

.
.

Louise: Who's paying for THIS for you? His // father?
Ken: Who's payin' – No who's payin' for THIS // for *me*.
Roger: Now I'm gonna make you all mad. I don't pay at all. hehhehh
Ken: Ahh– I don't know who's payin' for THIS, I think it's my father. I hope.

It would appear in the first instance that 'this' in "paying for this" throughout that string is, in each case, related to the last case. Now in a situation like that, we might use the notion of a 'round' to begin to get some basis for treating the uses of, say, 'this' as stable there, without having to say in any of those cases that in the first instance 'this' is equivalent to, say, 'therapy.'

What we want is to be able to have some way of formulating what I take it is observable. And that is, the stability of the term 'this' across that body of talk. We want to be able to do that without having to say that each of those cases of 'this' equals 'therapy' so that each of those sentences could be written as 'paying for therapy.' One obvious reason for not wanting to do that is they could perfectly well *say* 'paying for therapy,' and on some occasions they talk about 'therapy.' and we don't know what are the ways, and the rules, and the occasions for doing formulating. And, again, it may well be that there are ways of invoking and maintaining a stability without making formulations.

Now what you get when you look at the run of our data is, first, that there's an enormous, by and large unquestioned, usage of the indicators. They are altogether 'abstract,' i.e., 'here and now' is usable on any here and now without reference to the fact that it's late at night, early in the morning, in 1950 or whatever else, and without, of course, formulation of whether 'here and now' means in this room now at this moment, here in this world now in this eon. Given their abstractness, if any set of terms could be capable of invoking the sheer fact of the setting without the specification of the setting, it would obviously be these.

And then, if they had some business like that, there would of course be no reason at all to treat them as 'the way that people with small vocabularies talk about specific objects.'

And furthermore, their stable use as a means of invoking an unformulated setting, and referring to uncategorially identified persons, and noticing uncategorized activities, could be their specific business, and a machinery for doing this piece of work. It is, in a way, an expectable piece of work to exist, and one that the indicators can be seen as designed to be able to handle, insofar as everybody plays along. That, in any event, is my guess about these things, and about how one goes about formulating that there is a setting, that we are indeed in a setting, doing a setting. It is a matter which others can also acknowledge for you, which can occasionally be formulated, but can have its course of activities proceed without formulation.

There's a bunch of things that this kind of thing can do for us, were it to

be so. One of them is that it would be an obvious way of showing that persons had and used the notion of 'a setting,' i.e., that the language was designed to allow them to do it – that these poor terms which have been subject to such abuse were not what they've been made out to be, and thereby made to be subject to such abuse. And it has the virtue at this point of permitting us to see another layer of the world – or it gives me that feeling, anyway. If anything like it is at all conceivable, then it does provide strong reasons why we should not be engaged in proposing rewritings or proposing formulations as the ways that persons go about making the world orderly, or referring to it, or invoking it, when they don't do that on some occasions – at least out loud. It may well be that many times they go about interpreting those terms for themselves. But that they don't need to do it out loud can be quite nice; where, then, perhaps insofar as things become troublesome, they may well have to get into formulation.

What we've seen in a way, is a consideration of the import of the fact that when it comes down to having to do formulation, there will not be definitive ways, non-consequential ways, of doing it. As we go about constructing the methodology of any given activity, we will come to find that the method is able to produce a thing that is seeable as 'an alternative.' And my guess is that we'll never get a stable formulation in which these things stand one to one – and if they had to stand one to one, then there would be an enormous mess.

Again, then, what I want to be able to say is that there can be ways of invoking the fact of a setting, and a bunch of its features – whatever the features are of settings – without any specification of *which* formulation of the setting, *which* formulation of participants, being involved.

One wants, then, to be able to see what is involved in, say, the settinged character of activities, so as to see, e.g., that there may be things about many or any settinged activities which are doable in *each*. So that, for example, in this session, and perhaps in any conversations that go on in sessions, there's talk of things like 'early,' 'late,' 'middle,' and things like that, as ways of handling them.

Those sets of terms and those usabilities are specifically features of settinged events. In any given setting the notion of what's early and what's late, what's the middle, what's usually, what's always, what's last time, may be – in terms of when it is that they get invoked – quite different. But the fact that they're present, and can be present without specification, furthermore, are things that we can now begin to focus on as ways that persons are ordering the activities they're dealing with, via what I call an 'abstract apparatus,' i.e., that whatever the setting's calendrical features are, there could be a way of talking about, say, 'early' in it.

One of the things that I expect to happen is, it's not simply that you invoke a setting, but one of the ways that you *make* a setting out of some course of activities, is by beginning to develop things like time in it; and that involves being able to coherently use things like 'early,' 'late,' etc. And furthermore, you find that generic explanations of things like 'Why is X late *here*?' are

available. That is to say, whatever explanations people use for saying 'Why X is late' without respect to setting, can be used. And, without regard to what happens to be the explanation of it, it will be the case that it's noticeable that X is late, and that 'Why is X late?' can be asked. The matter of space in the place is, of course, another thing, and, at least within this culture, things that arise, arise within 'this room' or arise in 'other rooms;' there are battles over who's chair is which, and things like that. And there's talk of territorial rights, territorial distribution, etc., which can apparently go on in a room as well as in anything else formulatable as a 'setting,' perhaps. Histories are developed. So the idea is that whenever people can set up and maintain the fact of a setting, there's an enormous amount that they can get going for them.

One of the things we want to move to, as an ultimately interesting thing is – let me put it this way: You could imagine that everybody who isn't in the jet set would find the world boring. And, to be sure, some people who aren't in the jet set find the world boring. But it's apparently the case that you don't have to be in the Pentagon Chart Room all the time to find that the world is full of interesting things to do, to see, talk about, notice, consider, explain, etc. And a group of four kids who get together for two hours Saturday mornings, among other things that they do, find that adequate. And whatever they know about the world, whatever formulations of its units, participants, etc., can be used there. What we'd like to come to see, then, is that in that sense, all settings are equivalent; whatever you can do in one, you can, in some sense, do in others.

March 2

Turn-taking; Collaborative utterances via appendor questions; Instructions; Directed utterances

I want to consider the issue of features, properties, of *multi-party conversations*. What I especially want to arrive at, if possible, is that one could feel that they could come to see the way in which 'multi-party conversation' is a distinct phenomenon; and order of facts; something to be investigated in its own terms, and not merely – as I think a good deal of my discussions of that phenomenon treated it – as a variant *off* two-party conversation.

Now one might figure that they have some features of multi-party conversations which suffice to make it an area of research. And these could be considered, to see not only whether they are indeed features of multi-party conversation, but whether, upon seeing them, you could rightly figure, 'Well, this is a real thing, multi-party conversation, that has to be studied, and whatever is going on in it has to be worked out,' and it isn't simply that one can contrast it, say, to two-party, i.e., a list of features to be arrived at by virtue of two-party, to be checked out as to whether they also hold for multi-party or not, etc.

Such a feeling might be attacked, and rightly so. But there are times when you ought to have such a feeling. That is to say, you may well have made a finding, but you didn't see what its import was. That's extremely important, and it's by no means coincidental with having seen that something was so. What you want to ask, in part, is, if that's so, what it does for whatever formulations you may have made of the thing you figured you were studying.

I'll begin by just saying a couple of the things that were in the first instance my grounds for looking at 'multi-party conversation' as something to be named. That is to say, it could perfectly well be the case that there were three persons present or seven persons present at a conversation, and you wouldn't have any reason to construct a new name. We had in the first instance this A-B-A-B formula for the course of two-party conversations, as a sequencing formula which had some consequences – not on its own, but in a combination with a variety of other things; sequencing rules, ways of detecting the completion of a type of utterance, etc. The multi-party conversation phenomenon was forced upon me in the first instance by virtue of the fact that it didn't appear that the formula for two-party conversations, A-B-A-B, was a special case of a general formula for n-party conversation such that A-B-C-

A-B-C, A-B-C-D-A-B-C-D, etc., were formulae for multi-party conversation.

The question was, then, were there some general sequencing rules for assigning speakers in conversations of other than two parties – using, now, the fact that 'two parties' doesn't mean necessarily two persons. And I began to collect features of multi-party conversation, without regard to whether any of these features might, if sufficiently considered, lead us to see the ways in which multi-party conversations are something to be considered independently of two-party conversations. The features that I came up with didn't so lead me, anyway.

There was, however, some idea that came up, turning on things like the phenomenon of 'the floor,' which became especially problematic in multi-party conversations. And that is, if four or more persons were present, you could have different conversations being set up so that what may remain a general rule for n-party conversations – one person properly talks at a time – was something that could be equivocal, in the sense that if two persons were talking at the same time, it could mean either that a violation of 'one party at a time' was taking place, or that a second conversation was emerging, or, for the moment, competing.

When I say 'one party talks at a time' is a rule for conversation, I'm just pointing out something that I suppose is, in a fashion, known. I am pointing it out, not for that 'message,' but for the observations it leads to. And of course 'one party talks at a time' doesn't mean that you never find more than one party talking at a time. Somebody once said to me that they found people who violated the A-B-A-B rules, as if that were something that ought to be enormously shocking as a fact. That is, as if, in fact, A-B-A-B would characterize any two-party conversation as a natural law, rather than that it was something that persons attended and used in various ways, and something that, in combination with other things, could tell people that, and *when*, it's their turn to speak. And also, that its use permitted such things as the work of A-A-B, i.e., a repetition which says 'you should talk.'

It is, of course, the case that a good deal of the time one party only is talking, the other party is listening. And by and large, rules for talk in conversation are sequencing rules. And those sequencing rules are rules that operate on completions. It is not the case that if 'one party talks at a time' is a rule, that, for example, thereby its affiliated rules provide that you can talk interstitially in the words of another. That is, you could imagine talk being 'one party talks at a time' and it having the character of certain kinds of music, in which the spaces between the talk of one party would be the place of another. That could be a 'one party talks at a time' situation also. Here, we have 'one party talks at a time' with sequencing as a crucial kind of thing. And the sequencing turns on completions. That means, then, that there is an orientation to when a party will have been complete, as a point that others can talk. So what we get to is the kind of other rules that might follow given the first, and then, of course, the combinations. 'One party at a time' and 'sequencing' is an affiliated set of rules.

Given the orientation to sequential talk and completion, we can notice something which it's nice to be able to make problematic and then to be able to get some grip on solving: If a notion of completion is used as the touch-off for a next party's talk, then the question is, how is it that a party can decide that another has completed an utterance?

What's interesting there is, in part, *when* can a party decide when another party is complete? And how do they go about doing that? You could imagine that, e.g., when another party pauses for a certain length of time, then the utterance is complete. That would involve listening to them, and then beginning to measure pauses whenever they seemed to be countable. Now it doesn't seem that they proceed that way. One of the striking things about ordinary conversations is the enormous speed at which a person who has been a listener starts to talk, upon what is recognizable as 'a completion' by the person who has just been talking. That is to say, we seem to have a person being able to attend the fact that an utterance is going to be completed soon. And to treat some word or phrase as recognizably 'its completion' when it occurs. Now how they do that would seem obviously to turn on their use of a grammar. That is, grammar has a structure that is usable, while it's being produced, so as to see 'completion is coming,' 'that's completion.' And thereby the key thing is that a completion can be recognized *at* its occurrence, permitting, then, talk to start right off. One doesn't wait to see afterwards.

So they start talking awfully fast. They're not wrong, by and large, it appears, about the fact that the other person had finished. This also permits us to see that there are a class of what we could call 'interruptions' which are quite rightful if such a procedure is properly used, i.e., if one can talk on completion. And that would turn on the fact that persons do what hearers properly recognize to be completions, but continue then – or want to continue then.

That is to say, there will be places where, if you look at where interruptions occur in conversation, you'll find that they don't occur randomly. By that I don't mean that you'll right off get a direct pattern. But you can begin to pick out of a collection of interruptions, a series of different orders to them. There will be a bunch of interruptions which occur, and which you pick up as 'interruptions' by virtue of the fact that two parties are indeed talking, where what happens is that you have, for one, an adequate grammatical production by one party, the start of talk at its completion, and the continuation by the first party. As compared to that interruption occurring, say, in the middle, i.e., anywhere along in the grammatical structure of that other utterance. They occur right at the beginning of utterances, also, but that's a different thing, and we'll consider that eventually.

It isn't the case, then, that I'm saying that interruptions will only occur on completions. What I'm saying, by 'not random' is, not that they have only this organization, but that each class can perhaps be separated out and considered by itself. Especially when you consider the types of interruption. An interruption occurring at the possible grammatical close of an utterance will have quite a different character than an interruption occurring at the

beginning. For one, you can see that the party is intending to talk *after* the first in the former; it may be found that the second utterance is tied to the first, and may even be addressed to the first.

So there's this sequencing phenomenon, given 'one party talks at a time,' which permits us to focus on those places where *which* party *now* comes to be an issue. It also permits us to see the spacing that's involved, and the spacing, which is small, nevertheless preserves 'one party at a time.' It isn't the case that talk happens to be distributed so that more or less one party is talking at a time. But they're making it their business to have it that one party is talking at a time. This one begins when he figures that one is finished.

One of the consequences of 'one party talks at a time' gets kind of nice when you begin to play around with it. And that is, it's pretty regularly the case, with very few exceptions – in principle with few exceptions – that if two parties are talking at a time; that is, if it happens that they find themselves talking together, then one person will stop in a quite distinctive way. They will stop without completing the utterance they began. That is, they will produce an utterance which is, which respect to its end, 'ungrammatical.' Where, then, somebody might say, 'Look, there are two parties talking at a time, so what are you talking about?,' when two parties are talking at a time you do find that most of the time they do not bring their utterances to an orderly completion, and indeed mark that they interrupted, or that they've been interrupted, by stopping. And that, of course, brings an obvious fact, which is that it's impossible to violate, on your own, 'one party talks at a time.' That is, the other party has to go along with you to have an extended violation of 'one party talks at a time.' What *is* possible is that if you decide to violate that rule the other person won't let you. They'll stop and let you talk.

I say 'by and large' only because there are people whom you might encounter who never seem to attend that rule very much, and they produce utterances across your own, say. And, at least in orderly conversations with them, you get people figuring that 'I've been talking and I've been interrupted, and it's the business of the party who does the interruption to stop, and this interrupter will surely recognize that he has interrupted me.' So you can get, even in two-party conversations, people talking in through-complete utterances. But even there, you will find that the breaks in one or another's utterance will not be at the end of sentences.

So the virtue of this very bland, obvious rule, 'one party talks at a time,' is that it will permit us to see things going on in conversation. It will permit us to see, e.g., when two parties talk at a time, one of them stops before he's finished – where by 'before he's finished' I mean in the course of some so-far grammatical utterance, he makes it ungrammatical by ending before it is completed as a sentence. That is a fact we can come to observe; and indeed it occurs. There are, of course, other things that are found, which will be added to 'one party at a time.'

Now, one thing that seems to be involved in multi-party conversation – and I haven't begun to work on the differences between three, four, five; I'm

sure there are some nice things that might be differentiated, but I'm not now making any differentiations – one general issue, clearly enough in such conversations, since it's not solved given that there's no formula, is: How is it that who speaks next is regulated? Are there any regulations? It would appear to be the case that one possibility is that a given speaker has the right to choose a next speaker. That that's possible turns, in part, on the fact that utterances may be directed to specific people, and sequential-type utterances (which are artifacts of two-party conversations, in part), like a question directed to A (which, in a two-party conversation would obviously be directed to A since he's the only other person there), are usable in multi-party conversation. And there are, then, a bunch of ways that a given party can provide who should speak next. And if that is about the size of the rules for choosing next speakers it means that, for one, a given party can't choose next-next. That is, if the rules hold such that he can choose next, then the one he chooses can choose their next, and if that is so, then a given party doesn't control the 'speaker after next.'

It's perfectly clear, of course, that a lot of choosing of next parties goes on in multi-party conversation. And when you consider that such a usable rule exists, you get a grip on another interruption phenomenon which is kind of interesting also. Now I think – I can't really swear to it because it is the kind of thing that needs an analysis using larger bodies of data than I tend to use, but it's my suspicion that in multi-party conversations you get a lot of interruptions of the following sort: An utterance is coming to completion (and we're dealing here with 'recognizable grammatical completion'). The next party starts to talk before it's completed. Is there some reason why that should occur? In part, it seems to turn on the following combination of things: First of all, it appears that if a given speaker does not direct an utterance to somebody, i.e., leaves it open as to who should speak next, then speakers can opt for who's to speak next. And secondly, it's apparently the case that first starter goes. That means that persons who want to speak next are going to attend carefully when an utterance has been completed. Now there could be a situation where it wouldn't really matter that you won or not, if we had this sort of thing: If you came second in that race, so to speak, then you got a chance to speak after the person who beat you out. There isn't such a rule, and furthermore there is this rule that the person who's currently speaking can choose the next speaker. Which means, of course, that the person who beats you out can choose a next speaker other than yourself, ad infinitum. If, then, you lose any given race – supposing it's a competition – there's no guarantee when you will next get a chance to talk, i.e., when you will in fact beat somebody out, or be selected to talk.

Now that sort of combination, further combined with other ways that utterances get tied together, and given the structure of conversation, means that if you had something to say at point X, then it could very shortly be that you would have to say something very different, to be saying something understandably. And it wouldn't do to interrupt right in the middle. Because that would be merely an 'interruption,' which, since the other party clearly

has not completed, there is no reason for them to stop, and it's your business to stop. But we could expect that there would be an edging up on parties now talking. Especially where the utterance they were producing did not seem to be a directed utterance. And you can very frequently tell that it's not directed, though they might at the end put in some directing to it. It might be interesting to see if non-directed utterances were interrupted towards closing with some orderliness to that occurrence. If so, then that collection of facts, which anyway are somewhat operative, might be seen to be combinably providing for such an occurrence.

In fact, most of the investigation of multi-party conversation that I engaged in for a while was concerned with sequencing the ways that parties would go about maintaining 'one party at a time,' and the various kind of 'ordinary,' i.e., two-party sequencing devices, that were used to, say, direct an utterance to somebody else, or to provide that some other person who wasn't directed to speak, if they spoke, would speak in a certain way. So, for example, a question might be done, and not addressed to anybody. That means if nobody answers it, it's no particular person's failure to answer it. *And*, we find that while it may be nobody's business to do an answer, persons who speak next very heavily do an answer. So that there's a separation of the two-party situation where, say, a question first provides the occasion for the other party to talk, and also provides what they ought to do, i.e., produce an answer. In the multi-party situation, with non-directed questions, it's no particular person's business to answer it, and nonetheless it's treated as sequentially relevant for *whoever* happens to talk next.

And of course also the specific issue of how utterances are made directed to other particular parties is a real phenomenon in multi-party conversations. It's no problem in two-party conversations; every utterance is directed to the other. In multi-party conversations, insofar as directedness is an issue with regard to sequencing, there are a large store of techniques whereby persons go about making directed utterances. Obvious ones are, of course, "Well John, what do you think?" There are some quite nice ones. I'll talk a bit about one I came across yesterday.

I am much interested in collaborative utterances. In the course of studying those things I've been looking at a type of collaborative which I talk about as 'appendors.' They work in the following way: Some person A, introduces a sentence. B treats that as an independent clause and builds, say, a question which is of itself grammatically incomplete, but which, if seen as the dependent clause to an independent clause, is okay, with one possible variation on being okay, and that is that if the first utterance had a pronoun like 'I' in it, then the appendor has a pronoun like 'you' in it:

A: I'm about to drown.
B: In your own humility?

That's a typical appendor. The second utterance clearly is not a sentence of its own.

Appendor questions are a very characteristic kind of thing, and what they do is, they are specific ways of doing directed talk. One thing an appendor question does clearly is provide that that question is directed to the speaker of the utterance to which it is appended. One thing it does in doing a question in this appendor fashion is to select the person who will answer the question.

And a thing I've talked about elsewhere is the general problem of instructions directed to parties other than those being specifically instructed. That is, a thing like "What do you think, John?" may be directly instructing John to say something, and presumably the speaker of it will allow John to say something. In a multi-party situation it is also in some way instructing various other persons to shut up for some period of time. The structure of those kinds of utterances is a fundamental kind of issue, and especially in the case of non-obvious directedness, that parties are indeed seeing that they are being instructed, in what ways, and with what effectiveness, are fundamental problems.

For such situations, instructions in instruction manuals are typically very uninformative, since they normally work to simply instruct the various parties who are about to do something, e.g., a host should greet a newly entered person. That means that all the parties present have got to analyze out of it who the 'host' is, and if there is no 'host,' who is it that is 'like a host'? Some of them shut up, another sees that he's the host and what he ought to do. All that being done with some speed, and all of it necessary for a connection like introducing a new member to a group, to come off with the right party doing the right thing and everybody else shutting up and allowing it to be done – and indeed perhaps collaborating in its being done. Now instructions in the etiquette books don't tell you how you locate who is 'like a host' if there's no obvious host, or how it is that the other parties to such a scene ought to behave. The problem, then, of rewriting instructions to handle these sorts of situations is obviously an altogether fundamental one.

Here is the piece of data. A conversation is going along, then Ken whispers something to Al and Roger, and this goes on for a little bit. Then:

Ther:	Ken, why don't you make these arrangements out of here.
Ken:	Oh.
Al:	Yes, Teacher.
Ther:	Is that what I sounded like (for a moment)?
Al:	(Yes) Teacher.
Ther:	What'd it make you feel like?
Roger:	Like it reminded us that // we're in group ther–
Al:	I felt like // ( )
Ken:	Back in school.
Ther:	Would you like to hit me?
Roger:	You reminded us that you're in group therapy. hehh

Just to get into what's involved: Here's a remark addressed to Ken by the therapist. A reprimand of sorts. And Al responds "Yes, Teacher" and then

Roger says "Like it reminded us that we're in group ther–." Now most of the time that I've been talking about activities in conversation in general, I've been talking about things like 'insults,' 'invitations,' etc., A to B, B to A. Now here's a situation in which T reprimands K, and that reminds A and R of something. That is, T is doing something, not only to the person to whom he addresses his remark, but to the others. Something different, also.

Now forgetting about 'reprimands' and the things that they involve in particular, what we have in the multi-party situation is, it's not at all completely analyzed when one has focussed on that activity or that set of activities that the speaker is doing to whomever he happens to direct his utterance. We have things like: A directs an utterance to B which has as its point that he's doing something to C, also present; something other than he's doing to B. What we get, then, is that the multi-party situation is one where we're dealing with the relationship of activities – not sequentially, not the blocks I talk about, not that sort of orderliness – but across the parties present, given an activity being done directed to some person. Focussing on that activity alone is not by any means a complete analysis. It can be for two-party conversation, i.e., whatever A does to B is what A is doing. In a multi-party conversation, whatever A does to B, assuming A is addressing B, is by no means all that he is doing. One has instead to work out how it is that the various parties present are seeing what's being done – not only what's being done to B, but what's being done to them. So as to see, for example, what they may then come to do. As in this case they take it that the reprimand to Ken is an invocation of a set of rules for them as well – he's only a sample – and they respond to that.

Of course it's of interest to see the extent to which various activities will, in this fashion, turn out to be in orderly collections, i.e., if you do an X to some A then you're doing a Y to some B. It would also be nice to see which ones remain equivalent, i.e., if you do an X to A, you're doing an X to B in the same conversation.

So, whereas I was perfectly well talking about the fact that persons who are not the speaker or the directed hearer are not overhearers, there was no systematic incorporation of the other parties. Now, we had grounds for saying why they should be listeners. One of the questions I was interested in was to try to work out: Why should it be the case that the person who is not addressed in some utterance in a multi-party conversation should listen to it? It turned on matters like, very simply, suppose there's A, B, and C. An utterance comes off, it's addressed to B by A. Now C can tell right off that it's addressed to B – say the utterance begins with B's name. Why should C listen to that utterance? The reason is that even though the next utterance will be by B, and if C is going to talk after that he can always listen to that one, C should listen to *each* utterance no matter to whom it's directed, because, for one, B's utterance is expectably tied to A's in such a way that to understand it – say, answer a question that B makes – you would have had to listen to the utterance directed to B.

So I had provided a place, then, for C. But there was no indication that a question to B was something also to C, and that C would be engaged in considering what that was. And that, furthermore, A would be engaged in considering what that was. And, furthermore, A could, e.g., choose to address a remark to whomever he pleased, without regard to that being the person to whom he was addressing some action. He might well want to direct an action to C, and direct his utterance to B. There are ways of doing that sort of thing – whatever that sort of thing may be.

The kind of incorporation, then, of the tasks of this C, who has had no utterance directed to him, is something far more elaborate. And it requires a whole new order of analysis, in which is considered what A is doing to these various parties, and what they figure he is doing to them – although they have not been addressed, in the case of somebody being addressed – or what they each figure if none of them had been addressed specifically.

And we can make obvious chains, e.g., if A challenges B, then C can see it also as a threat to him. Or showing off. And you can see, then, an issue which immediately comes up when you begin to consider this sort of thing, which is what I've been thinking of as the 'effectivability' of actions in various formulations of parties present. And here is the data which leads to that area of phenomenon. Right at the beginning of the first session they're talking along, and Al says to Ken:

Al :   I'll give you 'til three to move.

.

.

Al :   One,
Ken :   hehh
Al :   Two,
Ken :   heh heheh Alright . . .

An obvious challenge. And when I was reconsidering that piece of data by reference to the therapist's intervention into the making of arrangements, i.e., "Ken, why don't you make these arrangements out of here," I was wondering why didn't the therapist say, "Al, why don't you do that kind of stuff out of here," i.e., don't make any challenges here. Or why didn't he involve himself somehow in that challenge? And there could be some perfectly obvious reasons, where, say, it sounds like a challenge, and in some environments it could be effectively a challenge, there is no reason to suppose that here it could be effectively a challenge, i.e., that one outcome of a challenge – a fight, say – could come out of it. And that furthermore, Al and Ken perfectly well know that, and would somehow arrange things to go as they would perhaps be gone through in a challenge sequence of talk, but would not have one of the outcomes of a challenge. They wouldn't bring it to that because they were perfectly well aware that if they did that he would have to intervene. And of course one of the persistent things that they're doing all along is having him not intervene.

In that regard, then, the conditions under which some action can be effective, are something independent from the fact that a form of that is produced. And that the whole sequence of talk involved in one of those forms is gone through, is independent of its possible effectiveness.

One needs of course to get at those issues of effectiveness. And obviously one of the things about possible effectiveness turns on the possible identifications that are invocable in a scene. So, for example, in the case of a challenge between Al and Ken, we could know that it would not come to a fight by virtue of the fact that a fight would invoke patient–therapist as a relevant set of identifications, and that ought to bring it to a stop. But also, of course, there's a point to playing at challenges, since what they want to see is what they can do short of that authority being invoked.

And in that regard of course you could consider a perfectly obvious case, i.e., seductive behavior in a multi-party conversation. Is he or she trying to make he or she, or are they doing it for somebody else? Obviously one would deal with the situation of A teasing B sexually in a scene of three or four persons, differently than in a two-party scene. So generically there is that issue of 'effectivability' with respect, say, to two-party activities, and then the linkages of two-party activities have got to be fitted to the handling of multi-party conversations. Where the handling of multi-party conversations gives you a start at that by virtue of requiring you in the first place, in considering whether you've done an analysis, to consider not merely the fact that you've located and given an explication of that A has done such a thing to B and the way one does it is such a way, but also, what is it that C and D would make of what's been done to them, and how that could have been involved in A doing what he did to B. For example, a 'challenge' is 'showing off.' And such considerations, of course, could give you something that one would very much like to have – the higher level relationships between the various activities.

What we've now gotten is, in the first place while the non-directed hearer was not an overhearer, there were ways in which he might as well have been an overhearer. But now I'm proposing that he's nothing like an overhearer and can be perfectly well the direct subject of some utterance, even though that utterance is not directed to him.

It may well be that this will be helpful on stuff like utterances directed to B, which C then inserts a remark about before B does. C could be 'violating' some sequencing rules, but it may well turn out that there's some way in which C figured that he had some business answering.

So one gets, then, a set of intrinsically two-party activities which, when done in multi-party situations, can be different sorts of things. And if that's the case, we have another way of tackling this issue of whether a dictionary treatment of the words that are used in conversation could possibly, could conceivably work as a way of handling it. Where what we get to see is that some word used in some utterance in a perfectly standardized way in a two-party conversation (leaving aside the issue of it being used, e.g., in a text), need not be at all the same sort of thing in the 'same' utterance ('same' in the

sense in which people talk about 'same token', 'same type') in a three-party conversation in which, that utterance having been done, it invokes one or another set of identifications, depending on which ones happen to be there to be invoked.

It is now unveiled, revealed, made transparent. Because one should now come back to look at the data, to begin to examine that thing. It's all over the place, and it's perfectly obvious that such a thing has got to be investigated – and that furthermore it is investigatable, since third parties are, among whatever other ways they have of telling us what they figure had been done to them, constantly announcing what they make of what something did to them which wasn't directed to them.

So, for example, there's a thing that can be done in conversation; talking to each other through another. In a conversation I've been working with, from Barker and Wright's *One Boy's Day*, the parents are interrogating the kid about this big crate he found. It seems to me that they are talking to each other through him. Now I recently came across a case of it where it's announced. It's a supreme court case that was reported in the newspaper. Now, during the hearings, the judges do not talk to each other. Their form of talk is, they address questions and hypothetical arguments to the lawyer who is arguing the case at the moment. At one point in some case one of the judges apologizes to the lawyer for using him as a way to talk to another judge, and says that that's what he was, in fact, doing. This is the kind of data we need – that persons not only do that kind of thing, but do it knowingly, in that sense of seeing it as a thing that they can accomplish – in this case, under the constraint that they couldn't in fact talk directly to each other.

Now we can begin to see that the multi-party conversations will require further analyses, beyond the interpretations of how some technique for doing a challenge is a technique for doing a challenge. How it also is a technique for showing off to somebody who is not the challenged person, etc., will be equally well the problem. But it also will give us a way of beginning to form up the kinds of thing that any given way of doing something can be doing it. And then, obviously, the relationships between the various categories of activities. And the ways in which those things can, say, invoke various complications.

It's seeing that sort of stuff, seeing these sorts of requirements, and seeing some data which first generates them, and then when you look back to it seeing that it's all over the place, that I then understand, Alright now, attention has to be payed directly, independently, to multi-party conversations, and there's ways in which they could be much more interesting. Two-party conversation is much blander, perhaps, at least with respect to these other issues, than is multi-party conversation, though clearly enough one needs the two-party conversation because a lot of the things that get done in the first place are two-party phenomena.

It struck me as I thought about it, Well why in all this time did it never occur to me? Why did I always proceed by, if some utterance is directed to somebody, then trying to see what it was? Now, having great faith in the

machinery that gets built into our heads, the fact that I proceeded that way seems to me to suggest the following kind of thing: The line I'm taking now can create, theoretically, tremendously involved problems having to do with, say there are three persons who are not talking in a four-party conversation. A says something, and suppose it's obvious that he says it to B. How do C and D go about deciding what in the hell has taken place? Does D, for example, first try to decide what has been done to him and then choose ways of seeing what has been done to C and B, etc.?

Given the fact of the way I'd been handling this stuff, which seemed to be in the first place so compelling, it occurs to me that it may well be that the first methodological rule for C and D is, if an utterance is directed to B and is doing some activity, find out what that is, and use that to find out what's being done to you. That is, all parties who are rules users will analyze in the same sequence. The first thing they'll do is see who it is directed to and what it's doing to him, and then use what that thing could be doing to anybody else, by virtue of it doing, say, a 'challenge' to B, to find out what it's doing to them, or anybody else. That would then suggest that the sequence of interpretation could be orderable, and that a sequence of possible things the utterance could be doing, could be orderable. So that to find that it's a 'threat' to you, you have to have seen that it was a 'challenge' to him.

Furthermore, the speaker may pick out the person he's directing some utterance to, to do some action with, by reference to such considerations as the orderly analysis of action possibilities, turning on such an issue as, e.g., if he addressed somebody else with the same utterance it wouldn't be a 'challenge,' but, say, a 'mockery.' That is, if Al challenged Louise to a fight, that might well look like a challenge but not be a challenge at all, obviously, but a joke. Then it wouldn't be a threat to the others. So, for the very same form there would be an issue as to, not only what it was initially, but what it could end up to be – turning on what it was initially. Where that would involve everybody agreeing to treat what it was initially as the first thing they should find out, i.e., what it was to the person to whom it was directed.

That seems like a very nice possibility as a way of proceeding, and, for one, it would provide that the use of directedness has some systematic importance. And perhaps, then, it would also set up controls on what could be made of an utterance done in conversations of various numbers of personnel and various possible formulations of that personnel. Picking who you were addressing an utterance to could be formulated as quite a crucial activity, for the purposes of the chain of interpretations.

March 9

Topic; Utterance placement; 'Activity occupied' phenomena; Formulations; Euphemisms

I'll start off with a consideration of 'topic;' some technical features of *topical organization* of conversation, the general issue that's involved in it, and, using this as something of an example, consider how it is that one may notice a phenomenon as something which can be possibly cut into. There are some very obvious things about topical organization of conversation. It does appear that persons orient to the fact of topical organization, and that they have a variety of ways of doing respect for topical organization.

Naively, one could ask a question like this: People come to conversations, and they regularly enough have a bunch of things to say. Indeed, there are conversations which persons come to with a de facto list, e.g., kids on first dates. There is the issue of being prepared to talk about things, having 'something to say.' Now, why don't they just say it in a bunch at the first chance they get to talk, or intersperse these things every time they get a chance to talk? And furthermore, as talk goes on, things occur to them; why don't they just stick them in? They don't do this. Or take, for example, calling somebody up with a specific item you want to tell them. You probably won't start off the conversation with that; you'll allow it to be something that comes up in the course of the conversation. And there are things which 'come up in the course of the conversation' which you can figure the person was perfectly well going to tell you. (Not even raising the classical issue of when does a person coming to ask for a favor raise the fact that they're coming to ask a favor, and how one would set thngs up so as to get that to occur.)

And then, there is an enormous amount of saying-things-to-something-that-somebody-else-has-raised. Consider the following, from GTS 2. As part of a joking interchange Al is addressing Ken:

Al :	Then you– then you'd have t'start shaving.
	(/)
Ken :	hehh
Roger :	Hey I shaved this morning– I mean last night for // you.
Al :	Yah I- I'm glad– I noticed that today Roger,
Ken :	Ye(hh)s I did too.
	(/ / / /)
Roger :	That's 'cause you made that vicious remark.

Now Roger went out of his way to shave, because he was insulted the week before – at least that's what he says. He comes in, doesn't say anything about it, nobody else says anything about it. He brings in his item at a place which has been provided by something else.

In another session, Al has a car that he bought from Roger. He's had the car a short time, the car malfunctions – and malfunctions by virtue of a possible defect that it had all along, that Roger didn't tell him about. He comes into the session and doesn't say a thing about it. It is an enormous issue for him that here his buddy sold him a bum car. He doesn't say a thing about it. At about one hour and 15 minutes into the two-hour session, the following occurs:

> *Ken*:   Now Al. Al likes t'likes t– Al likes to uh t– to ride sailboats or–or something–
> *Roger*:   Not any more hah hehh ah hah heh
> *Ken*:   Why? What happened?
> *Roger*:   She's gone hehhhh
> *Al*:   She is sold. She's gonna be sold.
> *Ken*:   Oh. Well, he used to.
> *(Al)*:   Mm hm,
> *Ken*:   Or he–he still does in–in the back of his mind probly.
> *Roger*:   Now he likes to drive fast Austin Healeys now.
> *Al*:   Not any more.
> *Roger*:   What happened?
> *Al*:   It blew up.
> *Roger*:   <u>Didju</u> <u>really</u>?

And the thing is pulled out of him. But he doesn't bring it up.

Now I don't think that I would use as part of my argument such a thing as 'they have something to say and hold it in abeyance so as to stick it in when they get a chance, as second items.' But I'll make a principled statement, which is quixotic enough, but I believe in it: I don't think it's any worse for sociology to anthropomorphize than, say, for physics to do it. No better, but no worse. All research anthropomorphizes its objects, and I don't see where it's wrong to anthropomorphize humans. This is not to say that I believe that they're anthropomorphic. I certainly don't. But I don't think you get into any special trouble, as a way of focussing things. And what I'm trying to do here is make my transcript noticeable to me; to get at such things as, say, now being able to see stuff being placed second.

Just consider stuff like the following; a telephone conversation between two elderly women:

> *A*:   Say did you see anything in the paper last night or hear anything on the local radio, Beth Michaelson and I drove down to Ventura yesterday,
> *B*:   Mm hm,
> *A*:   And on the way home we saw the most goshawful wreck.

B: Ohhhh

.

.

A: . . .I was going to listen to the local r–news and haven't done it.
B: No, I haven't had my radio on, either.
A: Well I had my television on, but I was listening to [the blast off, the astronauts] . . . and I–I didn't ever get any <u>local</u> news.
B: Uh huh,
A: And I wondered.
B: Uh huh, no, I haven't had it on, and I don't uh get the paper, and uhm
A: It wasn't in the paper last night, I looked.
B: Uh huh. Probably didn't make it.

.

.

A: Boy, it was a bad one, though,
B: Well that's too bad.
A: Kinda // (   )
B: You know, I looked and looked in the paper– I think I told you f–for the uh f–fall over at the Bowl that night. And I never saw a thing about it, and I looked in the next couple of evenings. Never saw a th– a mention of it.
A: I didn't see that either.
B: Uh uh. Maybe they kept it out.
A: Mm hm, I expect.
B: Uh huh, deliberately.

Now, drop the question of whether the first one came into the conversation with her 'bit' in mind, and the second one didn't, or did. The issue is that you get that kind of fitting together of things, if, when A raises an item, B has 'another' one on that point. And it is done immediately, right into the place for it.

In certain kinds of two-party conversations, that kind of 'you got one, I got one' for any item anybody raises, is legion. But the thing to see is that it happens just that way, and not, say, coming 18 lines further into the conversation: 'By the way, you were one ahead of me on things that you had, and I didn't have one, and now I happen to remember that I in fact saw an accident.'

So we're not just saying that someone has something to say and then 'waits' for an opportunity to say it, but that when somebody says something, then he says this thing. One wants to get a sense for the fact that items are placed where they belong in conversations, by virtue of things that occurred immediately prior. Regularly, things are placed nicely. And you can begin to see that persons seem to be definitely orienting to putting something in as a second utterance. And in thinking about it, I perhaps exaggerate, but I put it this way: They would much rather say something second to a raised topic than bring up a topic. This fellow Ken does a slightly perverse version of this

sort of thing, which is, when he has something to say he frequently starts a topic by inviting somebody else to talk to it. Then after they talk to it, he says the thing he had to say all along.

Now, the references to 'waiting,' etc., were to focus on this matter of placing an utterance, as doing an activity which can solve the possible questions which can be raised about items that somebody might produce anywhere: 'Why did you say that?,' 'Why did you say that *now?*.' It being the case that, on the one hand a particular topic is being talked to, and, for the run of things there is a topic at hand, it would then perhaps be the case that insofar as you are respectful of topics, i.e., talk to raised topics, then to some very considerable extent, that persons come to see your remarks as fitting into the topic at hand, provides for them the answer for how come you said it now. That is, it solves the possible question automatically. Upon hearing the statement a hearer will come to see directly how you came to say that. And given that you've placed it topically, positioned it appropriately, the specifics of the thing, in the sense of why you did *that* thing, may be quite irrelevant. That is, surely you could have said various things now, about that topic, and you said this one of that set. That may be a special issue.

But the clarity with which, orienting to 'topic,' they can then see how that now came to be said, is one tremendous gain for all concerned. That is, it's not only that you can slip something in where people will not complain, but that they have the gain of the fact that you preserved for them the existence of a 'now,' oriented to the present topic.

One would then want to begin to get ways that persons go about, e.g., showing respect to topics, avoiding a topic if they can, etc., so as to begin to determine, e.g., that indeed they do go out of their way to show their respect for a given topic as a case of 'topics.' For example, in the first GT session, the participants have formulated a long stretch of talk as an ongoing attempt to get Al to say 'what's troubling him.' And he's engaged in an attempt to not give that. There's a variety of ways in which he doesn't do it, and they talk to the fact of what he's doing, e.g., that he is silent, or that he takes opportunities to do things other than talk to the topic. But the things that he does are regularly not un-oriented to the fact of a topic existing. So, there is a sequence that goes like this:

> *Ther*:   'Cept that it is part of the function of the group to begin to share uh <u>in</u> some of these things, so that the others can understand themselves, // (   )
>
> *Roger*:   Well that's why we're pumpin' // him.
>
> *Ther*:   Right. Right. No, I was (   ) answering Ken.
>
> *Al*:   I have to adapt myself to the idea that I want – –
>
> *Roger*:   You don't feel secure with us.
>
> *Ther*:   Butchu don't // wanna–
>
> *Al*:   That's right.
>
> *Ther*:   As I said // earlier you don't want to adapt // yourself out of existence, Al,

Roger :   I'm gonna blackmail you.
Al :   Fuck you.
Ken :   hhh
Roger :   Better not I become pregnant easy heh // hehh heh hhhhh
Louise :   heh heh hehhh
Louise :   Take birth control pills.
Roger :   hehh heh
Al :   Hey I saw // saw a real neat // joke
Ken :   The little green pills?
(   ) :   ((COUGH))
Al :   I went down to the Ports O'Call Village, not to be changing the
             subject but she brought it up–
Roger :   Not to be change– "I wouldn't change the <u>subject</u>,"
Al :   But there was a birth con– they had a joke shop with a birth
             control pill and it was made out of styrofoam. Put it between
             your lee– legs'n press very hard.
Louise :   hehh hhh
Al :   heh heh heh

Where what Al is then doing is treating the sequence as a respect for topic by picking up the matter that's been proposed. He does this partially as a joke, but now as a conceivable report of, now we're talking about birth control pills, here's something about that. Which would be perfectly okay if it were indeed the case that birth control pills was the topic.

What's interesting is that he talks to the fact that he's 'not changing the topic.' Is it just that such is the case, or is it that his talking to the point is some recognition on his part that indeed he could not properly treat this string of one-liners taking off from his initial "Fuck you" as providing a new topic – where, whatever it is that they are about, it is not the provision of a new topic.

That excerpt then becomes accessible to technical considerations with respect to an orientation to preservation of topic, e.g., the kinds of items these one-liners are, the possibility that the topic is in fact shifting, that things can be treated as shifts, that locuses of shifts can be identified – for example, approximately 11 minutes following the above sequence, we get:

Louise :   Hey wait a minute we were talking about <u>his</u> problem . . . . And
           you got us off it beautifully. With that lousy little joke about the
           uhm birth control pill. We were trying to get him to tell us what
           was wrong.
Roger :   You <u>sneak.</u> hehhhh

And if things can be treated as shifts, there is the issue that an item can now be introduced as second to a given topic that's been raised, by references to the utterance that did it.

If that's so, it provides an interesting machinery for getting topics changed, i.e., one could get into one of these insult exchanges, where, whatever the content of one of those insults is, that can be treated as a proposed new subject. If so, persons would have to be, perhaps, much more careful about the content of their insult returns, objections, etc. We would have to check out whether such things are in fact done, so that we could see whether Al's proposal "not to be changing the subject" is put in by virtue of its being more or less analytically obvious to them and to him that indeed he's made a move which he could perhaps justify, but it's not legitimate, conventional, preferred, etc., and indeed 'exploits' a possibility.

The underlying large issue which one would be interested in having attended in a consideration of orientation to topical organization of conversation is this: Assuming that you've got your hands on some order of fact, you want to try to find what sort of order of facts it is, i.e., where does it fit, what is it derivative of, what's consequential on it. Can you say, e.g., topical organization of conversation is a consequence of X phenomenon, and X phenomenon is more primary then topical organization, and topical organization has as its direct consequence Y, and Y has as its direct consequence Z? This is a general issue, having to do with the arrangement of a theory. If, for example, you take things like 'one party talks at a time,' 'no general sequencing formula for multi-party conversations,' 'orientation to completion,' etc., and try to arrange them and see what kind of order there is between them, you may find, e.g., 'one party talks at a time' seems to be a primary rule for conversation, where an 'orientation to completion' is one of a series of rules combined with it that give you machinery for the various other phenomena.

For the question 'Why should conversation be heavily topically oriented; is there some systematic basis for that to exist?' an answer to it is perhaps to be found by considering, as the locus of the solution, whether it's not the case that topical organization is a direct consequence, almost an artifact, of the tying structures. If you're going to have tying structures as a fundamental organizing principle of conversation, then you're going to have topics as a consequence.

Tying structures are fundamental to topics as organizers of conversation by virtue of the fact that the tying structures are a general, and also completely local means for checking out and enforcing the work of showing that one is understanding somebody and requiring them to understand you. Tying structures work by tying utterance to utterance, i.e., pairs of utterances. In fact, if you begin to ask directly about the local operation of tying rules, you could easily find difficulties occurring merely by virtue of a skip of an utterance, turning on, e.g., the speed at which persons insert remarks. A says something, B says something, C says something intendedly tied to A's utterance. It may be altogether unclear whether C's remark is tied to B's or to A's. And if while in principle tying is local in that strong sense, there are some apparently systematically characterizable extensions on it, e.g., a given speaker can tie utterances of his own together across utterances of other

persons. A talks, B talks, C talks, then A talks with clearly a tied utterance, tied not to B's or C's, but to his own. And, e.g., things like those single-line jokes can be 'ignored' for tying, so that if people are talking along, someone sticks in a joke, there is an obviously tied next utterance. To find what it's tied to, the joke is perhaps not something you have to consider. However, basically tying is a two-utterance phenomenon, in which the basic components are the pro-terms. If the pro-terms are going to be used to do tying, and used extendably, combinably, etc., then the things like nouns and verbs get special use. And insofar as they more or less totally populate an utterance, then that utterance tends not to be a directly tied utterance. Now, the nouns and verbs are the topic carriers. It is then, in a sense, directly a consequence of having tying that you're going to get those nouns and verbs becoming what we take to be 'topics,' i.e., in an extension in which they remain 'the subject' over much more extended grammatical or non-grammatical units.

Considerations such as these would permit us to treat the machinery for orienting to 'preserving a topic' as something fitting onto the tying structures, as an accessory to those. And then we would be in a position to find that there might be a systematic relationship between those sorts of phenomena.

Now, one needs every resource one can muster to, in the first place, crack into what can then be an observable organization of phenomena, i.e., to make the data accessible. One such resource is to find some way of seeing how this thing is noticeable by a confrontation with, say, the fact that as a common-sensical reasoner someone's life matters, or their good name matters, etc. Then one can notice the things that people will do which are inconsistent with that, and raise to the status of primaries, these inconsistent things. Once you crack into it, you don't need to do that. But some sense of how much these 'conflicting' things matter can be gotten at by virtue of the extent to which, say, a person under great stress will continue to live with them. For example, some techniques for getting confessions turn on an obvious fact: People will, when confronted with a possible inconsistency in their statements, act to preserve their claim to rational talk at the expense, say, of their lives. So, persons on trial for murder, when confronted with proposedly inconsistent remarks, will confess. Embarrassment of this sort is apparently a primary.

Such a fact can be brought to attention here. That is, we can begin to try to see to what extent is it the case that persons will respect the existence of topic, and talk to it, while doing what we commonsensically know are drastically self-derogatory things. We might come to see that they, in the course of a topic, will go out of what seems to be their way, their interests, their claims to decency, etc., in order to acknowledge their respect for a topic in which its current course involves them in saying such a thing. And, conversely, there are a list of topics which people may want to refuse to talk to at all. Where one can see right off that the issue is not anything and everything that has to do with that topic, but with, say, a very circumscribed set of statements that might expectably be made by virtue of that topic being up.

It is by virtue of this sort of thing that we can begin to get an idea that what we suppose to be of primary importance over something else, may not be.

Where you could only make these confrontations between, say, someone's life and embarrassability, someone's promise and a respect for topical organization, if you begin to get the idea that 'embarrassability' is something, or that 'respect for topical organization' is something – where you always have the idea that 'life' is something and 'a promise' is something. I am not here proposing that what you do is now raise something that everyone knows matters – say 'embarrassability' – to a status of 'it matters much more than you think it matters.' I am trying, rather, to break into a course of talk, and be able to see that, and how, it is organized.

That is to say, you can use our conventional ideas about what matters in order to see that some things that persons say by virtue, apparently, of something like topical organization, are not what we would expect if we supposed that, e.g., they want to preserve their good name, with that formulated in terms of their respect for values, etc., rather than in terms of respect for topical organization.

Once you crack into it, you can begin to focus on such things as the order of facts it is, and the various levels of features of it, so that it can be put into whatever place it has, as another thing involved in the analysis of any piece of talk, and which may or may not be overtly involved. So that you can say that the rules of topical organization are involved, say, as an accessory to the tying rules, that persons are attending it, that a consequence of topical organization may be that it provides for a 'now' at all points – in the sense that if an utterance is fitted topically, it solves for hearers the question of why was that said and why was that said *now*, and where the conversation is 'now;' giving you a characterization of 'now,' abstractly.

One can attend a bunch of talk and begin to pick out the machinery by which persons show their respect for a topic, by which they preserve an orientation to topic. For example, there's a whole range of meta-facts, i.e., direct topic-talk machinery, "You're off the subject" and things like that. One can see as obvious consequences of the order of facts that topical organization is part of, such things as, you can't get a topic done by yourself. You might be able to stick in a monologue, but it requires collaboration. One might also begin to look at stories and jokes to see that they work as things that permit extended tying, but they're quite different phenomena from topic talk – at least the participants to the conversation we're considering seem to figure that a sequence of telling jokes is 'not talking about anything,' i.e., is not topic talk.

It would be of interest to work out things like: What things does a conversation provide you with a place for them to go fittingly? And what are persons' orientation to the accommodations that a conversation may have vis-à-vis the things they have to say, or figure they might be 'forced' to say? (In that regard, the statement "We were in an automobile discussion," apart from being an 'invitation,' has as one possible interest that it's informative to the entrant as to how he should orient to the proceedings, i.e., that a respect for topic is something that they do. He can use such a notion and attend the conversation as topically organized, where he might have expected rounds of monologues, question–answer sequences, etc.) Most particularly, one can ask

how persons go about showing that they're preserving respect for an orientation to topical organization, by reference to *a* topic, while topics are fast changing.

Now, I have a further remark to the very first piece of data I used in this lecture. It is at this point parenthetical and not much more than anecdotal. The data is this:

Al :   I noticed that today Roger.
Ken :   Ye(hh)s I did too.

Where, semantically one could say 'You didn't do it *too*, you *did* it.' That is, 'too' serves to mark the fact that this is a second observation on that thing which was just noticed, announcing no more than 'I'm saying the same thing as he said, after him.'

This pair, 'I did,' 'I did too,' occurs with enormous frequency. And it may be that people, on hearing that 'too,' are somewhat suspicious of it, i.e., there's a general malaise hanging over that kind of use, and it doesn't quite come off. This may have to do with one of the alternatives for 'I did too' being an independent statement of sorts. For example, 'I noticed that,' and then someone else, 'I *knew* there was something different about you,' as a way of saying 'I did' second to someone else's having said 'I did.'

As soon as you play with 'I did' you realize that just 'I did' is impossible. It can be accented in two different ways: '*I* did,' or 'I *did*.' Each of those has perfectly clear meanings. The first is competitive and the second is insistent. So there's no place to do with 'I did' what you can do with 'I did too.' That is, 'I did,' having been done once, it cannot be repeated, and is in that sense, '*activity occupied*.'

This opens up a couple of directions one might go with this sort of thing. For one, intonation and accent patterns as systematically characterizable activities. And then the business of a phenomenon being 'activity occupied.'

And finally, the following is a kind of appendage to the lecture on February 16. Let me quote something from the data, GTS 1, page 61. There's a fracas of sorts, where apparently Al is picking on Ken. Then:

Louise :   You're pickin' on people you know are weaker than you.
Al :   How do you know // he's weaker than // (   )
Roger :   Now you're pickin' // on people you know are weaker 'n you.
Ken :   THANKS!
Louise :   I'm not— I'm only pickin' on Al,
Roger :   Well you're pickin' on HIM you // clod!
Louise :   Not Ken!
Roger :   Yeah sure! You told him he's pickin' on people weaker than you. So you said he's weaker'n you.

I have the idea that data like that may have a kind of special interest for us, in the sense that it may deal with something I've talked about. For

example, I've made the kind of rash statement, "There's no room in the world for interpretation." I've talked about things there's 'no place for,' 'you can't get away with doing,' things 'you can't do *only*,' etc. And I've been looking for that sort of data which an analysis of will exhibit clearly the kind of thing I mean to point to by those remarks.

My feeling is that things like 'You're *picking* on him,' '*You're* picking on *him*,' are the kinds of things that one wants to look at. Where an assertion by A may be restated by B as an assertion of the things that, now, A is doing. This may be generally stated as: Any case in which A proposes, say, a formulation of what B is doing (strictly, now, not doing anything but naming what B is doing), it's available that now A's proposing of a formulation can be treated as the doing of something other than that; indeed, perhaps, ideally, the very thing that A has formulated B as doing.

Now what we want to see is how such a thing is in principle possible, and the way it shows us that there's no room to 'just name' what B is doing as a thing that could now be seen as what you're doing. Where you might suppose that you could be 'merely putting a name on what he's doing;' that you could control what formulation could be done on what *you* did – say, it was a meta-conversational remark for somebody who doesn't know what's going on; such a thing as an anthropologist would treat as the kind of information he's dying to get. And that's what I was getting at in my previous examples, "What do you mean?." "What do you mean what do I mean?"

If it's the case that any doing of a naming is also formulatable as doing something else, where, say, the 'something else' includes, among other things, that sort of thing as was named, then one gets into a nice set of consequences. One of them is, you can't say 'At *least* they're doing naming' and try to save your results that way, because if you get, e.g., the combination Insult + Name, and that's the thing being done minimally, then you have no guarantee that this is 'an acceptable name' which can occur otherwise than with an insult, for the object that's being named.

I have talked about the phenomenon of 'intentional mis-identifications' of persons, i.e., where somebody says "Yes, Mommy" to somebody who isn't their Mommy, where it's seen to whom it's directed by virtue of its being a 'second insult.' It became obvious to me that I had to break down 'intentional mis-identifications' into, e.g., 'intentional mis-addresses' and 'intentional mis-references.' For example, in GTS 2, Roger says to Jim, "Daddy sorta sheltered you." It's not Roger's father who's being referred to, it's Jim's father, who is not a person Roger correctly refers to as 'Daddy,' but one who Jim proposedly addresses as 'Daddy.'

That he can intentionally mis-identify, reference-wise, that person, is one of the many cases where you can refer to X with a term that is not a term that applies to X, as one of the items on a list of names from which you would select to refer to X. So that you can't say definitively that with Insult + Name you at *least* have a normal, correct name for the person being referred to, where you can have an intentional use of names known to be incorrect, used referentially for somebody.

Even supposing you were returning to the issue of 'merely a name,' and not Insult + Name, the question could then be put: What does doing 'merely the name' involve, given the fact that the selection set for a name is not initially restricted to the correct set of names but first has to be extended to, e.g., the collection of things that anybody could be called nastily but that are not correct for anybody. Where the very fact, then, that a name is being used, puts one into the situation of trying to see what's being done.

Further, 'merely the name' may involve, as well, such techniques as naming euphemistically. For example, in GTS 1, page 8, Al has just gone through a threat to Ken. Then:

Ken: He's in a jolly good mood this morning,
Louise: Yeah
(/ / / /)
Ther: He was in a jolly good mood last week.
(/)
Louise: ⌈But that was–
Roger: ⌊I think we ought stone him for these uh appearances hehhh
Louise: No <u>he</u> wasn't in a jolly good mood last week, <u>we</u> were in the jolly good mood last week.

Where it is perfectly clear that 'jolly good mood' is being used euphemistically for 'lousy mood,' and then in Louise's utterance, Al might well have been in a good mood, *we* were in the lousy mood.

Euphemism is by no means a special thing. And one might suppose that one would first ask why would someone say something euphemistically rather than directly. But that is, as an approach to the problem, wrong. A first procedure ought to be: Given a fact like the tremendous use of the tying rules, etc., the mandate of talk involves talking in such a way that the fact that somebody else understands what you've said involves them in some kind of work. So it's much better to say something such that, then, that they understand what you've said, proves the relevance of your remark. The crucial thing is always the relevance of your remark.

And if it's obvious that Al's in a lousy mood, it's a nothing-to-say. The thing is to try to talk in such a way that a task of analysis is involved. The success of that analysis provides the lack of need of an account of why you came to say it – and that, of course, is relevant to the earlier discussion of topics.

Methodologically, were you to ask the question, 'Why is euphemism used here, why is mis-reference used here, when they perfectly well could say directly what they wanted to say?' you'll get into trouble. It may be that you could make a case for euphemism as an alternative to direct reference, where direct reference is seen as a norm. However, it seems to me that the things called 'indirect reference,' the pro-terms, etc., are the most usual ways to talk. Where, roughly, the fundamental issue for talkers is that of relevance. And the fundamental aim is to have proved, by the de facto understandability of

what they've said, that the other, by understanding what you've said, sees that he's not in a position to, need not, turn that utterance into a problem. That is to say, all that machinery for checking things out – why an utterance is said, why now, why did he do that, why did he refer that way, etc. – as much as it is possible, is built into the structures for doing talk. And if that talk is at all understandable, it solves those issues.

Part V
Spring 1967

Lecture 8
"Everyone has to Lie"

While I really should move on to other data, I'm going to stay in some sense with the same materials we've so far been using because I want to pound home – if I haven't already – the relative non-exhaustability of what one might be able to dig out and use from what on first glance is relatively uninteresting. What I'll do is present one of the 'exercises' I'll be presenting now and again. Let me first give some background. A few years ago I was working on an extended study in 'greetings.' Things like "Hi" "Hi," "Hello" "Hello," etc. In the course of it I acquired various more or less small points. Recently I've considered the matter of 'absences' and the way in which 'absences' could be found directly from 'greetings.'[1] The stuff I'll present now uses 'greetings' and uses results about 'greetings,' but involves a kind of indexing, i.e., keeping 'greetings' in mind when other things are being thought about (where one wants to get results that can employ other results, and lock in on the kinds of ways that things seem to be organized, rather than, 'Here's a piece, there's a piece, here's another piece').

I had a fascination with a problem like this (and it's a very conventional problem in that it's obviously been 'answered'): How could we as social scientists go about saying about something that a Member said, that it's true. Where what we're talking about is something that a Member says about the social world. What I was looking for was a place where I could do an exercise consisting of seeing what might be involved in being able to say about something a Member says, that it's true; what the warranting of such a statement as 'Members say such-and-such, and it's true' would consist of.

In some tape I had, I came across a statement that I'd heard before, which looked like it was intended as true: Somebody said, "everyone has to lie." The reason that I could take it that the statement was intended as true, is that it sounded like a 'complaint.' And 'complaints' seem to be things which

---

Lectures 1 through 7 are not included in this volume. They consist of a consideration of the 'one party speaks at a time' phenomenon, using an article by Ethel Albert, 'Rhetoric, logic and poetics in Burundi,' as its point of departure, and transcripts of a group therapy session for teenagers as its materials. A rather more developed consideration can be found in the next set of lectures, those of Fall 1967. An earlier discussion of 'one party speaks at a time' can be seen in the Winter 1967 set, the lecture of March 2. The earliest reference to the Albert article is in Spring 1966, lecture 32, pp. 481–2, this volume.

[1] See, e.g., Spring 1966, lecture 04.b, pp. 293–5, and Spring 1966, lecture 5, pp. 307–8.

intendedly assert that something is so (a matter I'll deal with at another time).

There are a lot of ways in which a thing like that can be interesting, in that one wants to see how it is that the world is so arranged that the statement is true. Where one of the virtues of its being possibly the case that somebody can say something that's true about the social world is that it gives us some idea about what's available to them. That is to say, it might well be that whatever we have to find as the arrangement of the world that provides for that statement to be true, we also have to come to see that such arrangments are available to Members, so that a person could have arrived at that as a statement. It's not that now a social scientist comes up with such a statement – which would be one sort of thing – but that a Member is able to make it. (It is in other ways a possibly fascinating utterance, such as, if it's so, then of course we could play with things like how it is that the world is so arranged that persons have to do evil even if they want to do good – if, that is, lies are bad things.)

At the time I began to work on this thing I didn't have a very good idea about what 'everyone' means (and eventually we'll get to a consideration of terms like 'everyone'). But a first way we might consider it – so as not to get hung up on a way to show that it's *not* true (which would be to show that *someone* doesn't have to lie) – is to consider that way as one of two different ways that terms like 'everyone' might get used.

So, this one way would be 'summatively.' That is, whatever singular individuals 'everyone' might encompass, it has to be true for each of them for it to be true about 'everyone.' For example, there are ways in which a term like 'we' could get used summatively, so that if I use 'we,' referring – understandably and not necessarily overtly – to me and somebody else, e.g., "We stayed home last night," you could figure you knew who that 'we' was. And if you then asked another person properly included in that 'we' and they say "No I went out," then you could return to me and say "But you said 'we' stayed home."

Alternatively there are things like the usual *categorial* terms – 'males,' 'females,' 'Democrats,' etc. – for which one can say "Democrats do X," and if some Democrats don't, it doesn't affect the intended correctness of the term. It's not that a Member would go about complaining about a statement made with the categorial, in terms of 'I can show you one of them who isn't that way,' and then everybody would figure that they'd have to remove the remark or apologize for it, etc. Instead, there's some other way that those terms are controlled.

Now, 'everyone' might seem in the first place to be a 'summative' term. But let's leave it open as a possibility that it's a 'categorial' term, and governed in the way those are. It might be, for example, that terms like 'everyone' and 'no one' stand in juxtaposition to one another. If you come home from a party, for example, and someone asks you who was there and you say "No one," then, that there were 12 people there doesn't matter for the correctness of 'no one.' 'No one' means 'under some formulation of who

should have been there, no one was there.' Likewise, it might be the case that when asked "Who was there?" somebody says "Everyone," then there are formulations of 'everyone' which provide for the fact that 'everyone was there' indeed, though millions of people weren't.

So it isn't in the first instance our intention to say that "everyone has to lie" has to involve anyone who could be called a someone. There may be other reasons why 'everyone' gets used, and I'll suggest one right now: One of those reasons may be that 'everyone' is perhaps that categorial usage which doesn't have as its members, specific reference to a restriction to some other categorial. For example, 'everyone' doesn't mean that all 'males' were there or all 'females' were there or all Jews were there or all Negroes were there or all whites were there, etc. But there's a categorial, e.g., 'everyone,' that says 'whoever should have been there was there,' and they are not restricted to one of those other categories. So you could use it if there's some collection known as a group which doesn't have a group name. You have an informal club which doesn't have a name; you have a luncheon, and 'everyone was there,' i.e., all club members.

The idea is not that I'm proposing that some usage is 'correct,' but that the terms seem to be so used. And what we want to do then is find out how they could be used, rather than insisting that 'everyone' must mean something which is in fact not in conformity with the way it's handled – though you could perhaps construct such an 'everyone.' So then we don't have to begin by trying to figure out what 'everyone' is, and then use what 'everyone' is to set up a test of the incorrectness of "everyone has to lie." We don't want to start with a required interpretation of, say, each of the terms in the utterance (i.e., it could be given a 'strict usage;' that usage which you could adopt and debate with someone – and lie in the same fashion). Rather than that, what we would want is to be able to look to the way those terms get used, to find how they could be being used here.

Now, some of the results on 'greetings' seemed to be relevant to "everyone has to lie." So I began with 'greetings' material. In the first place what I wanted to see was this: If, whatever 'everyone' is and whatever 'has to lie' is, I could see, as intended: 'Sometimes for something,' and find a 'something' which is done many times by anyone, and find that sometimes that something would have to be lied about. Then I could have established the correctness of "everyone has to lie."

So what I was doing, then, was looking for a something that happens frequently for 'everyone,' assuming a lay sense of 'everyone' without specifying it. And 'greetings' turn out to be interesting in that regard. Because one thing we can say about 'greetings' is that they're *ahistorically relevant*. What I mean by that is, as compared to, say, 'introductions' which, having been gone through once (or perhaps erroneously three times, five times, whatever else) are no longer appropriate, between any two people without regard to how long they've been acquainted, there isn't any rule which says: On the n + conversation, no longer begin conversations with 'greetings.' Instead, any conversation they ever have – they could be married 40 years –

can begin with some greetings. And it's not only that when they've been married 40 years they can begin their conversation with 'greetings,' but it's also the case that their first conversation could begin with 'greetings.' To say that 'greetings' are ahistorically relevant is not to say that every conversation must begin with greetings, but that there's no exclusion rule for greetings. That's one sort of fact about greetings.

Also I've smuggled in another fact, and that is that if they do occur, then they properly occur at the beginning of a conversation. Now that sort of fact turns out to be important. And the way we get at its importance will be to suppose that there's a class of what I'll call 'proper conversationalists,' and construct subclasses of that class.

We'll talk about, first, a largest subclass of the class 'proper conversationalists.' We'll say about the largest subclass that what's definitive of it is that its co-members may engage in something we'll call a 'minimal proper conversation' – perhaps no more, but they may engage in a minimal proper conversation (if there is such a thing). Then, various smaller subclasses will be persons who can properly engage in more extended conversation than minimal proper conversation.

Let me just point out one nicety that we're going to try to find. What we want to see is that a minimal proper conversation is not something that can only be done by the largest class, but can be done by all other classes as well. There's good reason for that to be required, since it's not that we're merely trying to arrange things, but we're trying to find out how they're arranged. Suppose it were legitimate for the largest class to do this minimal conversation, but it were specifically illegitimate for some smaller class to do such minimal talk. Then it wouldn't be a 'minimal proper conversation' for 'proper conversationalists' and we wouldn't find that all the subclasses were indeed subclasses of that class. We would have a problem.

The question is, then, is there a 'minimal proper conversation'? If we can say that a minimal proper conversation is an exchange of greetings, then we have both that the largest class of proper conversationalists can do that – they may be able to do no more – and that the smaller classes, the people who can engage in more than that, can begin with that – since the exchange of greetings is ahistorically relevant.

Then, the question for the smaller classes is whether they can do *only* that on some occasion. And it does appear that even though people have been married 40 years, they can not only begin conversations with greetings, but there are occasions on which they can do no more than that, and do it without being violative for each other. That is to say, suppose a couple married 40 years pass each other on the dance floor. They can say "Hi." And one of them won't feel that something bad has been done to him by the other merely saying "Hi" and passing on, after a "Hi" has been returned.

One consequence of that is: The sheer fact that persons exchange greetings is not informative of their intimacy. Any two persons, no matter how intimate they are – or how un-intimate they are, if they are at least intimate enough to exchange greetings – can at some time only exchange greetings. So that you

wouldn't say, for example, if two persons merely happened in passing to say "Hi," that they couldn't be very intimate.

Now there is a class of *non*-proper conversationalists. And while they can come up and talk to you, they do it in a special way. That is, they announce that they know they're not proper coversationalists but they're beginning anyway, and for good reason. The kind of thing they use is a '*ticket.*' That is, they announce in their first utterance how come they started to talk to you even though they shouldn't: "Excuse me, I'm lost," etc.

But there are some people for whom the class 'non-proper conversationalists' is extremely restricted. That is to say, for some people there are few, if any, others who are not 'proper conversationalists' for them – at least among the largest class. And these are people like congressmen. Anybody can walk up to a congressman and say "Hi" and they'll get "Hi" in return. They'll in fact shake hands with you. Whereas a lot of people if you walk up and say "Hello," they'll look at you hesitantly and not say "Hello" at all. The consequence of that being so for congressmen, though not everybody perhaps know it is so, is something like this – and here I'm reporting a thing that's quite common in a small way, reported in the *New York Times*.

There was a fellow who was an 'influence peddler,' name of Julius Klein. And he was up for consideration once, turning on some investigation of Thomas Dodd. And now they're talking about the way Klein operated. He often had as clients people who didn't know very much about the government, whom he would tell about his relationships with all sorts of people in government. And what he would do is this: He would be standing there talking to this client, outside, say, the Congress, and a congressman would walk by. And he would charge over and grab the guy by the hand and say "Hello" and the guy would, with perfect friendliness say "Hello," maybe put his arm around him, and then split. Now Klein, by this technique, was informing his clients that this fellow and he were of some great intimacy. Klein knew that even though the congressman didn't know him at all, he would exchange greetings.

In that regard, then, the use of the non-ability to assume, from the fact that persons do engage in greetings, what intimacy they have, constitutes a sort of resource. A resource that is special in this case to those persons who will 'greet anybody' though of course most people don't assume that there are persons or some particular person who will greet anybody, because they take it that, since the class of proper conversationalists is bounded for them and most people they know, then the class is bounded for everybody. So the construction we're making can give us an expectation like the above, i.e., how Klein could go about being a phoney like that. Systematically. It's not such a big thing, but a nice bit of spin-off.

So: There's a largest class of conversationalists. They can engage in a minimal proper conversation, and perhaps no more. And there are smaller classes. But one of the things about the smaller classes is that while they can perfectly well engage in more, they can also on some occasions engage in no more than a minimal proper conversation. And an exchange of greetings is a

minimal proper conversation. That is to say, on some occasion, any pair no matter how familiar they are, can do only an exchange of greetings without arousing from one or the other, "What's going on?"

In this regard let me point out, again as a passing matter, that the fact that there's no exclusion rule for the use of greetings has as its consequence something people are well aware of: There isn't any good way to decide when an exchange of greetings should not be done in the course of recurrent units which would seem to make it mildly absurd. That is, in the course of a day you pass somebody seven times. The first time, okay. The second time, okay. Now when do you stop saying "Hello" to them, without them then feeling that there's something the matter? And apparently there isn't any good way to decide that, concertedly. Again, it's one of the kinds of things we're pointing to with the observation that there is no exclusion rule for these greetings.

Now, if things like "Hi," "Hello," etc. are 'greetings,' then there's a thing which we would call a *'greeting substitute.'* "How are you" is a 'greeting substitute.' in that it *may* be used as a 'greeting.'

One might say since "How are you" can go where 'greetings' go, why call it a 'greeting substitute'? Why not call it a 'greeting'? The reason for differentiating "How are you" from greetings is that one property of greetings seems to be – and this property will then exclude "How are you" from that class – that given some sequence, 'greetings' are not repeatably used. That is, 'greetings' cannot be combined with 'greetings' sequentially. I will demonstrate the sort of combining I intend they cannot do, by showing a special case where it might be done: In a telephone conversation, the one who answers says "Hello." That's to whomsoever may call. If it then turns out that it's somebody whom you would like to further acknowledge, you can then do another:

A: Hello?
B: Hello.
A: Hi!
B: Hi!

But for conversation in general, you do not get this sequential combining of 'greetings' with 'greetings.' But it is the case that if you have *a* 'greeting sequence:' "Hi, Hi," "Hello, Hello," "Hi, Hello," "Hello, Hi," whatever it may be, you can in addition to that have "How are you," then its answer plus a return of "How are you":

A: Hi,
B: Hi.
A: How are you?
B: Fine. How are you?

So then, "How are you" is excluded from the set of 'greetings' by virtue of the fact that membership in the set of 'greetings' does not provide for

combinations of those members as a 'repeated' use in a sequence. But "How are you" can be used after a 'greeting pair.' This might indicate that it isn't a 'greeting' at all, except that you can get things like "How are you" as a proper beginning of a conversation which would not then be said to lack a 'greeting.' It is by virtue of this distinction that I talk about it as a 'greeting substitute.'

Then, whatever we've said about 'greetings,' i.e., their distribution, their use as minimal proper conversation, hold for "How are you" as a substitute greeting. We're going to look, now, at "How are you" because it's with "How are you" that we begin to move in on "everyone has to lie."

But I need some more classes. I'm going to define two classes. One of them I'll call 'personal states' (PS). It consists of things like mood, appetite, sleep, etc. The other is called 'value states' (VS), and it consists of a bunch of terms like good, lousy, rotten, great, wonderful, etc. We'll talk of personal states as 'describables' and value states as 'descriptors.' Any one of the VS can describe some PS. "How's your appetite?" "Great" or "Rotten."

The value states are organized into three subsets; minus, zero, and plus. Here are prototypical terms: For [−] it's "Lousy," for [0] it's "Okay," for [+] it's "Great." That organization is mutually exclusive. If a term belongs to one it doesn't properly belong to the other. And you can pick an answer to a question like "How have you been sleeping?" from the descriptors.

There are some rather interesting kinds of things that obtain for these descriptors and that are strong support for talking about them being organized into subsets. Whereas you might suppose that if you are a recipient of one of them given that you've asked a question of somebody, then handling those descriptors requires some familiarity with the one whom you're dealing with − and indeed that it's almost strange that they would be used with respect to people who don't have adequate bases for 'understanding' them. If somebody says "How are you feeling?" and you answer "Normal," the question is what does somebody have to know in order to deal with "Normal," "Fine," etc. For example, that they would have to know how you go about measuring your daily variations. But it's a most remarkable fact that it just isn't so.

Now "How are you" also has its answers among the descriptors. So if you come up to somebody and ask them "How are you?" they pick a term from the descriptors. And the way that the subsets work, relevantly to our consideration, is this: If you pick a term from [0] or [+]; for example "How are you?" "Okay," then that's the end of that. In the case of it being you who was asked first, you might say "Okay, how are *you*." Or if you were asked second, then you would just say "Okay" and the conversation goes on. (There's some slight variation; if you say "Wonderful," they're liable to say "That's great").

If you pick a term from [−], then there's a procedure that would properly apply, which involves eliciting what the matter is. And the way you do that is to use various of the PS phenomena as question items: "How are you feeling." "Lousy." "Haven't been sleeping?" etc. That procedure, then, is

applied for [–]. And it's applicable without respect to what the parties know about each other, so that you can find that, e.g., you're going through the supermarket exit and a guy says "How are you this morning?" and you say "Rotten," he'll say something using the PS terms. The product of such a procedure is the eliciting of an explanation for the negative state. And it apparently is sufficient condition for engaging in such a procedure that a term which belongs to the negative state has been inserted as an answer to "How are you."

Now let's formulate a notion of 'lying' in this context. We'll talk about two steps in giving an answer to the question "How are you." First is selecting a subset. Second is selecting a term, which you announce. We'll call selecting a subset 'monitoring' your state. Now, since what seems to be involved is that it's the subsets that count, and the terms picked are picked as members of the subsets, and the subsets furthermore are mutually exclusive, then you can say that somebody is lying if, having done the 'monitoring' operation, they pick a term that the product of the monitoring operation excludes. The monitoring operation comes up with [+]. It then excludes all terms belonging to [0] and [–]. If you announce a term belonging to [0] or [–] you're lying. The same holds across the board. If the monitoring operation comes up with [–] and you pick a term belonging to [0] or [+], you're lying.

It may seem artificial to talk about a 'monitoring operation' except that it seems that the subsets count, so that it wouldn't be obviously wrong to say that a person first selects a subset, as compared to, e.g., merely just picking a term. And consider, for example, that people don't go about saying "You're lying. It's not true that you're feeling 'rotten,' you're feeling 'lousy'," or "It's not true that you're feeling 'great,' you're feeling 'wonderful'." But they might well say "You're not feeling 'great,' you're feeling 'lousy'." That is, what happens when you announce the term is that it's handled by virtue of subset membership.

Lectures 8 and 9 deal with the phenomenon, "Everyone has to Lie," which was later published in M. Sanches and B. G. Blount (eds), *Sociocultural Dimensions of Language Use* (New York: Academic Press, 1975), pp. 57–80. Because the published version exists, the transcripts of the lectures have been a bit more lightly edited, left perhaps a bit rougher than usual.

Lecture 9
"Everyone has to Lie" (ctd)

I'll continue talking about "everyone has to lie," and how a consideration of that statement might permit us to exhibit an instance of our warrantably saying about something that a Member says, that it's true. The long range interest of the exercise was in part to give us some additional materials which could be looked at and considered in terms of whether that's what a demonstration of truth for something a Member says, should look like. Where the analysis that's presented can then become material for its examination, so as to see whether that's what 'warranting as true something that was said' should look like, or not. We could pick out, then, components that seem to be important, others that don't, and move from it to other materials perhaps, to see what such a sort of proposal should look like.

Before going on, I'll briefly go over some of the things that were done last time. The idea was that 'greetings' as a phenomenon could have various of its properties explored and employed in building up a something that everyone might be sometimes said to have to lie about. One of the properties that was used was the ahistoricality of relevance. Another was that an exchange of greetings could constitute a minimal proper conversation for any subclasses of conversationalist; from what I called the largest subclass – who might do no more than that perhaps – to the smallest subclasses – roughly, people on intimate terms, who could surely do more than that but on some occasion could – without violations – do only that. That would provide that 'greetings' were, then, a minimal proper conversation.

Then there was the 'greeting substitute,' "How are you." There are perfectly well other kinds of greeting-substitutes, and they would be things that had just these properties: If they went without a 'greeting' they could be seen as a proper beginning of a conversation which would not be said to lack a greeting, but they could also be combined with 'greetings.' Such things as "Nice weather isn't it," "What a crummy day," etc. So 'greeting substitutes' are systematically different from 'greetings,' but they can be used where no 'greetings' are used, as a 'greeting.'

Then we also had the two classes: personal states consisting of things like mood, appetite, sleep, etc., and value states, a bunch of terms organized into three subsets [–], [0], and [+], where a prototypical term for [–] is 'lousy,' [0] 'okay,' [+] 'great.' And where subset membership is mutually exclusive.

Includes pp. 1–6 of the original lecture 10.

Then the point was made that although it's in its fashion curious that assertion of an answer to the question "How are you" would be used independently of the recipient's knowledge of the person he's dealing with – how he goes about measuring his states, etc. – those answers do seem to be usable and used in systematic ways. And, if the one who's been asked "How are you" is the first recipient, an answer which is a member of either [0] or [+] provides then for his use of "How are you" and a return from the other; or, if he's the second recipient, for an end of that sequence:

    A: How are you?
    B: Okay, how are you?
    A: Okay.
        ((end sequence))

Where, furthermore, you don't have to know the person you're dealing with to know what subset the term belongs to. That is, it's his business to use them properly, and not yours to figure out by virtue of what you know about him; e.g., that if he uses 'okay' he has some private subset intention. That's not to exclude the possibility that a given term can be used in such a way as to indicate that it is not its normal subset that's being named, but another. For example, the sarcastic "Great" which indicates 'not at all great, but lousy.' That introduces things like *intonation*, and I'll deal to some extent with that phenomenon eventually. But the very fact that by intonation you can indicate that 'great' is now being used as a member of the [–] subset is a very nice way to see that there is indeed a [–] subset, and a proper place for 'great,' not in the [–] subset. That is to say, the *positioned* character of these subsets and their terms as belonging to one or another, is something that is regularly, systematically available by considering the possibility of 'sarcasm' – where the availability of 'sarcasm' regularly turns on the positioning among items. And 'sarcasm' is something I'll consider some other time.

Q: Could you go over that again? What you said about you can't try to determine what they really mean when they say something?

HS: What they 'really mean' is what they say, for all intents and purposes. People have the conception that psychological terms are properly used by virtue of special knowledge of the persons you're dealing with. (And by 'psychological terms' I mean conventional, lay sets of terms like 'thinking,' 'having a reason for doing something,' etc.) Now that's a kind of thing that people who have had some university training are specially wont to insist on, i.e., "You don't really know about somebody until you . . . ect." But our language is not built in such a way. Persons use psychological terms with the same freedom and 'lack of knowledge of other persons' as they do any other terms.

And persons perfectly well figure they know what somebody is thinking; they know why people are doing things, etc., on the same basis that they know that they're 'white' or 'Jewish', etc., and on the same basis that they know what they're doing. We'll get to some of those things eventually, but

consider a statement like the one we have in the data:[1]

> *Roger*: When a cop sees a hopped up car, he don't care if you're goin'
> forty five you must be doin' somethin' wrong, and if he wants to
> be mean, he can bust you on a thousand things.
>
> *A1*: He doesn't have to have a reason, you know you're not s– cops
> aren't supposed to talk to you unle– s–stop you unless you're
> doing something suspicious. If you have a hotrod that's enough.
>
> *Roger*: He can bust ya on a thousand things non-moving violations if
> you give him any lip, even if you didn't do anything wrong. They
> can just go over your car and write you up ticket this long.

The general sense of it is, cops aren't supposed to stop you unless you've done something wrong, but if a cop wants to be mean he can go over your car and write you up a ticket this long. Where the core thing is 'if he wants to be mean, he can do X.' Now you might figure that the kids might well know what the proper rules are for giving a ticket, but how could they know that the cop was doing that by virtue of 'being mean.' But the decision that the cop was 'being mean' is no different than the decision that somebody is 'eating lunch.' The decision is arrived at via what they're doing.

In any event, the thing that I'm intending is that if somebody says "Okay" and they don't use it 'sarcastically,' etc., then what you understand is that they're naming that their state is in the [0] subset – 'normal,' whatever you want to call it. The consequence being that there is no need to now inquire into why that's so, or what's the matter, or what 'Okay' is for them or for yourself. It's our responsibility to use those things so that persons can make their inferences as they ought to. And we can do that for whomsoever.

So: I introduced those three subsets, their terms, their uses, and the fact that there are two different procedures, the application of which turns on what subset a term belongs to. If a term belongs to [–], then 'the diagnostic procedure' is properly employed, i.e., a procedure directed to determining 'what's the matter.' If, however, it's [0] or [+] there's no such procedure and the sequence is ended.

Then I introduced the notion of 'lying.' And if you're hung up on the fact that after all you can't use personal state terms unless you adequately know about somebody, so as to see how the terms are being used in some special way, then just consider again a thing like the fact that lying is perfectly observable, in the same sense that anything else is. In this case, what the notion of 'lying' involved was that there were two steps, one of which I called 'monitoring,' which consisted of finding the subset, and the second, which involved picking a term from that subset. What 'lying' involved was picking a term excluded by the monitoring operation. The monitoring operation gave you a subset and thereby gave you a set of available terms, and since the

---

[1] The data referred to was used in the considerations of lectures 1–7. A transcript is included in the Spring 1966 set, between lecture 2 and lecture 04.a.

subsets are mutually exclusive, it also gave you a set of excluded terms. And you 'lied' when you picked an excluded term.

I suggested that the notion of subset organization is crucial, by virtue of the following sort of thing: If you say you're feeling 'okay,' people will perfectly well say "You don't look okay, you look lousy" or "... you look great" or some such thing as that, but you don't find them saying "You don't look okay, you look normal." Or, if you say you feel 'rotten,' you don't find them saying "You don't look rotten, you look lousy." That is to say, the subset terms are somehow equivalent in ways in which others are not. And correction is by virtue of alternative subsets. Likewise, 'lying' would be claimed by virtue of it appearing that you're not in the subset, rather than that you picked a wrong term from the same subset. (There will be ways in which that concept of lying is quite generalizable, and I'll talk some more about lying when I get through this discussion.)

Now that's essentially where we were. What we know at this point is that if one happens to encounter someone who says "How are you," and one chooses the answer that happens to be 'correct,' then if that answer is from the [–] subset, it's their business to begin the 'diagnostic procedure,' i.e., begin to attempt to determine 'what's the matter.' It is interesting, at least in regard to those who have some notion of the special status of psychological terms or the privateness of emotions, etc., that you can perfectly well give an answer to pretty much anybody, no matter who it is, and they can figure that that's a damn good answer to why you feel lousy – again, even though they don't know you. "Why are you feeling lousy?" "My wife died." They perfectly well can be satisfied with that as grounds for your feeling lousy. Maybe you're joyous over it. Or maybe you haven't seen her for 30 years. Or maybe she died 30 years ago. In that regard, those things are radically standardized phenomena. In any event, there is some body of information that can be used to end the diagnostic sequence, once it gets started. There are a bunch of answers to "Why are you feeling lousy" which are adequate, and which persons do accept – again, without regard to that they don't know you, or do know you, etc.

The core issue is whether there is some regulation of the exchange of these items – forgetting for now about the sequence that can lead to that presenting of information, since there are other sequences which can just as well lead to that presenting of information. You could call somebody up and say "Isn't it terrible, I have to have an operation" instead of meandering around in front of their house until they came out and asked "How are you." So the presenting of that information is a something independent of getting found via this sequence. What we have to consider is the kind of regulations there are about requesting or presenting such information. Where, roughly, that information is anything that could be an answer to the question "Why" when the answer before has been "Lousy" to the question "How are you." Any kind of personal troubles, from extremely minor ones that happened this moment, to very large ones.

I take it that it's perfectly plain that the use of that information is indeed

regulated, and that one could lay out some of the terms of that regulation. That is to say, there are such things as: For some information it should be held within the family; for some information it should be told only to your doctor or your priest, etc. So some of these personal troubles can have extremely restricted legitimate audiences. There may be some troubles for which there's 'only one other person in the world' who has rights to hear it. Sometimes also, 'one other person in the world' who has rights to hear it first. And in that regard, there are various kinds of regulations telling you a sequence which you ought to use. If you're in such a trouble, turn to X first. Such a sequence can be quite important, and it can be quite standardized for all kinds of personal troubles.

There's a recent book out on dying.[2] And at some point there's a discussion of the sequence in which persons are informed about the fact that somebody has died. And that's not a random matter. You just don't call anybody up in any order. Consider, then, if somebody just died, and, for example, somebody calls you up who shouldn't hear now, though they should hear eventually. One of the problems there is that persons who hear such a piece of news properly tell others, and some people shouldn't hear it from certain people but should hear it from others. For example, the brother of the decedent shouldn't hear from a recent acquaintance, but should hear from, e.g., the doctor.

So there are a variety of personal troubles, and they are formulated in ways that can tremendously restrict who, at any given point, should hear them. Furthermore, one is not only concerned with those restrictions that say B doesn't have rights to hear that, but also that B shouldn't be burdened with hearing that. It's not his business in one of either ways, for anybody he would happen to encounter.

Now the regulation of those matters is quite independent of who has rights to say "How are you." As we've seen, pretty much anybody who has rights to say "Hi" has rights to say "How are you." The independence of the regulation of the presentation of information about personal troubles, from the regulation of the use of 'greetings' is, then, something that's quite important to the apparatus we're setting up.

You could imagine that if it were the case that you couldn't deal with some answer to a question like "How are you" that you might ask some person, then you wouldn't ask it. That is, knowing the set of possible answers, and knowing that you could not apply the appropriate procedure given some answer, you just didn't ask the question. That would be one way to regulate avoiding trouble. And that might stand as an alternative to its being the business of the person who is asked the question, to determine whether you can properly handle answers to it. It's clear from what I've already said that having it be the business of the person who asks, to consider whether he could handle any answer, would be impossible to accomplish since you might be the neighbor and best friend of somebody, and under most circumstances if they were 'lousy' they could tell you why, but there would be some circumstances

---

[2] The reference is to David N. Sudnow, *Passing On* (Englewood Cliffs, NJ: Prentice-Hall, 1967)

which you wouldn't know, that they couldn't tell you why. There might be that trouble occurring which you don't tell a neighbor or don't tell a best friend but tell somebody else, or don't tell a neighbor or best friend now but tell somebody else now.

One further importantly relevant matter is, it's not sufficient with respect to the regulations about talk about personal trouble, that somebody be an incumbent of such a category as could hear it (and questions about the special ways that membership categories are used will be considered in enormous detail). What I'm trying to point to is this: For example, it might be the case that you should tell your doctor about your pain. And you could say the rule is, if somebody comes up to you and says "How are you," then, if you're 'lousy' and if he's your doctor, then you could tell him what the troubles are, and you should give him the answer "Lousy." But that just isn't true. If you stand around, say, in a hospital, you'll perfectly well find that people who look like they're just about to die – and may be just about to die – will be sitting, say, in a wheelchair in the hall or in the dayroom, their doctor comes up to them, says "How are you?" and they say "Fine."

The issue is, is this interaction he's beginning a doctor–patient interaction or is it just a somebody who's passing you in the hall, who knows you, who is your doctor but isn't at this moment your doctor. That is to say, people belong to many categories; some of them provide that, in general, if you see this person you greet them and no more. Doctor–patient may well provide that under no circumstances except the business interaction may you provide that answer which will then provide for the diagnostic sequence. What one has to determine, then, is not merely that this person is indeed your doctor, but what he is for now. And that he is your doctor may not mean that he is your doctor for now. The fact that you can determine that he is a member of a category which can get such an answer doesn't mean that he gets it now. And that kind of thing that holds for doctors, holds as well for other things on some occasions.

What we have then is: Whereas it was at least initially theoretically possible that potential *askers* would consider whether they could handle any alternative answer before they ask, we saw that that can't work in general. It appears to be the business of the *respondent* to provide that the asker doesn't have to do what he isn't entitled to do, or the respondent isn't entitled to ask him to do. And the way that's controlled is by restricting the subset that you're going to pick answers from. Depending upon 'who it is you're dealing with.' Where they, however, don't have to restrict what they can greet you with – at least within the boundaries of "Hi, how are you," etc.

So there would be some persons who you meet, for whom [–] is always out, others for whom [–] is out sometimes, etc. Where, if they ask "How are you" what you do is 'lie,' i.e., pick an answer from a subset that was excluded by the monitoring operation, if it happens that you are in the [–] subset. You can't announce that one to them by virtue of that announcement generating the diagnostic procedure which they have no business doing for this item at this time.

Now, it isn't in the first instance obvious that 'everyone' will be, has been, at some time or another, confronted with that situation of being in one or another way in some personal trouble and having somebody come up to them and say "How are you" who isn't entitled to know what that trouble is. That could hardly be a basis that anybody would have available for making the statement "everyone has to lie." One can't imagine that somebody could come to know that everyone has to lie by virtue of having collected, by observation, that everyone – even everyone they know – has on some such occasion lied.

That it's 'everyone' turns, I think, on this: That there isn't any available way of telling that it won't happen to you today or tomorrow or next week. That is to say, there aren't procedures for excluding anyone. If you're up and about and meeting people, then it may well happen, given, say, the variability of moods and the chances of life, that you will be in a circumstance such that you have some information that some person ought not to have, and if they say "How are you" they might get it. There's machinery for providing that, and there's no machinery that says 'this will not happen to you.' There's no way of excluding that kind of thing for anyone.

From the beginning, 'has to' has been left open as to what it would involve. But, for example, one can use 'has to' correctly, not only in circumstances where 'there's nothing else in the world you can do,' but where there's some rule that tells you to properly do that. 'Everyone has to pay their taxes.' You don't have to pay your taxes, you can go to jail instead. That is to say, the scope of 'has to' can apparently be appropriate with respect to some kinds of rules. So that if you ought not to tell people why you're feeling lousy, then with respect to that kind of rule you may 'have to' lie. We can then see in part how persons could be in a situation in which there would be machinery which would involve them in *choosing*, say, between lying or not, i.e., choosing whether to say 'lousy' or something other than that.

At this point it would be perfectly interesting to say that we can see how it is that 'everyone' is in a position to 'have to' *choose* whether to lie or not. Where, if I had said at the beginning, "Wouldn't it be nice to see whether everyone is in a position to have to choose whether to lie or not?" nothing could sound less interesting – though it might well sound interesting to know that "everyone has to lie."

Now, the notion of 'lying' that we've developed for the "How are you" situation is generalizable, and I want to offer that generalization and then consider some of its importance. We've noted about the "How are you" situation that what provided for the dilemma that could lead to having to lie was the fact that: Given that the answers were seen to invoke subsets of the set of possible answers; and that subset membership is exclusive; and that, dependent on which subset is invoked there are different consequences. Thus, if [–] were invoked, a procedure was properly applied, what we've called the 'diagnostic procedure,' one directed to developing an explanation for one's state; whereas if the other subsets were invoked by an answer, that procedure was not employed, but either the sequence ended, or, if the answerer had been the first questioned then he might return the question.

The fact that persons may lie in this situation of giving an answer to "How are you" involves us in seeing that they can be oriented to the different consequences of their alternative answers. We may construct a generalization of the situation under which lying is expectable, in the following way: If there is a situation of questioning where the answer is a 'which-type' answer (i.e., the alternatives are known in the first instance as possibles) and where to these alternative possible answers there are properly attached different procedures which are applicable given the particular answer, and where those procedures are differentially consequential – either directly or otherwise – then it is expectable that the differences will be oriented to by answerers and they may attempt to control the use of one or another of the procedures by producing answers that are constructed by reference to those procedures' use, and not to what happens to be the case, i.e., what is otherwise the 'correct' answer, and known to them as such.

What I am proposing here is not so much that I can tell you where to look to find that people will turn out regularly to be lying, but that: If one locates situations characterized as above, then what one will find is that questioners and answerers will regularly expect that persons will be found to be lying. Thus we can locate the situations where claims of lying – or claims, before others have been raised, of *not* lying – will be found. That is not all. What is in its way quite interesting is that both of the following are true: First, that in such situations – as in "How are you" – it is not *any* answer of the alternatives that will be treated in the first instance as a possible lie. And second, that if an assertion that a lie has been made, is made, and it is acknowledged, then we can locate the circumstances, not only under which the assertion can be recurrently made, but also under which the confession will be believed. Only certain answers will be seen as 'possible lies.' If such an answer that is seeable as a possible lie is made, and it is called a lie, and that is confessed to, it will be believed.

This sort of generalization is of interest since it involves a confirmation by quite independent materials, of the formulation we made of lying. And it indicates that lying as a phenomenon's expectability for Members, is something that has systematic bases, and that only certain alternatives of such systematic alternatives are so recognizable, and where such a one has been done and confessed to, that repudiation of it now, is believed.

This has various subversion relevances. For one, consider that the analysis can be used to locate situations in which, if one's task is merely to lie undetectably – lie in such a fashion that, though 'lying' is attended as a possibility in that situation, your answer will not be so seen – then the analysis tells you how to do it. It may further be noted that this possibility of the non-expectable lie is one that has been used, at least literarily, to formulate a type of hero: That fellow who, e.g., confesses to another's crimes and bears the burdens of another's guilt, and who, in confessing, does something that is not seen as a lie, where it is denials that are expectably lies.

What is thus being emphasized and what is of real interest to us, is that the generalization of the lying situation provides us with an expectation of where

persons expect lies, and provides us further with an expectation of what sort of answer in such situations they treat as 'possible lies.' What we get, then, is a way of seeing that lying proves that persons do orient to, and are expected to orient to, the procedural location of their answers, and to produce answers not just by reference to the question that elicited them, but also to the various uses that that answer may have for next actions that may be done.

The fact that persons are so oriented, and that they are recognized by others to be so oriented, has as one of its consequences that wherever such a situation in which lying, as thus systematically expectable, is present, then one would not readily be able to treat an answer as 'just an answer to the question asked.' One would not be able to treat a set of answers as independent of each other, attached merely to their respective questions. And that sort of issue is of some importance in various decoding operations in questionnaires, and issues of statistical treatments of responses. It is in those areas that lying is an important possibility. But the importance does not turn on such a fact as, e.g., that some percentage of answers may not be true, but on the fact that the answers are produced in such a way that the methodology for treating answers is not applicable if conditions such as 'independence' need be assumed to hold for the various answers. And it is because of that that it is no solution to the problem posed by the possibility of lying, to 'allow a margin of error equivalent to the reasonably expectable rate of error due to lying.' Its import is rather more drastic.

And, for example, the fact that persons can lie, and that they lie in appropriate circumstances, is very good information as to their grasp of reality. Why should that be of any interest? Consider the following. When children begin systematically to lie, you have tremendous information about what they're beginning to attend. Whereas lying is, e.g., treated as 'when children begin to lie, isn't that a terrible time,' it's instead information about their orienting to larger and larger sequential structures and their conse-quences. And those are matters which can turn out to be terribly important; e.g., that they can orient to 'danger.' In that regard, then, the emergence of lying for children is something to be attended.

Now, earlier I said that if we could give a systematic account of a certain sort, of the truth of "everyone has to lie," one of its possible interests would be that we would begin to have evidence that the structures which generated the occurrence of lying were somehow available to Members. And that would begin to tell us what kinds of abstract analyses of the social structures they had available. Where one very non-trivial consequence of that is that in going about assessing talk, we're forced by the phenomenon of 'lying' to attend what kind of treatments alternative answers can get, are known to get, i.e., what structures they're parts of, so as to see what could be going on in the production of answers.

But it should certainly not be said that the fact that somebody can say that "everyone has to lie" proves that there are ways in which the analyses are laid out and are already known by Members. For one, they say all kinds of things. Presumably under some random production of talk, some of the things they

say would be true. If, however, various of the parts can be shown to be analytically available to them – like the systematic ways they would be found to be in a position to recognizably lie; change their lies; lie believeably, etc. – all these things can begin to be used to fit together the fact that such a situation is available to them.

In the case that we have at hand, the dilemmas involved in "How are you" can roughly be gotten by, say, considering the kinds of advice on such matters one finds in etiquette books. Here are a couple of quotations which exhibit that in their fashion Emily Post and Amy Vanderbilt were attentive to these kinds of circumstances. The first one is from Amy Vanderbilt's *New Complete Book of Etiquette* (1963), page 212, from a section entitled 'A guide to tactful conversation.'

> In greeting people we say "How do you do." We do not really expect an answer but it is alright to reply "Very well thank you" even if it is a Blue Monday and you feel far from well. No one wants a clinical discussion in response to this purely rhetorical question. In fact, you may answer Socratically with "How do *you* do," expecting and getting no answer.

That was Amy Vanderbilt. Here's Emily Post from her book called *Etiquette* (1955), pp. 16–17. A section called 'The answer to "how are you".'

> The trait of character which more than any other produces good manners is tact. To one who is a chronic invalid or in great sorrow or anxiety, a gay-toned greeting, "Hello Mrs Jones, how are you, you look fine!" while kindly meant is really tactless, since to answer truthfully would make the situation emotional. In such a case she can only reply "Alright, thank you." She may be feeling that everything is all wrong, but to 'let go' and tell the truth would open the floodgates disasterously. "Alright, thank you" is an impersonal and therefore strong bulwark against further comment or explanation.
>
> As a matter of fact, "Alright, thank you" is always the correct and conventional answer to "How are you," unless there is reason to believe that the person asking really wants to know the state of one's health.

In his book *Behavior in Public Places*, Erving Goffman has a discussion of the sociological usefulness of etiquette books, and people who feel that things like etiquette books are laughable, might read it. You wouldn't laugh at it if it were called 'Description of interactional requirements among the Ubangi.'

Lecture 10

Lecture 10 was almost equally divided between finishing up the consideration of "everyone has to lie" and starting off a consideration of 'We' that continued on through lecture 11. The first part of lecture 10, then, has been incorporated into lecture 9, and the second part into lecture 11.

Lecture 11
'We'; Category-bound activities; 'Stereotypes'

Ken: We were in an automobile discussion
Roger: – discussion' the psychological motives for
Al: – drag racing on the streets.

I am going to begin a consideration of 'we' in "We were in an automobile discussion." One interest we would have in 'we' would turn on trying to figure out how it is that somebody who hears it would go about determining to whom 'we' refers. Are there ways available of solving 'we'? In more or less naively considering ways of solving 'we,' you might pose the problem as something like this: Of the various people 'we' *might* refer to, which of them *does* it refer to? Then you might consider, say, the set of persons in that room, and go about including or excluding one or another.

But 'we' is kind of a special term, and I want to do two things. One of them is to point out its complexity, and the other is, while doing that, to introduce some considerations relevant to dealing with 'juxtaposable sentences.' What I mean by that is, when, in the past, logicians went about considering natural languages and their utterances, they engaged in constructing sets of contrary statements, or considering whether one sentence implied another, etc. Where, if you could get contradictory statements, and both were admissable, you had interesting troubles.

The burden of the kinds of remarks I'm going to make goes to the issue of: What are the circumstances under which two seemingly perfectly well juxtaposable sentences are in fact interestingly juxtaposed. For example, if we had '*We do X*,' '*I don't do X*,' we might ask: If those two are admissable isn't something strange? Those two shouldn't be admissable. 'We do X' ought to imply 'I do X.' I'm going to be looking at pairs of sentences like that. The line we'll take is that before deciding the juxtaposability of two sentences, one ought perhaps to see how either one or both are in the first instance – forgetting about juxtaposition – *warranted*. Then perhaps consider the procedure that warranted them as telling you something relevant about what it is that that utterance is saying – where it would be by reference to that procedure that the question of their comparability might arise, or might turn out to be not at all of interest.

I want to treat as primitive to these purposes, statements of the form '*Y do X*,' where 'Y' is some category of persons. 'Women are fickle,' 'Jews cheat,' 'Negroes smell.' Now, it's not any category plus any verb, but a relationship

like the above. And we're not concerned with whether they're true, false, or whatever. Those are just 'known things;' known whether they're correct or not. We'll be considering in part, some of the relations between those things and various possible consequences, and possible non-consequences, of them.

Let me begin with an instance of the sort of thing I mean by 'warranted' statements and their derivation. Consider the following kind of thing. A person can say "I don't smoke" while they're smoking, and it's not anything that's directly usable to convict them of inconsistency or lying. We have it in our data, as a matter of fact. The question is, what are the conditions under which one comes to say "I don't smoke," warrantably. It seems to be the case that one is in a position to say "I don't smoke" if, e.g., when one is offered a cigarette one says "No thank you I don't smoke." People routinely say, not merely "No" when they're offered, but also or only "I don't smoke." And that's in the first instance how they come to be saying "I don't smoke." I suppose what's involved is, if somebody habitually doesn't do something that people do habitually if they do it at all, then that they happen to be doing it on some occasion is irrelevant to their being able to say that they don't do it. "I don't smoke" is directed to, say, the *habitual* character of the non-smoking. So that, for example, if there happened to be a discussion about smoking – or any such thing which you might turn down with such a sentence; for example, drinking – you perfectly well may say in the discussion, "I don't smoke" or "I don't drink," even if in that discussion or on some other occasion you could be found smoking or drinking.

What is of interest here is the preserving of the use of "I don't smoke" out of a history of doing refusal with the use of this item. Where, then, loss of the right to say "I don't smoke" is independent of one's being found on any given occasion to be smoking. It would turn on buying cigarettes, no longer doing refusals, whatever else. If somebody who, say, never turned down a cigarette in that fashion were on some occasion to say "I don't smoke" while smoking, you might figure you could do a conviction or that there was something puzzling. But as long as they were engaged in refusals in this form, they could use the statement on other occasions. It seems that persons perfectly well do that.

Now I'm treating these '*Y do X*' statements as premitive for the following sort of reason. Suppose a bunch of people, A, B, C, do X. Then you might figure that if A, B, C are each Ys then you could say '*Y do X.*' And that's not true. The fact that they're all Ys doesn't mean you can say '*Y do X.*' You can only say '*Y do X*' if there is already a Y for that X, or if, under some procedure which I have no idea about – and I don't think anybody else does – you're going to build a new case of a Y for that X. So, for example, if it's after a baseball game and three players are standing there smelling, and one of them says "Protestants smell," that doesn't go. It's queer. And besides, if it were done it would be seen as some kind of a joke based on a replacement of some other Y that smells, which is already known.

---

[1] See the Spring 1966 data handout, p. 278. Al and Roger are smoking cigars, and Roger says "I don't smoke."

The sheer fact that a population of persons can be found to be cases of some one category doesn't mean that you can then build a characterization of the 'Y do X' form with that category. But – again to see the primitive character of 'Y do X' – if A happens to be a person in a category for which there is one of these statements, and you see A do X, you can turn to somebody and say "They always do it." And that involves a series of kinds of things.

For one, you say 'they' always do it. You don't say the Y that A is a member of, you use a pronoun, but it's perfectly well seeable what Y it is. And you're not even using a correct pronoun. That is to say, there may perfectly well be only one person doing it, and nonetheless you can use a plural pronoun. (That's one of the interesting ways in which our notion, say, of pronouns being differentiated into plural and singular, and the conditions for the use of, say, a plural pronoun being that there is more than one person being referred to, doesn't directly capture the kinds of things that seem to be involved.)

'We' can be used in exactly the same way. There are places in our data in which, for example, Roger says to Ken, "You're a poor little rich kid" after which Al says "Now you're a poor little rich kid, we've told you that." And you could read that to say: In Al's statement, he also having said it, 'we' is correct by virtue of his also having said it. That is, as compared to its obvious reading: Al is treating what was said by Roger as said by both of them, in some way perfectly entitleable to be done. (Though again, if a kind of enthnographer were reporting the event he would presumably say, not "Roger and Al did this action," but "Roger did this action." And that's kind of important because if ethnography is supposed to be producing at some point the kinds of characterizations that are, for Members, correct, then you would have to know, say, what a Member in this scene would be making of this scene. And that involves for one, correct characterizations of the persons involved. And, possibly, correct pronouns. Seeing what was done 'on our behalf,' 'on my behalf,' 'not on our behalf at all,' etc.) There's another such scene in our material. Al and Ken are wisecracking about the possible observer to the session, and Roger says "Now don't carry on like that, they'll think poorly of us." Where for that use of 'us' he could say – and presumably somebody who doesn't have the procedures available would have to have said – ". . . of you" (singular or plural).

So on the one hand what we find is that if a single person does something, there are conditions under which it can be said, "They do" (or "They did") and it is perfectly well acceptable. And you can lay out what 'they' will be heard to be, by virtue of reference to one of these 'X do Y' premitives. And alternatively, the fact that a bunch of people are all members of a Y category and they all do something, doesn't mean that you can make a new acceptable statement of the 'Y do X' form, i.e, that having a known Y, you can make a new X for that Y.

And if you have a statment of the 'Y do X' form, then those plural pronouns are usable. If you're not a member of Y you can say "They do (or did) X." If you're a member of Y you can say "We do/did X." Further,

you're in a position to be able to say "We did X," altogether independently of being in a position to say "I was among those who did X," i.e., "I did X." You get to be able to say "We did X" by virtue of 'Y do X' being known, and your being one of those persons who can use 'we' for Y, on whatever occasion you happen to be using Y. It has nothing especially to do with any use of 'I.' So that, for example, 'we' can get used for achievements of the race, of the nation, etc., where no participation was involved. And again one wouldn't convict somebody who came up to you on the campus and said "We're going to play USC tonight" or "We beat USC yesterday." That is to say, one wouldn't say to them, "Unless you can say 'I was among those who beat USC yesterday' you can't say 'we beat USC'."

It's possible of course for some person that both 'I' and 'we' are true, by virtue of, say, his being 'on the team,' one of those who did whatever was being done. But again, 'we' does not necessarily imply 'I,' and the fact that 'I' is usable doesn't necessarily mean that 'Y' is usable – that's arrived at in another way, i.e., you may be one of those A, B, C who are doing something, but the question of how that is to be formed up as a plural phenomenon with some category, is independent of that you can say "I was among them." And once one abstracts all those matters, then one sees that the question of which ones are to be juxtaposed, or which ones are consequential, has to be arrived at according, say, to those rules of use for each one of them.

I want now to focus on the fact that 'we' is a pronoun, and get to a consideration of what relationship there is between statements with those categorials and statements with pronouns. Let me first go through a variety of the ways that pronouns get used, so as to set up some of the issues involved in dealing with them – particularly dealing with 'we' – and then we can get some of the 'variables' involved in fixing in on particular usages and what they may be doing, and what may be involved in analyzing them. And also, then, to see that even though it's obvious that some given usage is doing some particular task, that one can't in doing an analysis, simply state the obvious – "He's obviously excluding Z because he uses 'we' not to refer to Z" – because that wouldn't give you a rule that would hold for other uses of 'we,' and 'we' may not be the only thing involved in such a use.

First of all it's very frequent that if somebody has used a categorial, then later speakers can use 'we' or 'they,' preserving reference to that earlier categorial. "Kids don't drive long . . . ," "We do race." 'We' preserves 'kids.' The choice involved there is to use a pronoun instead of a categorial – and also, which of the pronouns will be used. And in that regard, we can notice that Roger in his statement uses 'they' in the first place:

> *Roger*: Kids don't drive long. They start off when they're si – by the time
> – when they're sixteen, by the time they're eighteen they're back
> walk(hh)ing hehh

whereas in later uses he'll clearly be considering himself such a one; i.e., a 'kid.' So it's not apparently required that for all uses, if one is a member one

use 'we.' And I'm what saying about 'we' does not imply any usage of 'I' at all; it's not the case that automatically if one finds 'we,' 'I' can be used.

In any event, if a categorial is used, then one can refer back to it via certain pronouns, particularly 'we' and 'they.' One would then read a pronoun as a term which is instructive in the sense of it constitutes an instruction to search for such a noun as it could be referring to. That's a very conventional, textual use of pronouns. For one, it's very often found in extended texts, that after a noun has been used, some pronoun is then used to refer back to it, tying the various sentences or statements into some sort of package.

I want to restrict attention to categorials-and-pronouns, and not consider nouns-and-pronouns generally. That is, not to consider as singularly control-ling, syntactic considerations which would operate for nouns and pronouns generally. There will be a lot of things that syntax would permit, that on the one hand do not seem to be permitted, and furthermore do not seem much to occur.

Secondly, there are matters which specifically turn on conversation. For example, matters of 'address.' And here what you have is a series of different results which all look alike in their 'realization' – the utterance. So, for example, if one is talking to some other person or several other persons, for some kinds of things one says, one can always use 'we' inclusively of the recipients of one's utterance. As a matter of address one can say 'we' inclusively. It isn't a matter of 'feeling like we're a we' in the sense in which one talks about it; of being co-members of anything other than the conversation. You can perfectly well get "We never agree," "We certainly do fight a lot," etc. It's not a matter of persons being co-members of anything much but the current conversation, but that there are address rules which permit the use of 'we,' inclusive of them and yourself, to whomsoever you're talking to. And that can be one other person, two others, thousands of others. Now that situation is quite different than the conventional textual use.

It's also the case in conversation that one can be using pronouns for reference purposes, independently of the first usage and differently than the second usage. Consider, say, a situation in which A is addressing B, and in addressing B uses 'you.' B may then return with 'we,' where 'we' can apparently be heard as exclusive of A and inclusive of B and somebody else:

A: What did you do last night?
B: We went to the movies.

One can then get series of different strings of 'we's, some of them being preservatives of earlier 'we's:

A1:   We do race but the times we do get tickets are the only times when we maybe goin' a long distance . . .

others being exclusive strings, i.e., the 'we' of the first excludes the 'we' of the second:

A: What did you do last night?
B: We went to the movies.
C: We stayed home.

One thing to be noted, then, is that 'you' and 'we' are alternative ways of doing address. Now, 'you' as an address term can be quite interesting, because it often does have *categorial import*. Persons often seem to use 'you' in such a way that we might call it a *'local representative'* of persons who, were the one called 'you' not present, would be referred to as 'they.' Where it's not obvious that everybody not present would be referred to as 'they.' Plenty of non-present people can be referred to as 'we;' for example, the case of "We went to the movies." And if 'you' is heard as a local representative of 'they,' those 'they's are characteristically some category. Further, one notable thing that follows from 'you' being a local for 'they' is, if you have a simple arrangement of the pronoun terms, 'you' is 'second person' and 'they' is 'third person.' And in that sense, the terms would be treated as, if you want to refer to a singular 'they,' you would use 'he' or 'she.' But the old chart: I, you, he, she, we, you, they – is not the only way it works.

Once we get into the issue of address, and particularly to that of directing an utterance to somebody, as something that can go on in conversation, then one finds some uses of terms like 'he' and 'she,' which tend to be treated as terms that refer to somebody non-present whereas they're not at all necessarily that sort of thing. One characteristic use of 'he' involves this sort of thing: A person is present and has just talked. The current speaker is picking up something that one said. If the current speaker used 'you' as the subject of that utterance, then that utterance would be re-directed to the last speaker. If what the current speaker wants to do is not direct the utterance to that last speaker but not necessarily exclude that last speaker from speaking, i.e., just leave the matter of who should talk next open, then one way to proceed is to use 'he' as the subject. For one thing, such a use needn't mean that such a person is being treated as 'not one of us.' So, for example, in our data pretty much every one who is ever referred to as 'one of us' is also in some utterance referred to as 'he.' So in that regard, somebody who can be referred to as 'we,' can also be referred to as 'he.'

Then there are other matters with respect to 'we' and 'they.' Earlier I mentioned that if A did something that B is talking about, and if A and B are relevantly co-members of something or other – relevantly to what A did – then B may say "we did" that thing that A did, i.e., he may treat A's action as having been 'on behalf of' A and B, or A and B and others, or a category that A and B belong to. In which case you can have a situation in which 'we' is used for some action that you would otherwise – if you were watching it, or for all A knew who did it – think was done by a singular doer, and not a plural, which 'we' proposes about it.

Note that that's often done with intentions of turning A's action into a categorial action, i.e., such a thing as 'we do.' And the converse is also found, i.e., where A did some action and B, in talking about it, will say "They do

0that sort of thing" or in various ways use 'they' to refer to that action. And there, it will turn out to be quite clear that some categorial is being intended by 'they.' (We leave aside now the question of how that categorial can be found, and that a single categorial may be seen to have been intended though not mentioned, and why somebody would choose to use 'they' or 'we' rather than the categorial term.) So we can see that there are some relatively systematic relations between some of those, i.e., just as singular actions can be treated as something that 'we' did, so, too, can another singular action be treated as something that 'they' did. The instruction that 'we' or 'they' would be treated as giving, would be 'find the categorial' – not necessarily a mentioned categorial.

Of course 'we' or 'they' can also be used in the fashion I talked of as 'summative,' i.e., if A, B, C do some action, then if A is speaking he can say 'we.' And there, there may be no issue of a categorial, or for that matter any singular noun that would be intended, invoked, etc. Similarly, if B, C, D do an action, A talking about it can talk about 'they.' Now one way in which such usages become possibly interesting is where it's not obvious that A, B, and C did some action – in the sense that it may be perfectly obvious that A did something, B did something, C did something, but that they are treatable as something that A, B, and C did for purposes of 'we,' is something you can then learn from the use of 'we.' For example, A asks a question of E, B asks a question of E, C asks a question of E. If one of them says "Well, we've been questioning you for ten minutes," then that those things are treated as having been done 'serially,' say, where each of them in some way participated in a series, is an independent issue in part from that A, B, and C asked single questions. And that matter can then come up in cases of, say, those actions which are specifically plural but where each of the parts are done by a single person. That they are parts of some plural can be picked up by virtue of uses of 'we' or 'they.' For example, 'taking a side in an argument' is something that might be picked out of A taking a position, B taking a position, C taking another position, and then D saying "A and C and I have been arguing with B." As compared to what might otherwise have to be treated as pairs of alternative positions taken by A and B, B and C, etc.

Part of this can be summarized by saying, roughly, that terms like 'we' and 'they,' when apparently used for actions done by single persons, will not be found to be used for *any* action. They're not randomly distributed. And the kind of order that's involved in them can then be a matter of interest, something extracted, and something, then, that informs us about the way in which actions are seen as coordinated. Not any action that A does will be said by B to be something 'we' did or 'they' did. And one can look to see which ones and what kind of properties they have. But you also have to attend whether it's the case that the pronoun is being used *only*, e.g., to do a directed utterance, or to treat some prior utterance, or to invoke a category, or to do *combinations* of them. That is to say, we can get clear cases of each sort (how they are clear cases is of course a problem), but then we get more or less intricately combined cases. But, as I say, there are some initial positions you

can take so as to begin to lock in on the stuff. For example, if what seems to be going on is 'referring to some action initially done by A, as done by "we",' then you can see that something special is involved because you won't find that being optional for any action. You get a set of such actions, and you find that they're quite restricted. (And by the way, it's also perfectly okay for a single doer of an action to refer to it as something 'we did', i.e., it's not necessarily required that the doer say 'I did' and that only another can say about it that it was something 'we did.') And it will often be the case that one might want to leave the 'we's and 'they's aside, because it turns out that the populations of speakers will reverse them. That of course is quite interesting. It will tell us about agreed-upon formulations of the action as categorial, independent of the group that's treating it as either their sort of action or not their sort of action, or some specific other sort of action.

With that kind of stuff at hand, even if we're going to say that 'we' should in the first instance be treated as an instruction of some sort, the sheer occurrence of 'we' is not going to tell us what kind of instruction it is. And furthermore, it's not going to tell hearers what kind of instruction it is. That they can nonetheless perceive it, means that there must be some way in which they are able to find what instruction it is. Which may then require us to deal with other things than 'we' in determining its use.

Just as it's not the case that the use of either 'we' or 'they' for actions done singularly is random, so, too, combinations of some categorial with some verb like 'kids race cars,' 'kids drive fast,' are not random either. The range of possibilities is huge since, given that one is dealing with verbs that take human nouns in the first place, one can put in any or many human categories if one can put in one of them, and get perfectly grammatical utterances. It is nonetheless the case that you do not get *any* pairs uttered. And each such pair is then something to be considered.

Of the pairs '*Y do* X,' whatever they are, at least some of them have a set of uses, ways of being dealt with, consequences, etc., which are quite general to that set. So that the sort of things done with 'women are fickle' is formally similar to the sort of things done with some other 'Y do X.' And rather than it being the case that you ought to be puzzled by a person saying 'We do X' and then also saying 'I don't do X,' the uses of 'I don't do X,' i.e., those verbs with which it is combined, are almost a signature of the existence of a statement of the form 'Y do X' as a known thing. The situation is partly similar to that of absences. Just as it's imaginable that people can say on any scene that something didn't happen, and they don't do that but, rather, proceed in quite regulated ways in referring to absences, so also it's the case that things that are said to be 'things I don't do' could also be treated as indefinitely extendable and therefore trivial. But again, they're used with great caution. And the specific basis for their use is typically that one is a member of a categorial, and for that categorial there is such a statement as 'Y do X.' Where, that statement being known provides the relevance of 'I don't do' such a thing.

Furthermore, one can rather generally state the kind of activities that statements of the type 'I don't do X' are. They can regularly be one of two

sorts of things: 'complaining' or, say, 'boasting.' If you take the case of 'complaining,' you might begin to locate what might be complained of by taking what can be specified to be something valuable attached to some group – that the group thinks so or somebody else thinks so – and just negate it, then you can get expectable complaints from one who is a member of that category. And you can begin to get some sense of the status of those 'Y do X' statements with respect to things like 'truth.' It often isn't the case that the juxtaposition of 'Y do X' and 'I don't do X' means that therefore 'Y do X' is false. It means "What's the matter with me that I don't do X." And what it involves is then trying to set up a program whereby you can come to be a proper member of Y. And of course you don't need the juxtaposition of statements on any given occasion. Sheer membership would provide for the observability of one not doing X, where it's not just anybody who would notice "I'm not doing X."

In our data you can see, for one, that "Kids do race" would seem to be such a thing, not only in the sense that 'everybody knows it' but also as something that for members is valuable. Such that Al, for one, has got to justify how come he doesn't get tickets:[2]

Roger:	I̲ have got a speeding ticket, on the average of one every three an' a half months.
	(//)
Roger:	Since I've been driving.
Al: →	I haven't – I have never go̲tten a // ticket.
Roger:	A:n' I dese̲rve it.
Dan:	ha ha // ha hhh hhh
Roger:	I dese̲rve it.
Dan:	hhh // ((softly)) ( )heh
Roger:	Because–
Roger:	I always drive, about seven miles an hour faster'n everybody else.
(Dan):	((very softly)) (//)
Roger:	Y'know?
(Dan):	((very softly)) Yah // mm hm,
Roger:	Like, everybody's driving thirty five, I'm drivin' 'bout forty two something (like that).
	(/)
Roger:	So this's the conseque(hh)nce I hafta pa̲y. Cause I can't stand driving that slo̲w.
Al: →	I've – I've – I've – All the time // I've been driving, I haven't gotten a ti//cket,
Roger:	Specially when I think I can –
Roger:	– handle a car at that // spe̲ed.

[2] The data is not shown in the original lecture. The excerpt is taken from the Spring 1967 data handout, slightly simplified.

Al :	But I've always –
Al :	⌜But I've always –
Roger :	⌞(in traffic.)
Al : →	I should've gotten a // ticket but uh
(Dan) :	((very softly)) ( )
Ken :	Oh I c'n think of a million times when I̲ should've gotten a ticket . . .

That is, getting tickets would be something he would seemingly be proud of. That he doesn't is something that people may complain about of him, and which he has got to justify. He does it quite voluntarily. But, given the announcement by Roger that he gets tickets, the rate at which he gets them, and given the earlier discussion, "Kids don't drive long," etc., you'll find people like Al volunteering that they don't have tickets, and explaining why they don't. And that sort of thing will be found for all sorts of things in which you have, in the first place, one of those 'Y do X' statements.

I'll just make a passing remark. Lots of people think that these things – often talked about roughly as 'stereotypes' – are terrible sorts of things, and the world would be a lot better if we did away with them. In that regard I offer a caution: One of the basic ways they get used is, if some action is done and one wants to find who did it, the existence of a 'Y do X' statement is an instruction 'look for such a one.' Or, if there is a somebody to whom something happened and now your task is to identify them – where they could be identified in many ways – then the existence of such a statement tells you which one to use.

If you remove the statements you couldn't get things like this: You read in the paper, 'In the last year and a half 26 Negroes were killed in the South, in unsolved murders.' Now people who don't like a statement of that form, in that it can be used to enforce prejudice, etc., have got to consider that if you remove 'stereotypes' what you lose is how to classify those 26 murders. There were, say, 124 murders in the South, and we're dealing here with 26 murders that nobody knows who did. If nobody knows who did them, then nobody knows why they were done. Then the question of how to classify them becomes systematically impossible to handle, i.e., you go through a list of the persons with, then, lists of traits: This person was a man, he was such and such age, etc. Now the idea that it was the murder of a 'Negro' already sets up how it is you're going to go about finding who did it. That categorization which starts from some relevancies independent of a single action, permits you to go about, e.g., doing an explanation, or searching out how the thing could have happened. And ordinarily, if you have a singular recurring action, and you get a statement "we do that" or "they always do things like that," what's involved now is not simply that one is proposing to have categorized it as the actions of such people, but to have *explained* it as well. If you can turn a single action into 'a thing that they do,' it's thereby solved.

Lecture 12

Category-bound activities;
Programmatic relevance; Hinting;
Being 'phoney'

I want now to deal with a few edges of the 'Y do X' stuff. I call some of the statements of that character '*programmatically relevant.*' And I initially intend to notice by that term, the stuff I've talked about by reference to 'I don't do it.' That is, if there is a 'Y do X' statement, and you're a member of some category Y for such a statement, then if one comes to say things like 'I don't do X,' one treats that on some cases as a problem one has, to be remedied by some course of action, i.e., so as to bring oneself under the auspices of the statement. The statement is preserved, and various persons who are incumbent in the category of that statement go about arranging their lives by reference to making the statement 'more correct,' perhaps. That is, you don't use your state to falsify the statement. Instead, your state can be 'defective' by virtue of the statement. The idea is, then, that there are various programs which persons can generate so as to satisfy their being one of those for whom that thing is so.

In that regard, the statements can constitute kinds of advertisements. If something is known about, e.g., what lawyers are like, then persons can pick a religion, pick a place to live in, pick people to be with, so as to have themselves fitted into the formulation. And there are other matters involved in that sort of thing. For example, each person may find themselves instructed that it's their business to maintain themselves in such a way that the correctness of what is known can be seen in their actions. "Remember, you're a lady." That is, people will see you and see you via that thing, and see that it's being upheld. There are many other uses of these sorts of things, but I'll leave that aside for the moment and start somewhere else, with respect to something that will partially merge with what we've already got, and will also set up some further problems.

It's a perfectly obvious fact that there are other ways of doing identifications which intend a category (identifications of oneself or of others) than by announcing that 'I'm a such and such' or 'he's of a such and such group,' etc. I want to be interested in several of those other ways. Here's a quotation from a piece of data. A conversation between a suicidal man and a psychiatric social worker.

P: So you can't watch television. Is there anything you can stay interested in.

S: No, not really.

P: What interests did you have before.

S: I was a hair stylist at one time. Did some fashions now and then. Things like that.

P: Then why aren't you working.

S: 'Cause I don't want to I guess. Maybe that's why.

P: But do you find that you just can't get yourself going.

S: No. Well– as far as this job goes?

P: Yes.

S: Well, I'll tell you. I'm afraid– I'm afraid to go out and look for a job. that's what I'm afraid of. But more, I think I'm afraid of myself because– I don't know, I'm just terribly mixed up.

P: You haven't had any trouble with anyone close to you?

S: Close to me? Well I've been married three times, and uhm– close, you mean as far as arguments or something like that?

P: Yes.

S: No, nobody real close. I'm just a very lonely person. I guess I'm very–

P: There's nobody who loves you.

S: Well, I feel that somebody must someplace, but I don't know where or who.

P: Have you been having some sexual problems.

S: All my life.

P: Uh huh, yeah.

S: Naturally, you probably suspect, as far as the hair stylist and– either go one way or the other. There's the straight or homosexual something like that, I'm telling you my whole life is just completely mixed up and turned over, and it's just smashed and smashed and I'm not kidding.

The idea behind that is, when he names that he's been a hair stylist, etc., he seems from later talk to take it that he's *hinted* that he's a homosexual. It appears then, as one way, and not at all unusual, that there are some categories that identify oneself, which one can hint at belonging in by naming some activity that one does. So that one other way that one goes about doing identifying is by 'hinting.' And it involves picking some activity which has some properties, whatever they may be, which provide for the activity to be hintable with, about some particular category – specifically, some membership identification category.

When the 'hinting' phenomenon is itself subjected to consideration it turns out to be extremely interesting in various ways. One thing which will turn out to be of interest for our consideration of "We were in an automobile discussion" is something like this: One can be found to have hinted at an identification, and if it turns out that you're not a member of that category that you were found to have hinted at, then we don't have a situation where

it's simply a matter of 'correcting a first impression,' i.e., I got a bit of information and it looked like you were hinting at such-and-such, later on it turns out that you're not a such-and-such, so maybe you weren't hinting. Rather, the initial, properly-seen-hint may be used to formulate, by reference to what later turns out to be the case, that you were a *phoney*.

The notion of a 'phoney' is, then, methodologically very important. One of the key things about it is that you can be found to be a phoney about some category that you've never claimed to be a member in. And then one comes to see that doing 'hinting at an identification' does not necessarily at all involve that you intend to do 'hinting,' but that there may be, e.g., things which are said and things which are done which are properly seeable as 'hinting at an identification.' And if you don't intend to hint at the identification that they imply, then you'd better not do that thing.

Just as a matter of indicating where we'll be moving towards, let me point up what that could mean for our data. Suppose it were the case that saying "We were in an automobile discussion" constitutes a way of hinting at some categorial membership. Then, even if it were perfectly true that you were in an automobile discussion, if you are not a member of that category – or not relevantly a member of that category – then you had better say something else. The perfect correctness of what you announce, and the fact that you might have said it and meant nothing more than that it was true, does not control what can be made of it.

What we then need to consider in that regard are the following sorts of things, which we can consider by reference to the fact that we've done them, and can then consider some of their import. Somebody calls up your house, you answer the phone, they ask what you're doing, and you lie. What are the kinds of things that you'll find yourself not telling somebody that you were doing? There are some that are specifically illegitimate or private or whatever else. But there are a lot of things that you'll find yourself not telling somebody that you were doing which, say, you know perfectly well that anybody does on some occasion, but which would permit a formulation of the sort of person you are, which for some reason or another you may not want to have. Or, for example, somebody knocks at the door and you're doing something. And now you don't just stop, but you remove its traces. The magazine you were reading, you stick away. You may not turn the television set off, but change the channel. And it's interesting in its fashion that persons will do that for anonymous audiences i.e., it used to be a funny thing in the television monitoring systems for finding out what programs people were watching, that they might say they were watching Walter Cronkite, at any hour of the day or night, when they weren't even watching television. It's interesting in that they're controlling an impression of themselves for somebody who couldn't matter less in some fashion.

So there's that sort of thing in which conclusions are apparently known to be arrivable at, by reference to such observables and such reporteds. And if you happen to be caught directly, you might say I just turned it on, I never watch it, I never read it, only this time, etc. Alternatively of course, there's

that sort of activity which involves arranging matters when somebody is expected, so they will find, incidentally, something on the table which they can then use to see what sort you are.

Now the thing is that it may perfectly well be true that you bought and read this month's magazine of that sort. But you'd better not have it on the table unless the kind of inference that could be made about you will stand up. Otherwise, that it happens to be perfectly true that you read this week's issue, or every issue this month or this year, is not sufficient for it to have been there, i.e., somebody will see that and treat it as a known usable event. If they then find out that whatever else they figure such a one as reads that magazine does, you don't do, then it's not just that you happen to be reading it, but you're 'a phoney.'

What's interesting is that you can be a phoney at a whole lot of things, and that each of those are arrivable-at in the same way. And again, there's no issue of merely revising earlier impressions, but those earlier impressions are treated as having been produced so as to *get* them, which then permits the assertion 'phoney.' One doesn't, then, want to constrain 'hints at identification' to those produced by reference to an intention to mislead or an intention to correctly identify, but one wants to allow that 'hints at identification' have the scope that permit identifications to be made which can then be found to be 'phoney.' One comes, then, to see that if some matter is relevant to identification, that, independently of the issue of it happening to be true, correct, or whatever, it nonetheless, in its utterance, in its presentation, whatever else, is to be controlled by reference to what identification will be made, given it. With respect to our data, "We were in an automobile discussion," then: If that's a thing that could be hinted with, then it ought not to have been asserted unless that 'hint' were known to have been correctly placed. And 'correctly' doesn't mean necessarily that it's true that they are such people as do it — whatever category that is. It could as well mean that they are trying to put something over on somebody.

One can then see another partial constraint on the use of statements like 'We do X' or 'I do X' or 'I was just doing X' or 'We were just doing X,' etc., which is that independently of whether it perfectly well is true or not, its assertion can have consequences which operate to provide that you should say something which, while on the occasion of its utterance is not true, might otherwise be true. That is, if they're asking you something that they're going to use to make an identification, then answer with that sort of thing which permits a correct identification, independently of whether, when you happened to be found, you were doing it. I take it that people find themselves doing such things all the time.

Let me now go on to a piece of data and a discussion to go with it, to deal with a slightly different but obviously very intimately related set of usages. If there is some statement that's known, and one wants, e.g., to show that a case falls under it without however making that claim on one's own part, one can so construct a characterization that persons who know that known statement will 'automatically' use your material to see that's what you're saying. Where,

that they arrive at that conclusion involves them sometimes in showing that they know the statement also, and know its relevance, and can use it proceduraly.

The simplest cases are, typically again, that sort of thing where somebody says "they always do it," you survey the scene, see a 'woman driver' or some such thing as that, and see that that's what's being talked about. Where the fact that you see that undercuts any claim you might later try to make that women drivers aren't like that – which you could have made if, instead of "they always do that," they had said "women drivers are just terrible." That is to say, there are ways of preventing somebody from playing dumb in ways they might like to do.

There are also ways of, let's say, more or less subtly being prejudicial. There was a time recently when the Soviet Union was accused of being anti-semitic and encouraging anti-semitism among the Russians, and they claimed that it just wasn't true. Now they had a procedure for being anti-semitic which served to permit anti-semites to see what they would like to see, without it ever having been claimed that Jews were after all what everybody knows they are. It works like this: A variety of people were prosecuted for 'economic crimes.' That they were Jews was not claimed, that they were prosecuted because they were Jews was not claimed, no such things were claimed. What was done was that the report of economic crime convictions involved among other things, lists of names. And among the Russians, lists of names may be inspected for such things as, are they Jewish. And given the fact that it's known that Jews are people who do things like that, the question of who these people are could in the first instance be handled by inspecting the list so as to see whether there is information that would tell you that those were Jews. Then the product can be perfectly consistent with whatever one knows, and in that case, then, could be something which persons could claim was encouraging latent anti-semitism.

Now the technique for presenting information which can be inspected, given that persons know what they want to look for, involves finding that sort of thing which stands in some relation to the category they want to find. And while the right names can work to locate all sorts of things (i.e., to encourage anti-semitism you would have to pick people with good names, since lots of Jews don't have 'Jewish' names), names are not always so usable.

I have, with regard to categories hintable-at by naming an activity, used the term '*category-bound activities*.' And that notion will be to some extent applicable to some of those things that I've been talking about under the form 'Y do X' (which are regularly hintable-at). The notion of 'category-bound activities' is extremely gross, and there are much finer ways that activities and categories can be useably related to each other. So I want to offer the following sort of caution.

Once students have that sort of notion at hand, they then use it to preserve in their discussions the kinds of things that they had begun to get cautious about saying. That is to say, in the first instance you might have said "Therapists behave in such-and-such a way." You might then get cautious

about using such a statement. You may however, go on to say "That therapists behave in such-and-such a way is category-bound to being a therapist," and figure that you can then use it in precisely the same way as you used "Therapists behave in such-and-such a way" to draw your conclusions about, say, how *this* therapist behaves. Whereas, first of all, what you always have to do is begin with: "It's a known thing that therapists behave in such-and-such a way." The inferences that are permitted from that are not anything about how a therapist behaves, or how any given therapist behaves, but what it is that might then follow as an inference that persons who know that 'known thing' make.

Our discussion so far about such kinds of known things is that they're known quite independently of whether each given person you happen to encounter, does them. One of the marvelous things about category-bound activity phenomena is that you could conceivably perfectly well say "Negroes are such-and-such, but every one I've ever known is an exception." Now that means that if you're doing a study you cannot use such things as methods for generating results of the sort: 'They are known to do such-and-such, he did it, therefore he's a such-and-such.' Instead, you might find yourself in a position of having to say something like: 'They are known to do such-and-such, he could be found to be one of them, and therefore he might be expected by Members to do that,' or ' . . . that would be used to explain why he did it if he did it,' or ' . . . they would find that what he was doing was that very thing.'

Even that, however, is not yet anywhere near good enough. What you have to do is, each time that you want to say that something is a 'category-bound activity,' have some way of proving that it's so. Where the fact that you know that it's so in the first place, only sets up the problem of proving that it's so. Now what are the ways of proving that it's so? Some of them we've already gotten. That, for example, the category is hintable-at by naming the activity, is one way of coming to see that it's one of those. But even here, you have to be able to show that what took place was a 'seen hint' or a 'seeable hint' – or a 'wrongly seen hint' as in the case of the 'phoney' situation. There are lots of ways of proving that something is category-bound to some category, and I'll try to give some instances of ways of proving that next time.

Lecture 13

Category-bound activities: "The baby cried;" Praising, warning, and challenging; Tautological proverbs

I'll start off with the consideration of how you'd go about proving that something's a category-bound activity, giving one instance of such a thing. Then I want to pick up a few other considerations, and deal also with some of the reasons why we need the notion 'category-bound activity.'

I'll take a perfectly plain statement that would initially seem to refer to a category-bound activity: *"The baby cried."* Everybody knows babies cry. If there seems to be no interest in that, then we'll see right off one aspect of what import there is for dealing with an utterance that it turns out to be a case of; i.e., 'Category, plus category-bound activity bound to that category.' And that is that there are perfectly good ways in which a statement like "The baby cried" is ambiguous, which one wouldn't see. And that one has a situation where the separate parts, when put together, turn out to produce an ambiguity that is not expectable; that would not be found – though if pointed out it is perfectly obvious. That is one of the things that category-bound activities do.

In the case of 'the baby,' the phrase 'the baby cried' is perfectly understandable, under the assumption that the 'baby' is an 'infant.' But the term 'baby' is used with quite different kinds of intentions also. If it was used as 'the baby of the family,' 'that's my baby,' things like that which do not have the meaning 'infant,' if you then have a statement "the baby cried," "my baby cried," it would be something quite different if it were referring to an 'adult' who happened to be being called 'baby.'

Consider things which are quite parallel in their fashion, e.g., "Catholics often confess" and "Criminals often confess." There are lots of them, and we can see ways in which, while just by reference to the components one would figure them to be quite ambiguous, they turn out not to be heard as ambiguous at all. Where I'm taking as a given, the fact you wouldn't merely select the category being used by virtue of the fact that it's true, since a lot of them would be true, and in any event, being true might be quite incidental. But you're intending to point out that, e.g., 'people confess to crimes,' where, then, you would presumably pick, for a single case of it, "a criminal confessed," even though that criminal might also be called 'a Catholic.' But to say "a Catholic confessed" might be doing something quite different than confessing to a crime. Likewise, if it were an 'adult' who cried, even if he were

584

the person referred to as 'the baby of the family,' you might well not say 'the baby cried,' but something quite different than that.

The selection of a category, then, can have some impact in resolving potential ambiguities; that is to say, making them not-arisable; under, of course, a circumstance where you're not dealing with, e.g., machine translation, but with another Member, who knows the categories' uses. You might be using terms which are ambiguous, say, dictionarywise, but by putting certain combinations together you will not get misunderstood in ways that you perfectly well could get misunderstand in intending to point out the 'same' action with the use of other, correct, terms.

Now how do we go about showing that 'baby' and 'cry' have this characteristic of 'cry' being category-bound to 'baby'? The procedure I'll use is rather more general in its capabilities than handling 'baby' and 'cry,' though it is not by any means the only way of doing things like this. Let's suppose for now – and in a while I'll consider how it is that we don't have to leave it a supposition – that in one sense of the term 'baby,' it's part of a set of what I'll call '*positioned categories*:' 'baby' . . . 'adolescent' . . . 'adult.' The dots mean that there are other categories in there, in various places. By 'positioned' I mean such a matter as, that 'B' could be said to be higher than 'A,' and if 'B' is lower than 'C' then 'A' is lower than 'C,' etc. And I'm not specifically intending that by 'higher' or 'lower' what we'll be talking about is anything like the mere fact that there's an age progression. That is not what is key to a positioned category collection.

So we have a collection that has positioned categories. The category we're dealing with is a member of such a collection – a member of at least such a collection; in the case of 'baby' it would be a member of other collections, e.g., 'family.' Where 'family' does not happen to be a collection of positioned categories i.e., 'baby,' once applicable to somebody, is thereafter indefinitely applicable – you remain 'my baby' until I'm dead. The term in its collection of positioned categories wouldn't get such a use.

If there is an activity 'bound' to some category of the positioned collection, then one thing that we may find about it is that if a person is a member of another such category and does that action which is bound to this category, then he can be said to be 'acting like an X,' that X being whatever category the activity is bound to. And when "You're acting like an X" or things to that effect are said, that turns out to be one of two sorts of actions. If the activity is bound to a category lower than the one the person is in, then the statement is a 'degradation.' If the activity is bound to a higher category than he is in, then the statement is 'praise.' So that, say, in the case of an 'adolescent' found to be crying, they can be said to be 'acting like a baby' and that statement will be seen as a 'degrading' remark. And if we process 'cry' through this kind of thing, we find that it's bound to 'baby' in even a stronger way than we need, but in a way characteristic of these things also, which is: If there are circumstances such that for a 'baby' to cry it would be quite appropriate and he doesn't, then, for one, what we get is one of those 'doesn't do X' statements of absence, i.e., that he isn't crying is noticeable.

And it also can be said that he's 'acting like a big boy,' which is seen as 'praise.'

You can then use those 'acting like an X,' 'looks like an X,' etc., types of statements to begin to get some of the data relevant to proving that some statement you want to show to be category-bound is or is not. And you can collect, e.g., the specific damning uses of categories, i.e., where you say about somebody 'he's an X' where it's not true, on an occasion of seeing that the thing he's done is category-bound to 'those people.' There are a bunch of things which are specifically named objects, now named by categories: 'Jewing him down,' 'doing Nigger-work,' etc.

On the issue of 'positioning,' the reason one doesn't merely want to talk about 'age progression' as an obvious base for saying that what seem like age-type categories are positioned, is that it perfectly well could be the case that while, say, 'adult' is higher than 'adolescent,' it may also be the case that 'old man' is lower than 'young man.' In regard, then, to positioning with respect to some problem, you would have to be able to determine that there was positioning, and what that positioning was. And a kind of way to get at that may be something like the following. Let's suppose that 'boys' and 'men' are relatively positioned to each other, 'men' being higher than 'boys.' Suppose also that a member of the lower could become a member of the higher. Consider the case of somebody who's a 'boy.' For 'boys' there's a bunch of things which are seeable (by audiences or by the boys) as 'dangerous.' A lot of things that are 'dangerous' for 'children' are not 'dangerous' for 'boys;' other things, that are 'dangerous' for 'boys,' are not 'dangerous' for 'men.' When something arises that's 'dangerous for such a one,' then that one can be 'warned.'

Now the very fact of 'warning' about something is informative to the person being 'warned,' of the classification that's being made of them. That's plain enough. You can make jokes like that. The depth of a wading pool that a little kid can be warned of, can be used to jokingly denegrate a full-grown man by warning him of it, thereby proposing that he's that sort of person, i.e., a little kid, where he's obviously not. So, the very act of 'warning' can be informative about the kind of formulation that the warner is making of the warnee.

Further, there's a wonderful kind of ambiguity involved in receiving warnings. That is to say, what one who receives an observable 'warning' can make of it, involves that observable 'warning' in having alternative possibilities. The big thing is that a 'warning' can be heard as a 'challenge.' In fact their linguistic forms, for example, are often quite indistinguishable. Now, that relation of 'warning/challenge' can turn on the categorial positions of the warned – possibly challenged – person. Specifically, if a 'boy' is warned *qua* 'boy,' and turns that warning into a challenge, then he takes the, now, 'challenge' as a chance to prove that he's not in the first instance – or is no longer – a 'boy.' We have a kind of 'testing boundary' which on the one hand can be set up and used by virtue of 'challenges' made. Alternatively, it can be set up and used by virtue of things that are not intended 'challenges' turned

into such things. So that there are a bunch of things you can prove you're not a member of, not a member of any more, by some successful response to a 'challenge.'

That that sort of thing obtains between categories, i.e., that there is provision for some movement, would seem to capture at least part of the sense of their being 'positioned.' It is by no means all the ways in which any two categories that we figure are 'positioned' are in fact 'positioned' – some may not provide for any movement. But then there might well be other procedures which can involve us in seeing how that they are 'positioned' is to be found. But for one, what seems to be involved is that if you're using the phenomenon of 'positioning' to handle the 'category-boundedness' of some activity, then you have to deal with 'positioning.' And that may be an altogether independent task, involving altogether different procedures, etc.

Now there's a bunch of other things that one could look to for getting at category-boundedness in some way other than 'we think they're category-bound.' You could consider the distribution of the *tautological proverbs*: things like 'women are women,' 'boys will be boys.' The occurrence of those things tends to be involved in one way of marking that some activity took place which is category-bound to the named category. I found the following incident in a book called *Washington Wives* by an extraordinarily brilliant woman who was the wife of a congressman in the period of about 1890 to 1915, and she wrote observations about Washington at that time. But she came from a very old Virginia family, and at one point she reports a story that took place in her youth. It goes something like this (and we've heard parallel things many times): Some woman is brought to trial for being a 'common scold,' which was a misdemeanor in Virginia at that time (it may still be for all I know). The woman's lawyer goes through a whole big thing about what a wonderful person she was, took care of the family, etc., etc. Finally the judge inquires what she was like, relevant to what she's been accused of being like, to which the return is "Well your honor, women will be women."

That's just the way these tautological proverbs occur. They are not merely announcing what is perfectly well true for them, i.e., women are of course women, but they're pointing out that some thing that they're dealing with, some occasion that provides for their occurrence, involves an activity which is category-bound to that category. Now, in the case of 'boys will be boys' I have a much nicer instance which involves an occasion in which President Johnson had a conference with a bunch of congressmen, after which somebody gave out a version of what had taken place. That created a big storm, which forced out the real version – which was apparently quite different than what this guy had given out. So then Johnson is asked about this whole story and he says, "Most of the time when you tell people certain things in confidence, they treat it that way. But some very partisan politicians or other mischievous types just can't be held to that, and now and again you get into trouble. You know, boys will be boys." Here, the appropriateness of 'boys will be boys' by reference to, say, mischief-making, is doubled by the use of the category 'boys' to degrade what wasn't a 'boy.' So you can get that

kind of a combination. But wherever you get a specific occurrence of one of these tautological proverbs you can lock in on something of the sort we're dealing with. They're not merely logicians playthings, and by no means 'platitudes.' They do quite a specific task.

I want to point out a couple of things. One of them is that this feature of *'programmatic relevance'* I talked of earlier, is something that seems to be not merely an analyst's construction but is specifically learned. Kids seem to learn that thing as a special phenomenon, and learn it quite early. When I was working on the notion of 'programmatic relevance' and the phenomena it dealt with, a friend of mine came up with this piece of data: He'd just come to California, they had a four-and-a-half-year-old daughter who had been told all about California before they came. One day it's pouring rain out. She's standing at the window and she says "It never rains in California." Now if she was older that could be ironic. Her whole statement was, "It never rains in California. Silly rain!"

And the kind of extension she was making of a phenomenon, is perfectly plain. That is, she's at that point where people are saying to her things like, "Big girls don't go potty on the floor," where that sort of thing, 'You're a big girl now and big girls don't do that,' is asserted at the point that she has done it. And that teaching technique is precisely the technique that gains for the kid, as a generalizable concept, this 'programmatic relevance.' That she has a concept is available in the most simple way, i.e., by virtue of the fact that some thing which is a case of this, which she has never been specifically taught, is invented. So there's that aspect of 'programmatic relevance.' It isn't something that was just made up and doesn't characterize a real thing. It may be perhaps an object not heretofore named, but it is something that is surely as real as a different sort of mushroom is, even though until now it didn't have a name.

Finally, I just want to mention what is in its way the most important use of 'category-bound activities.' We can start out by noticing that the problem of *selecting identifications* is by no means a simple one. It is in principle never the case that persons are simply faced with applying a correct identification. And the procedures whereby they then go about selecting identifications in systematic ways, are a major problem for us. Now one whole range of ways that identifications get picked, turns on category-bound activities.

In the first instance, *a* way that you go about selecting an identificatory category – given, say, that some action is going on, done by some person – is to determine if there is a category-bound activity of that sort, and if that person is a member of that category, then use that category to identify them. Now those kinds of things are not just 'correct descriptions,' they're correct descriptions in quite powerful ways. Most particularly, these sorts of correct descriptions do not, in themselves, pose problems. Whereas lots of category-and-activity combinations will pose problems like "Why in the world did that happen?," "Gee, isn't that unusual," in the specific cases in which you've got a category-bound activity and the category for that applied to some scene, *why*

the thing happened is not a question. That it happened is explained by the very characterization.

Again, one might want to play with picking categories other than the category-bound activity category, for an announced activity that is category-bound to some category – where that alternative category you pick is also possibly correct. E.g., if the baby crying is also Catholic and you announce "The Catholic cried," you'll find that you get into lots of queries which you wouldn't otherwise get. What's involved then is a whole range of ways that identificatory categories are selectable, and are indeed selected.

Lecture 14
'Cover' categories; Omni-relevance

The stuff I want to develop now has interest for our data, but also has some more general interest. So I'll begin in a way that seems rather indirect and unrelated, but get to our stuff eventually.

The application of the categories of some collection to a population, is an operation that can be talked of as 'partitioning' a population into various categories. One consequence of that operation – in the first instance for analysts, but then perfectly obviously as a matter that's oriented to – is that we get a population that can be considered to be composed either of co-members and cross-members of some categories, or of all co-members or all cross-members. So, for example, application of the categories of the collection 'sex' to any population will give you the partitions 'male'/'female.' Then, there might be three people, two males, who are co-member to each other, and cross-member to one female. There might be two people, one male and one female, giving you 'all cross-member,' or two people, both males, giving you 'all co-member.'

It's perfectly plain that this co-membership/cross-membership feature is something that can be relevant to the participants, and, furthermore, that it's a kind of thing that can be relevant independently of which collection happens to be used to find the categories into which persons are partitioned. That is to say, persons use a notion of co-membership for more than *a* collection. They don't just talk about being co-members in, e.g., the category 'male,' but they may talk about being co-members, by reference to other collections' categories, i.e., co-membership is used also for 'race,' 'religion,' etc. And in that sense its use holds for each collection across various of the collections. And either co-membership or cross-membership can be relevant for all sorts of activities. Some things are not appropriately done unless persons are cross-members, other things are not appropriately done unless they are co-members. And sometimes the fact that they're co-members can provide for various activities independently of what they happen to be co-members in. So co- or cross-membership is not, then, simply something that we, as analysts, can assert as a consequence of an 'identification problem,' but it's a feature that persons orient to.

Now it's perfectly well true that persons do not always use, for some population, only *a* collection of categories. They may use several, and if you give them enough time, they may use many. If they use several, you can obviously get on one use, some relationship of co- or cross-membership, and on another, a different relationship, i.e., for one collection they're co-members, for another they're cross-members, etc. And it will be in that

590

direction that we'll move with our material. But I want to introduce the notion I'm going to develop, on other material.

I was once reading some of the literature on child training in various cultures. And one question that regularly is considered in child-training literature is, when is it that a culture begins training persons for various future memberships the culture might have. Now there's a way of considering that problem by formulating, for some matters, when they *possibly* could begin training. And that turns on there being systematic relations between various collections of categories. Such that, given one collection and now considering a second, the relevance of which will arise later, you can say what a member of a category of the first might be eligible for with respect to the second. If there's a perfect relationship between membership in a category of the first and membership in a category of the second, then persons could begin to be trained for that second, however soon you wanted to start. Whereas if there weren't such a relationship between the first and second collection, the beginning of training might have to be delayed until, say, a further formulation of those persons was available.

So, for example, if 'male'/'female' partitioned a population in such a way that eligibility on 'husband'/'wife' is controlled by status in 'male'/'female,' persons can, from the outset, be trained to be an adequate 'husband' or an adequate 'wife' by virtue of their being 'male' or 'female.' And in some societies you have a situation where all 'females' are expectably 'housewives,' and there's only one occupation for 'males.' Then you can begin to train 'females' immediately for being 'housewives,' and to train 'males' immediately for their sole occupation. And indeed it appears that in some societies, very early in play, children are being engaged in training which is controlled by such kinds of situations obtaining. So two- or three-year-old children are preparing for 'adult roles.' Alternatively, in some societies there's no one occupation for 'males' – there may be several or many – while nonetheless 'females' are to be 'housewives.' In that case you could begin working on 'females,' preparing them to be 'housewives,' while you may not be able to begin training 'males' until something else comes about. Or perhaps there's some combination which can be immediately arrived at, e.g., 'male' plus 'mother's brother's occupation' – or, again, training might be delayed by some such selection procedure. So you could have those things breaking in quite different ways.

We can talk, then, about 'eligibilities' in terms of the kinds of relationships that various collections have to each other. And we can also see that there could then be some quite simple – at least intendedly universal – relationships between categories, even where some category only becomes operative fairly late in someone's life, i.e., it isn't that they are in the first instance both 'male' and 'husband.' Such a consideration, then, could be used to perhaps account for when training for various things begins.

Now the idea there, is that one wants to deal with splits between populations, while categories are being amalgamated. And one wants to see whether a split on one collection would hold up when another collection was

added, and then to consider whether, say, preserving a split was something that was oriented to. And when we return to local materials and forget about, say, intrinsic relationships between categories of different collections, we can ask about a population, identified, say, in the first instance by the categories of one collection and now being identified by the categories of another, whether there is what I'll talk about as *'partitioning constancy.'* That is, we have persons split, e.g.: A,B,C/D, and we can ask whether that 3/1 is preserved over the addition of another collection of categories. Where what we want to ask is, not whether it just happens to be preserved, but whether that it is or is not preserved is something criterial for doing identifications. And we can say that we find 'partitioning constancy' when it is preserved, and we have 'partitioning inconstancy' when it isn't.

With that sort of thing abstractly at hand, I wanted to look to see whether identifications might be chosen by reference to such a feature. Let's for example note about the population that we have in our data, that if we use 'patient'/'therapist' as categories, then we get A,B,C/D. Also, if we take 'teenagers'/'adult' as categories we get the same. Let's suppose now that the possibility that partitioning constancy holds between two collections applied to some given population, can serve as the following kind of resource. Suppose in the first instance that one of those categories is relevant to some activity. Suppose, for example, you're dealing with a mental patient at a hospital, who is allowed freedom to go into town under certain circumstances – one of them being that he is accompanied by, say, a nurse. If it was a matter of embarrassment or trouble for them that they might be seen as 'mental patient' and 'nurse,' then they might look for a *'cover'*, i.e., something that categorized both of them but categorized both of them in different terms than 'mental patient'/'nurse.' And of course it's the case with lots of mental hospitals, especially those not located in large urban areas, or those in local neighborhoods of large urban areas, that people have as a relevant thing they're looking at, among people who arrive, say, in their store or pass them on the street, whether those two are 'those people.' And the 'cover' would be a kind of thing that permitted concealment of such a fact – where 'covers' are, specifically, identificatory techniques directed to concealing some otherwise relevant identification.

We might ask what kind of constraints are there on building 'covers.' And we could consider such things as the narrative literature on mental patients' problems, or more specifically, technically, problems of spies. Having 'cover identification' is one basic problem that a spy has. And what it consists of in part is, they have some itinerary they have to go through; people they have to meet, places they have to be at various times, etc. And what they need is some identification or set of identifications which operate to provide that, under that identification, they're legitimately meeting this person, legitimately being in this place, etc. It's in that context that the notion of 'cover' has its most technical formulations. So that, then, a given task may be assessed to find the kind of formulation of a person that your spy ought to have, to be in that place, meet that fellow, etc. Where, what would be

necessary is not merely that he can say that he's a machinery salesman, but that he's able to support the assertion. And that, furthermore, his actions are not inconsistent with being such a person.

When you consider the notion of a 'cover' with respect to, e.g., a spy, you can see that, first, the properties of a single person's identification, and then also, properties of series of persons' co-identifications, need to be assessed, to find other identifications which can be used to mask the first. And, say, in the case of a mental patient, it's nice if one can use, e.g., 'possible relatives,' 'a couple,' as a cover when you send the mental patient into town. So that if it's a male patient, you might like to have a female nurse, and if it's a female patient you might like to have a male nurse, such that those two people could be seen as 'another couple,' and could engage in such conversations and such activities as need be engaged in. (Although obviously, for example, if the mental patient is going into town to get a shave, then it doesn't do you much good to have a female nurse around; you need a male nurse and he would have to be passing as a 'friend.' Wives rarely show up and sit around in barber shops while a guy gets a shave.)

There are, of course, lots of identifications which persons don't want to have to use while they're engaged in some activities which they seem to need to be engaged in, or when they might be discovered to be in some activity. Let me consider this by reference to a thing from much earlier in our data corpus. It's from the first session I attended. I sat in another room, in which there was a one-way mirror. And the fellows were told that I was an observer, and was going to record the session. They dispersed for awhile to get coffee. And when they came back into the room, the following sequence takes place:

A: Turn on the microphone.
B: Testing,
A: We're about to start.
B: We are gathered here on this day,

Something like the following may have been going on, and if so, it's terribly nice. We had a situation in which, there they were, 'patients,' and I was the 'observer.' And that's kind of a pain, and furthermore has a variety of difficulties involved in it which can be clarified when we consider the alternatives they seemed to invoke by the actions I just reported. And that is, 'performer'/'audience.' It's perfectly clear that they were doing a performance, in the sense that what they were doing were 'performance activities,' which are independent of any particular performance, i.e., any performer might do those things. And the 'performer'/'audience' relationship is much more comfortable in a way, than that of 'patient'/'observer'.

Let's just consider what's going on. They're now going to be in a position where they're talking to each other while I listen. Overhear. That's a rather special circumstance, somewhat close to eavesdropping which is specifically illegitimate, such that if you detect somebody overhearing there are ways of sanctioning him, and of course there are lots of ways of detecting that persons

are overhearing. Now the situation of 'performer'/'audience' is one where what is specifically legitimate is that some group, the 'performers,' talk among themselves without participation of the 'audience,' while nonetheless directing their remarks in part to that 'audience.' It provides, not merely for my legitimate presence – which was in part provided for by my status as an 'observer' – but it provides for their legitimately orienting to my presence, in what is a perfectly conventional format – 'performer'/'audience' being widely used and having just those properties. In that regard then, one can say that – as sociologists love to say, and I love to say – it would not be expectably accidental that they would have invoked that formulation. It handles very neatly a series of specific problems. And it handles them while preserving that all the various participants stand to each other as they did under the initial formulation, i.e., 'performer'/'audience' splits things up in the way that 'patient'/'observer' does.

In that regard then, one can imagine that they could – being in some situation where some identifications are operative and those identifications have consequences and split persons in various ways – find that one, or those others, which retain the split while providing for some activities to have different bases. What we're moving towards as a possibilitiy is that the phenomenon of partitioning constancy could be used not simply with regard to, say, our characterizing actually-used pairs of collections, but might in the first place be used by participants in selecting from among alternative collections. And that it might be so used especially where one such collection was, say, 'unavoidably relevant' but needn't be mentioned, and where another could be used to handle at least some of the events in a more comfortable way.

With that kind of background I want to introduce another notion called *'omni-relevance of a collection.'* What I intend by that – and there are a series of things I don't intend by it – is this sort of thing. Suppose some course of action is taking place, like a 'group therapy session.' Then, some collection of categories is 'omni-relevant' if on the one hand there are some activities whose effectiveness turns on categorial membership in that collection (and by 'effectiveness' I mean, for one, that the sheer seeing that something being done is intended to be such-and-such an action, or that that observable action is legitimate, may involve reference to that categorial membership) and on the other hand, until the course of action is ended one can't rule out the further use of that collection (i.e., even if it isn't being used right now it might well be needed or invoked at any point up until the end of that course of action; e.g., the 'session'). Again, then: On the one hand there are some actions which, for their effectiveness, involve categorial membership in that collection, and on the other hand, until the course of action is ended, one can't rule out the further use of that collection.

What I want to be able to say is that 'therapist'/'patient' is 'omni-relevant' for the 'group therapy session.' I don't want to say that it's the only collection of category used or usable in the session; that would clearly be absurd. And I don't want to say that it's the only collection that's omni-relevant; there may

be many that are omni-relevant. It is one omni-relevant collection. Now, how would we come to see that it's one omni-relevant collection. If there were some activities that might need get done in the session, for whose effectiveness categorial membership in that collection was criterial, then we would have a beginning of moving towards omni-relevance. We would have it if we could not at any point rule out its further introduction. And one way we could get at not ruling out its further introduction would be if it were the case that an effective end to the session were something that was to be found in, say, some action of that person who, for purposes of that action, is to be formulated as 'therapist.' And in our data we have an extremely nice such usage:

Ken: I still can't figure out what the hell I spilled on my shirt.
Roger: Alright I give up what's on your shirt.
Ken: Kill it! heheh hhhehh
Al: That's not loud enough. KILL IT!
Roger: You're gonna bust his tape recorder.

((light laughter))

Dan: Well what's new, gentlemen?
Al: That's a hint we must get outta here before he gets mad at us.
Roger: We adjourn to lunch now.

It's not that he merely announces 'Session's over,' but that what he does is something seeable as a 'hint' at that, where its seeability as a 'hint' turns on seeing him as 'therapist' for that activity as a possibility. There's a double character of 'hint;' he's hinting at closure, and also – in the sense that we talked about hintable identifications – hintedly invoking his 'therapist' status. And here, the effectiveness of the action turns on his being seen as 'therapist.' For the newcomer Jim, what Dan was doing at that point, if anything, might not expectably be known – and that is presumably what Al is informing Jim of (if that's what he's doing).

There are other such phenomena in the sessions. At one point in the course of a discussion going on, Ken turns to Roger and makes some remarks about Roger's being able to pick up a radio that Ken is repairing, later on in the afternoon. Then we get:

Dan: Ken, why don't you make these arrangements out of here.
Ken: ((very quiet)) Oh.
Al: Yes, Teacher.
Ken: ((cough))
Dan: Is that what I sounded like for a moment?
Al: Yes, Teacher.
Dan: What'd it make you feel like?
Roger: Like it reminded us that we're in group therapy
Al: I felt like back in school

Where again, the effectiveness of "Why don't you make these arrangements out of here" is in its being observable in the first instance as not merely a 'proposal,' 'suggestion,' etc., but as a 'rebuke;' seen as a 'rebuke' via his status as 'therapist.' Though of course in this case you have an equally nice alternative, which is that instead of, as they might, saying "Yes Dr so-and-so," they use a collection which partitions them again in the same fashion, and which also would have that action as effective, i.e., 'teacher'/ 'student.' But insofar as the possibility of bringing order to unruliness, or bringing closure is doable or done by virtue of categorial membership in 'patient'/'therapist,' the category being 'therapist,' then we can say that 'patient'/'therapist' is omni-relevant.

While 'patient'/'therapist' is omni-relevant, there are some transparent reasons why participants would like it to be minimally used. They might then look to the selection of alternative ways of formulating as much of what goes on as they can, while perhaps, say in the ideal, allowing that the 'therapist activities' or the 'patient activities' or both, could be handled via an alternative formulation than 'patient'/'therapist' and nonetheless come off. For example, that they could do a good deal of what they figure they have to do as 'patients,' without formulating 'patient' as the thing that is involving them in doing what they're doing, but, for example, 'teenagers.' And that could work if, roughly, they could have a discussion going which any set of 'teenagers' might have going – at least in terms of its 'topic' – and where, in the course of it they can deal with whatever they figure they ought to deal with as part of the business of 'therapy.' That would set up a lot of nice things. For one, if, say, it's the case that they're going to have an 'automobile discussion' as something 'teenage boys' are occasionally prone to have, then while there is in 'teenager'/'adult' and 'patient'/'therapist' this kind of partitioning constancy, one nice thing that takes place is, you have a general account of why that guy doesn't talk very much, i.e., it's not a topic that interests him very much, *qua* 'adult'. There is also a reversal of expertise; i.e., they're the ones that know about those things, not he.

Lecture 15.1
'Safe' compliments and complaints

I've been talking about relationships between collections of membership categories for some population, by reference to how the various collections *partition* persons into co-groups and cross-groups. What I'll be considering now is the way partitioning might be relevant for the doing of some activity. And I'll focus on how an orientation to the way some collection of categories partitions a given population, can be used in formulating specific cases of certain activities. I'll be talking particularly about 'compliments' and then I'll make some additional remarks about 'complaints.'

First, here is the data we'll be considering. It's from another one of these group therapy sessions. What has happened is, there is a girl in the group, Louise. At one of their sessions she says she's going to have to quit because she got a job. At the following session we get:

> *Ken*: So did Louise call or anything this morning?
> *Dan*: Why, didju expect her t'call?
> *Ken*: No, I was just kinda hoping that she might be able to figure out some way t–to come to the meetings and still be able t'work. C'z she did seem like she d–wanted to come back, but uh she didn't think she could.
> *Dan*: D'you miss her?
> *Ken*: Well in some ways yes, it's– it was uh nice having– having the opposite sex in–in the room, you know, havin' a chick in here.

What I want to focus on is part of the technique used for building such compliments as 'it's nice to have you around,' etc. I want to talk about a class of compliments I'll call *'safe compliments.'* I'll discuss the criteria for 'safe compliments' by reference to one way that persons can go about making them – where our interest in that is via these considerations of 'partitioning.' The rough idea is that there are a good number of ways that one could go about building a compliment for someone, where some of those ways may be selected by reference to – not just identifications of the complimented person, but identifications of that person relative to usable identifications of the other members of what turns out to be a relevant population.

The first thing that we want to notice is that what is proposed to be 'nice' is 'having a chick in the room.' And the collection that that involves is 'sex,' with the categories 'male'/'female.' Now, she is the only member of the relevant population who is a member of that latter category. Furthermore, it happens that in this case there are only two categories and all the other

members of the population are members of the same other category. It could be the case that there were three or four other categories, and while the person being talked of is talked of via some category of which they're the only member, it might also be the case that others are in various other categories, not that all the rest are in one other category. The fact that there are just two categories and that she's in one and all the rest are in the other, can turn out to be relevant to doing 'safe compliments.' That is, for some person who is possibly going to be complimented, one might want to find a collection such that, of the relevant population, that person is the only member of one category and all the others are members of one other category.

For a compliment like 'it's nice to have such a one around,' one aspect of the way such a location of a person as I've just described is 'safe,' is by virtue of the fact that by using that location one does not set up such a thing as one might get if you said, e.g., "It was nice to have somebody with a sense of humor in the room," or "It was nice having somebody smart around," at which point others might say "Well what about me?" A great many proposed compliments can be treated as allowing for classification of the other parties present via the same category, and rejecting those parties as so classifiable. Where, then, those sorts of compliments can be considered to be 'implied characterizations' of the others.

In that regard, then, one aspect of a compliment being 'safe' or 'weak' turns on the fact that a category is used as part of the compliment, and that category has no other local incumbents. There is a perfectly obvious sense in which such a thing can be said to be 'safe.' And of course it is not specific to the case of 'females' where all the rest are 'males,' or for that matter 'males' if all the rest are 'females.' It can be used and is used with classification of personnel via other collections satisfying that kind of constraint for a given population.

As it happens, for a thing like "it's nice having the opposite sex in the room," there are other ways it's 'weak' or 'safe,' turning on the fact that you're not only not implicitly categorizing the others by reference to your criterion, but also it's the sort of thing that any member of your category might say about such a one. That is, you're not going out on a limb by reference to the other persons in the same category you are. Where it might well be the case that even if the 'no other local incumbents' constraint held, there are things you could say which could set up an argument among your co-members. For example, at one point they're talking about the time when they had a Soshe in the room, none of them now present being in that category. Somebody proposes that it was nice having one around. Somebody else says, "No it wasn't, because as long as they were here I couldn't be honest." And there are other ways that co-members might propose that what you said wasn't true.

One could easily enough construct controversial compliments within a group, e.g., "It was nice having a Negro in the room," by virtue of the partitioning being 'white'/'Negro' with all the co-members being 'white,' to which some other might say "No it wasn't at all," i.e., that's a thing that all

'whites' don't agree on. And furthermore, not only don't they agree on it – lots of 'males' might not agree that it's nice to have 'females' around – but it's something that they can perfectly well announce without having their status as a member of the group brought into question. That is, if any male says it's nice having a female around, it's fairly hard to get another male to propose that it's not, while being able to retain his position as a sane member of the category. So in the case at hand, the compliment is additionally safe by virtue of the fact that any other member of the category he's formulated himself as a member of by reference to doing this compliment, could do it in just the same way, and without an argument getting set up.

There are two ways, then, that such a statement avoids argument. One is that it is not 'implicitly categorizing' others in the room, and the second is that any co-member might have done it. Of course there can be issues by reference to what is a 'co-member,' where what the complimentor selects might be perfectly appropriate for such a partitioning as 'male'/'female,' but not something that all persons present would agree to. Suppose for example, there was a teenage girl, three teenage boys, and a 70-year-old man. Then, if one of the boys said it was nice to have a member of the opposite sex in the room, the 70-year-old man might feel it incumbent upon himself to say "It would have been nice 50 years ago," in which he would have been slightly disaffiliated from the compliment. But you aren't going much out on a limb if you build compliments with those two properties, and compliments are regularly built like that. We can also see how 'safe critiques' could be built in a similar fashion.

Now let me point up a related way that *'safe complaints'* can be done. And 'safe complaints' could be contrasted with 'unsafe complaints.' We have a rather neat case – a little bit neater than we need in a way – at the beginning of one of the sessions:

Al: Hey you have a hole in your shoe,
Roger: heh Do(hh)n't tell me hehh
Al: This place costs too much money. Can't afford to buy shoes.
          (/ /)
Roger: 's breaking my folks.
          (/ /)
Ken: A(hh)h
Roger: My insanity's breaking their bankbook.

Now Al's remark, "This place costs too much money" is a complaint, let's say, on behalf of Roger in the first place. But to make the case more simple, let's say Roger had said "This place costs too much money." The character of a 'safe complaint' involves in this regard that he is situated with a bunch of others, and can use co-categorial status with respect to something else, to formulate a complaint. Ideally, say, all members but the person or object being complained of, are co-members of an alternative category. And the complaint is formulated as such a thing as any member of that category could

say about that other. And that stands in contrast to such a thing as, while you are a co-member with others, you formulate a complaint which such co-members don't make. Or you formulate a complaint about co-members. Or about the category of which your co-members are co-members.

There are lots of 'safe complaints' in the data; things like, 'cops pick on us,' 'it's all their fault,' etc. And those are the kinds of things for which one is in quite a different position making them in one group than in another. That is to say, any of these 'safe' phenomena would have different characteristics depending on how the given population were to be formulated. And of course one then gets a basis for seeing a typical mythical history of persons' careers, in which they start out being seen as heroes within their group by doing what sounds like strong complaints which turn out, however, to be 'safe complaints' in that they're the sorts of things that their co-members would agree with – using them to achieve high position, at which point they no longer make them. I say 'mythical' because it's known independently of cases being available to be used as examples. But, say, American images of a politician for otherwise weak groups, have just that picture in mind: He becomes a member of the establishment.

So we can come to see quite generally that the way collections partition populations can have varieties of consequences in doing – in particular ways – what might be not a small number of activities. And also, to see that some version of an activity – like a 'complaint,' like a 'compliment,' like a formulation of an identification of a population – has describable alternatives in terms of those category collections and how they handle populations. In that regard, then, this phenomenon of how a collection partitions a given population, can be of specific interest.

Lecture 15.2
Ultra-rich topics

I want to go on now to talk about some aspects of the phenomenon of an 'automobile discussion.' I'll start off with a long quote from a wonderful chapter of a nice book. The book is called *The Nuer* by E. E. Evans-Pritchard, and the quote is from chapter 1, pages 18–19; a chapter pretty much on conversation among the Nuer.

> We have seen in a brief survey of some Nuer institutions and customs that most of their social behavior directly concerns their cattle. A fuller study of their culture would show everywhere the same dominant interest in cattle. For example, in their folklore they're always talking about their beasts. I used to sometimes despair that I never discussed anything with the young men but livestock and girls. And even the subject of girls led invariably to that of cattle. Start on whatever subject I would, and approach it from whatever angle, we would soon be speaking of cows and oxen, heifers and steers, rams and sheep, he-goats and she-goats, calves and lambs and kids. I've already indicated that this obsession – for such it seems to the outsider – is due not only to the great economic value of cattle, but also to the fact that they are linked in numerous social relationships. Nuer tend to define all social processes and relationships in terms of cattle. The social idiom is a bovine idiom. Consequently, he who lives among Nuer and wishes to understand their social life, must first master a vocabulary referring to cattle, and to the life of the herds. Such complicated discussions as those which take place in negotiations of marriage, in ritual situations, and in legal disputes, can only be followed when one understands the difficult cattle termi-nology of colors, ages, sexes, and so forth.

If we consider in parallel an 'automobile discussion' for teenagers, or for hotrodders, then some of the kinds of things that Evans-Pritchard points up would seem also relevant. What I basically want to do now is to pick a couple of aspects and give them some strong formulations. It's easy enough to say "they always talk about cattle," etc. To be able to show that some such things are going on is quite another sort of problem. My main interest here is, I want to be arguing that something like 'category-boundedness' holds for an 'automobile discussion,' for teenagers. Where, however, it's perfectly well the case, and perfectly obviously the case, that adults, male adults, etc., also have

---

601

'automobile discussions.' In that regard, what we want to do is show that an 'automobile discussion' is something special for teenagers, for 'hotrodders.'

What I'll try to do, then, is to show that the way it's special is that for them it's what I'll call *'ultra-rich.'* One aspect of a topic being ultra-rich is that we can have ways of showing that it's 'inexhaustable.' Now, saying that something is inexhaustable and finding ways of showing that it's inexhaustable are quite different sorts of things. And in the procedure of coming to see how it's inexhaustable we will come to see differences in an 'automobile discussion' for teenagers and for adults.

The procedure is very simple. Let's begin by supposing that we can talk about a car as having a finite set of parts. And there is an obvious way in which you can talk about a car having a finite set of parts, by reference to manuals of parts or production techniques, etc. Now suppose also that for any given part there's some finite amount of things you could say about it. Under that kind of formulation, you can see 'talking about a car' as something that involves cutting into the amount of talk you could do, i.e., you could go through the subject from A to Z, proceeding to exhaust it.

There is one kind of fact for 'hotrodders' that's relevant to a formulation of the infiniteness of an automobile discussion, and that is that any part of any car, under any shape it's in – brand new, right off the assembly line – is replaceable. Now that's not so for adults. If I were to tell somebody that, e.g., I just put a new engine in my car, they would ask "Was the other worn out?" And there are a set of ways in which I could go about accounting for a proposed replacement of some item. The issue is now not so much what I could do, but the ways such matters in fact seem to get handled.

The grounds for replaceability for a 'hotrodder' are in no way like the above. They are a series of different kinds of grounds – one of which, of course, is that something is worn out or destroyed, but others of which – and which are equally acceptable – are 'a new one has come out that's better than the one we have,' or, given the set of things that you have in your car, for that combination a new X is better than the one you have. So that any given replacement implicates the rest of the parts of the car, i.e., if one starts out by intending only to replace the engine, one may find that, having replaced the engine you ought to also replace the rear end to set up an optimum combination. In that regard, when one buys a car one is not doing what an adult does when he buys a car.

And it's not just that any part is replaceable, but any replaced part is replaceable also. So that having replaced the engine, and then the rear end so as to satisfy the engine, it may turn out that now something else is to be replaced to satisfy the rear end and then ultimately that the engine is to be replaced to satisfy the new combination. And furthermore, all these things are available to be talked of as matters being 'planned,' i.e., the grounds for talking about replacements of parts, and even replacements of replacements of parts, are not that it's been done or is being done. And one needn't restrict consideration to the first series of replacements, but you can plan on getting a 387 such-and-such right now, and after a while replacing it with something else.

We're talking, then, about a car – any car – as having an infinite set of parts, under the usual formulation of 'infinite,' i.e., any set is 'infinite' if, under any finite formulation of it, one more is addable. And in that regard then, if any part is talkable about, the conversation is inexhaustable by virtue of it having an infinite store of topics, i.e., the parts.

You can see, then, perfectly legitimate topics which are distinctive kids' topics. You might well bring up, as an adult – or as a female for that matter – that you're going to get a new engine for your car. I doubt that it would occur to you to propose that you're getting a new engine now and that will then be replaced by another engine. Or, for that matter, it seems that there are kinds of replacements you can't propose. For example, you can't say you're going to buy a new Chevvy and take off the body and put on an old Ford body.

Now the tremendous generativeness of this kind of thing is twofold. For one, some guy may have such plans as I've just propposed. The second is that for any plan that seems to be okay, given the fact that every participant allegedly has the same motive – to build the fastest car – then every such plan is thereby a proposal that a hearer has to take into consideration for his own car. And again, you reach a point at which you're not talking about an adult phenomenon. That is, if I propose that I just replaced my engine, somebody will ask me how come, and when satisfied, that's that. It is not for them a consideration that, given that I did it, maybe they should do it. Further, there's not some local set of conversants whom one uses as the exclusive persons who can propose a plan for their car which you need consider for yours. Rather, it's the case that if C comes into a conversation between A and B, and says that D told him that E replaced his engine with X engine, then all parties present have it as a thing to be considered. And again, one can set that up for adult consideration. Consider the possibility of coming home and reporting that you're going to replace your engine because you heard about some guy who met a guy who replaced his engine. This is an absolutely admissable statement for hotrodders. Where, again, one of the things that we have to consider is that for an adult, certain possible replacements having consequences of requiring other replacements, provides as their consequence that a new car should be bought. For kids there's no such requirement. The notion of a 'new car' is something altogether different. A new car is not something that is to be driven as it happens to be purchased, but that one now goes to work on.

What you have, then, is a situation where the community is the set of possibilities. And anybody's formulation is assessable by all others by reference to themselves, properly to be rejected only by virtue of the fact that it was wrong for him to have done in the first place. That is, one decides not to do that sort of thing for one's own car in the strongest way – by determining that he shouldn't have done it for his. Again, that sort of procedure is not appropriate for adults talking about cars, though there are things for which it is appropriate for adults in talking about, e.g., gardens, perhaps.

If it can turn out that the set of constraints we come up with for kids talking about cars excludes, say, adults talking about cars but holds nonetheless for other things that adults talk about, we can have an extremely nice way of seeing some topic as 'central.'

Let me just note that if you look through transcripts in which kids are discussing cars, or listen to them talking about cars, you'll find that there is an extremely limited environment under which the word 'car' will occur alone. That environment is pretty much a question, e.g., "Do you have a car?" Otherwise, there are a variety of other terms than just 'a car.' 'Fast car,' 'gasser,' 'stocker,' brand name, model, 'Voodoo,' 'Roadrunner,' all sorts of things like that. That's a fact that might have some importance, not only with respect to the special kind of phenomena an 'automobile discussion' and cars are for kids, but it may be a partially discriminative feature of a class of objects in general. So, to indicate the point cross-culturally as well, in this chapter of Evans-Pritchard's *The Nuer*, he points out that the Nuer never talk of 'a cow.' They talk about a 'good cow,' they talk in terms of its color, its histories, its type, who owns it, etc. They don't talk about 'a cow.' And again, cattle are perhaps in some ways parallel objects for the Nuer to cars for teenage boys. The feature that one doesn't talk about 'a car' may then be one that has some criteriality for a characterizable class of objects, which furthermore may be a cross-culturally operative class in some fashion or other.

Lecture 16
Possessables and Possessitives

This time I'm going to consider the possessive pronoun 'my.' It comes up because in the data we have a phrase, "In that Bonneville of mine." Though there are some relevancies to what I say about 'mine' that will hold for other possessive pronouns, consideration of those others is an independent problem, and what I'll be saying about 'mine' in particular, does not directly hold for them. I'll not only talk about the possessive pronoun 'mine,' but also to some extent about 'possessions,' insofar as they turn out to be relevant to uses of possessive pronouns.

To start out with, you can feel pretty comfortable with a notion that if something is called a 'possessive pronoun,' then it must be indicating 'possession.' I say you can feel pretty comfortable about it because even quite recently, anthropologists studying notions of possessions, say, among primitive tribes, figured that the possessive pronouns were a great resource, and what you could do was collect things which had possessive pronouns, possessive prefixes, possessive suffixes, and use those to find out what the 'objects of possession' in such a culture were. But that was subjected to some criticism, and that kind of literalism on the name 'possessive pronoun' is something we would figure to be merely quaint.

Rather, a first thing we would do in considering the use of possessive pronouns, is to break down a bunch of types of uses – of which 'possessional' use is one, but by no means the only one. Here are just a couple – there may be, for all I know, a thousand more: You can use 'possessive pronouns' when you're engaged in asserting *affiliation*. And that could be done with some membership category plus a possessive pronoun; 'my family,' 'my country,' and things like that. They can also be used with respect to the *relational* categories, e.g., 'my brother,' where those are something different than the first, and different also than, say, 'my car.' And they also work in ways that are different in at least quasi-grammatical ways. So that, for example, if you're able to say 'my country,' and now there is something that is a possession of that category 'country,' then it's pretty much the case that you refer to that possession, not as 'mine,' but with the use of the first-person plural: 'My country' – 'our bases.' 'My country' –'our flag.' Where you're not, by virtue of being able to say 'mine' with respect to, say, 'country,' entitled to say 'mine' with respect to its possessions, but you can say 'ours.' And in the case of the relationals there's no automatic relationship at all. So that if you say 'my brother' and now you're referring to a possession of his, it's just, e.g., 'his chair,' 'his toothbrush,' etc. There are circumstances in

which you can say 'our' something-or-other, but that's another issue, and you normally get at that a different way.

So there are at least those three things; possessional ('my car'), affiliative ('my country'), and relational ('my brother'). And if you were an anthropologist 20 years ago – or perhaps if you like to construct psychiatric versions of the history of language – you might have treated the fact that 'my' is being used, as indicating that there is some 'possessional intention' in the sentence, i.e., you could figure out the way that 'my brother' and 'my finger' are similar kinds of objects to me. But you could just as well reject the classification of them as 'possessive pronouns.' After all, that was invented by somebody; they weren't always formulated as 'posessive pronouns.' And they don't necessarily work alike. You want to get to the kind of regulation there is, and implications there are, in the use of 'mine' with respect to the various objects.

Now, what I want to do first is to talk a bit about 'possessions.' The reason for that is, when people started to say that you couldn't use a posessive pronoun to formulate the fact that something is a possession, and therefore you couldn't use the fact that persons produced a sentence with some object and a possessive pronoun as evidence for the fact that they were intending to mark posssession, they proposed that you had to work out independent ways in which something was to be seen as a possible possession. (And that seems to be the right direction. You'll note that one of our first results is that you do need independent determination of whether something is a possible possession, to say that given the use of a possessive pronoun and some object, possessional reference is intended – as compared to affiliative reference, relational reference, etc. – where we don't want to be saying that somebody is claiming possession because they say 'mine' or 'my,' etc. They might be, but that needs independent consideration of the object being talked about.)

But they then got into an issue of what are the criteria for deciding that something is a possible possession. And the question of the choice of criteria is not terribly easy to solve. What we find is some tendency to proceed by constructing quasi-legal formulations; things like, 'something is a piece of property if it is produced by the labor of man,' or, '. . . if it has value,' etc., and then trying to see how well such a conception will acount for natives' uses of possessive pronouns with respect to possible possessional objects.

I have no idea about what, ultimately, that sort of criteria would look like. However, the orientation that we're adopting is to try to focus on recognizability for Members. And that leads us to proceed in such a way that what become interesting are things like this: Somebody stands up in a classroom and says "Who's hat is this?" where what's of interest is, it's not only that they don't know who's it is, but that it's anybody's hat is something which is not necessarily the case. That is, given that they don't who's hat it is, for the analyst it becomes now a way of seeing that there is some object never before seen perhaps, which is known to be 'a somebody's.' Seeing a case of the class 'a somebody's,' you can recognize that it is 'owned.' Those classes of things are then, specifically, recognizably, 'property.'

I want to introduce two words to handle a distinction I want to make. Leaving aside the word 'possession' which we could use in its ordinary sense, we'll talk about 'possessables' and 'possessitives.' A *'possessable'* is something that anybody can come to own. If you find it and you want it, it's yours. A *'possessitive'* is specifically something from those classes of things, of which, seeing one, you see something that is owned by somebody. There's this kind of image: You're walking around the world, there are all kinds of things you see, sitting in all sorts of places; things which are not, for example, in somebody's direct control. For some of them, were you to pick them up, you could feel assured that you might be considered a thief. For others, you could perfectly well take them if you wanted them.

For some of these, it turns on where they happen to be. One of the big problems about 'possessitives' is, since a person encountering them sees that they're somebody's, they're kind of hard to get rid of. You have to do fairly special things to get rid of them in such a way that people will see that that is your intention. For example, the proper place of cars is in the street. When you walk along the street and you see cars sitting there, you know that each of them is somebody's car and somebody put it there. Now that means if you want to abandon a car and have it be known that you've abandoned it, then it's pretty hard to do. The place you would normally abandon something would be on the street, where you abandon lots of things. But it's very hard to detect that a car sitting on the street is an abandoned car for anybody to pick up. I'm not making this up; it turns into a major problem in urban areas. Lots of people abandon cars, they sit on the street, somebody figures they may be abandoned, but nobody knows. Now, cars are increasingly becoming things that you can see as possibly abandoned in the streets, and it is becoming possible to bring some car to a police lost-and-found (although earlier you would have been found odd by virtue of that), and go through the procedure of leaving it for a certain period and if it's not claimed it becomes yours. But even then, for cars and things like them, you don't just pick them up, you have to turn them in, and then they become yours.

With that line of consideration you could begin to formulate which objects are 'possessitives' and which objects are 'possessables' by seeing what objects you could turn in at a lost-and-found, that would be accepted at such a place. There are lots of things you can turn in that they would reject – though that doesn't mean that the objects are not of value, that you couldn't own them as a matter of pride, and things like that. It does have this consequence of course: If you couldn't turn it in at a lost-and-found, then if you own it you'll have to be careful about it. If it's a rare rock that you found on the beach and that you love and you keep in a case, if you stick it out on your front lawn, somebody's liable to pick it up, not figuring that it has those characteristics. And again, if they did figure it had such characteristics, and, seeing it out on a lawn, figured it was lost, if they walked up to a lost-and-found with it they might be laughed at. So what you get then is, with 'possessables' you have to keep more care of them than with 'possessitives,' independently of their

'value' – apart from the issue of not being able to turn certain things in because they weren't 'lost,' they were 'just lying there.'

Another way to begin to make the differentiation between some sorts of objects is, some 'possessitives' are usable to claim things with. If you stick a book on a table, other people don't sit down, they figure the table is occupied. While if you stick yesterday's newspaper down, or a pencil, what happens then? And you can then be seeing persons' orientation to the recognizability of particular objects they've never seen before, as 'somebody's.' And also as 'somebody's in various differentiations: Somebody lost it, somebody left it, somebody put it there for a moment, etc., all without respect to knowing who it is or what their habits are, whether they're careful or not, etc. In that regard, then, 'possessables' and 'possessitives' turn out to be quite different sorts of objects, generating peculiar troubles, having peculiar implications which, under this formulation, we can come to see and to understand.

Further, this distinction sets up solvable socialization problems. Children have got to learn all those differentiations. A kid comes home with something, "Where did you get it?" "I found it." As we've seen, there are things which, if you find them they're yours. There are also these things which, if you find them then somebody lost them. And the sheer fact that the bicycle was just sitting on the street and nobody was occupying it, doesn't mean that you found it. Part of the education of kids, then, in some fashion or other, has to be in seeing what it is that's 'somebody's.' And also, seeing when it is that somebody who they don't know has given up possession of a thing that would otherwise be that other person's property – a rather sophisticated little task.

And with that kind of formulation we can see some kinds of interesting things in the following piece of data. This is from the book *One Boy's Day*, Barker and Wright (1951), pages 379–380. The boy is seven years old. He's been playing with a crate which was at a lot at which there was a house which burned down, the lot still owned by the guy that owned the house. Now he's having dinner with his family.

Father:	What are you going to do with that big crate you have?
Son:	I'm going to bring it home.
Father:	You are? Don't you think we have enough crates and that kind of stuff around here?
Son:	((no answer))
Mother:	What are you going to do? Use it for a tent?
Son:	Yes.
Mother:	Maybe Mr Nelson wanted it. Did you ever think of that?
Son:	No. He was going to burn it. He doesn't want it.
Father:	How do you know? Did you ask him?
Son:	No.
Father:	Are you sure?
Son:	Yes I'm sure.

Mother :	Was it there where they usually burn things on that rubbish heap?
Son :	Yes.
Mother :	How are you going to get it here?
Son :	I'm going to put it on my wagon and bring it over.

Now he's seven years old, and he can see at this point that some definitive formulation of Mr Nelson's intentions with respect to that crate is available by the movement of that crate around the lot. So that, at the point that it's on the rubbish heap, it's available for his removal. Note about that kind of thing, he doesn't have to know Mr Nelson very well to know the way Mr Nelson treats objects with respect to rubbish heaps. It's Mr Nelson's problem that if he happens to put something on the rubbish heap, that this kid or somebody else would figure that they have rights to pick it up. And for that matter, the issue is not simply that Mr Nelson's wanting to burn it means that Mr Nelson has every right to burn it – he may have pyromaniac tendencies or whatever – but that having placed it there for burning, others can figure that he wants to get rid of it and therefore they can take it. (And in that regard, let me just note that there's an occupational difference between 'beggars' and 'scavengers' which consists of: Beggars ask people for things, are required to say "Thank you" in such matters. Scavengers go to those places where, if people don't want things they leave things. And they owe nobody nothing.)

You can work out how elaborate a kind of analysis is involved in being able to make those differentiations – though of course there is tremendous emphasis placed on little kids to be correct on such things. They can be correct at quite early ages, and can know how to be correct. And in that regard, then, my initial formulation of the 'recognizability' matter, and talking about 'finding' and 'seeing something as owned,' is directly appropriate for an issue like kids coming to know what are 'possessions' in these various different senses of possession. Such that it's a possession for now, of somebody unknown, and furthermore, that it may be lost, etc., with respect to a set of different objects. It's presumably the case that not everything that would be found on the rubbish heap could properly be assumed to have been intended to be burned – though that may well be an arguable matter.

And you can – if you can find the material – focus on the way that, how parents deal with remarks like "I found it," are progressively incorporated by kids as criteria for examining the world for possible acquisition, possible things to be returned, etc. And you can begin then to get a mild sense of awe at the utter casualness with which somebody will turn up at the lost-and-found with a thing that somebody lost. It's an elaborate kind of organization that has to be available to them, to just see 'There's something somebody lost.' Also, of course, there's the importance of conforming to proper ways of disposing of things, where there can be all kinds of trouble if, when you want to throw something out, you throw it in an inappropriate place. It'll keep returning.

Lecture 17

Claiming possession; Emblems; Pro-terms and performatives; Utterance positioning

I'll be making a variety of observations, working roughly off of the phrase, "In that Bonneville of mine." Now, the general point I was making about the possessive pronouns was that one has to have some formulation of the objects in combination with possessive pronouns in order to determine that the pronoun might be used posessionally, in that there are a variety of other uses; 'affiliative,' 'relational,' and the like. That's one sort of issue.

Another sort of issue is, *which* possessive pronoun is going to be used. And the general point I want to make is that for formulating the rules of use of a term like 'mine,' consideration with regard to 'address' is fundamental. That is to say, the use of pronoun is not stable, and consideration of who is talking to whom, in the environment of whom, is necessary. The one who says 'that car of mine' may also say on some occasion 'that car of ours' or 'that car of yours.' One cannot infer from some appropriate use of 'that car of mine' that the car is owned by that one, or, by treating 'mine' as an alternative to 'ours,' suppose that only that speaker has the right to say 'my,' whereas if he said 'our car' then you could figure there would be others who could also say 'our car.'

That various objects get that kind of variation is, I think, very plain. And not all objects that get some of the variations get all of the variations. That is to say, 'car' and 'house' are not, apparently, treated the same sort of way. So that people in, say, a family can say 'our house' and can say on some occasions 'my house,' and the same can be done with a car. But with a car it might also be the case that they might say, for example to their mother 'your car,' though they might say when talking to their friends 'my car,' while they would not, apparently, say to their mother 'your house,' nor would they say to her 'my house,' though they would say 'our house.' There is, then, that instability, and that instability is in some ways structured by reference to matters of 'address.'

Now I want to make two points. One of them is that possessive pronouns are not exclusive means for asserting or claiming possession. The other expands the 'pronoun' phenomenon in a different direction. So: Possessive pronouns are not exclusive means for asserting or claiming possession. There are various other means whereby the same kind of work can get done. And they can be at least mildly interesting means themselves.

Consider a fairly characteristic utterance. The kids are talking about a movie:

> *Ken* :   I never saw it before 'cause I was on the ranch when it first came out.

The use of 'the' next to things like 'ranch,' apparently in contrast to the use of 'a,' seems to be treated as possessional. That is one alternative way of hearing 'the ranch;' there are obviously others, one of which is 'that ranch that has been mentioned before.'

It's kind of interesting that hearers, dealing with a first reference to some object via 'the,' regularly don't find themselves asking 'which?,' but figure that what they're hearing is not merely an assertion about some particular one – which 'a' would do as well – but some particular one which is in some way owned by this speaker or somebody in relation to him. Why that should be so is a matter of at least some curiosity. It might well be something like the following, though I am really quite uncertain. It's simply speculation. What they may be hearing is what they take to be a usage appropriate in some other environment where, that the object is a possession is already known, and it gets referred to as 'the something.' So that, for example, people in a family talking about its possessions regularly talk about a possession they have singularly with, simply, 'the.' "I want to take the car," "I'll be up at the ranch." Now that usage is well enough known, independently of knowing the objects that any given person might refer to with it, such that if one hears somebody talking about an object which, in your specific environment, they might have first introduced in some other fashion, one can apparently hear it as 'being referred to in the fashion conventional among some other people, of whom this one is one.' But in any event, things like 'the' plus some possessitive can do the work that possessive pronouns also do.

You can get mildly subtle interchanges turning on that sort of thing. Here's a case. It's at the beginning of the two-hour session from which our material was excerpted.

> *Roger* :   'Ey you got the matches,
>   (/)
> *Al* :   Yeah, I got some matches,

I was just initially curious that the second usage was "some matches," where that Roger was claiming anything by "the matches" is not necessary, i.e., he could be saying 'my matches,' 'some particular matches,' etc. But Al is apparently attending the possibility that Roger is claiming those matches for himself, which is kind of relevant in that if he says, e.g., "Yeah, I've got them" and throws them to Roger, then perhaps he can't expect that he'll get them back. And putting in some indication about claims to ownership is at least relevant for that issue. Now they go on, and apparently Roger is mildly puzzled by this return, and he says "What – did I take some?" and Al just

laughs. A couple of minutes later we get:

Al: Hey throw me my <u>matches</u>.
Roger: Your m— um <u>Your</u> matches, she gave 'em to <u>me</u>,

And that issue seems to have turned originally on Al's picking up a possible
sense of "the matches," making his possible claim, and then reasserting it
when the matches, having been used, weren't returned. So parties can attend
to the fact that 'the' plus a possessitive is used, and it can apparently be a
matter by reference to which possessional intentions are heard, where it can
then be a focus for, e.g., a quarrel.

   Now, the combination of the possessive pronoun and the object is not
definitive of the kind of inferences people figure they can make, but that there
is a distribution for the instability of use of the pronouns, is available across
the actual pronouns used. That is to say, there are things for which somebody
can say 'my such-and-such' where the persons hearing that can know that
with regard to them you could say 'my such-and-such,' but with regard to
somebody else you couldn't say that. Persons may well be able to see various
things about that usage which the assertion 'my' does not conceal – matters
like how it was acquired. In that regard, then, the question of what kind of
effectiveness a term like 'mine' has, would have to be raised. If somebody says
'mine' with respect to something, it's not only that they don't have to be
taken at face value, but there are rather specific kinds of inferences, quite
different than one might in principle propose, that are directly makeable.

   What I want to be able to get to is, roughly, how it would be the case that
if a kid says "In that Bonneville of mine," others can take it that that's the
car his father bought him, at best. Or it's really not his car, it's his mother's
car. In any event, that it's not a car he bought. I'll just sketch out a line of
argument. Let's consider a class that goes under the name '*emblems*.' Things
like medals. Now the thing about those is, if you have them, they're not the
sort of things that persons are fully puzzled by how you acquired them. If you
have them, they're assumed to be had rightly. The question – if there is a
question – is, which of the rightful ways that these are acquirable, did you
acquire them by. So that, for example, if you're asked what you did to get
that medal and you say "Nothing," that will not be heard as a description,
but as 'being modest.' And the same, with certain variations, can be heard
with respect to, e.g., wearing a fur coat.

   That kind of fact is important, in that one doesn't want to *define*
'possessions' – again with respect to how they're seen – by reference to the fact
that they're purchased. If they are 'possessions' what's seen in the first place
is that they were purchased. So that the circumstance under which that they
were purchased is a question, is very special. Persons who are seen to be
driving a car that they might not have purchased, get stopped. And the
question is, then, one on which there is doubt.

   Now I want to expand on the phenomenon of 'pronouns' in a different
direction. I'll begin with a quotation from an article by Uriel Weinreich, 'On

the semantic structure of language,' in Joseph Greenberg (ed.), *Universals of Language*, page 126.

> All languages have 'pro-forms' such as 'he,' which substitute for other forms to avoid their repetition within a unit of discourse considered as 'the same.'

That explanation you can forget; it's ridiculous. But that's not the point. He goes on:

> But pro-forms are on the whole very unevenly distributed with respect to the parts of speech. Perhaps all languages have pronouns, but few have pro-verbs. English is perhaps unique among European languages in having, in 'do,' at least the rudiments of a verb-phrase substitute.

That's roughly to say that 'do' works something like the same way that the more familiar pro-terms, i.e., pronouns, work. So that if we have a thing like 'John put on his hat and he put on his coat,' the 'he' there is characteristic pronoun usage. And for 'do,' you'd get something like 'Mary baked a cake and so did Jane.' What we have then is the idea that pronouns are not the only kind of pro-form, but there seem to be other pro-forms, maybe not as widely used, or at least not as widely known.

A question that raises is, are there pro-forms for each class of proper word classes? What kinds of things are there? You start off with the class 'pro-verbs,' and we have a member, 'do.' And you can find in our data that 'do' is used for verbs in a way similar to the way pronouns are used for nouns, with tremendous regularity. All I intend to do now is to indicate that 'do' is not the only proverb, by giving another case and suggesting some of its workings. Where again, that's only intended to open something up. One could perhaps find all kinds of other pro-verbs, and perhaps pro- other things.

The pro-verb I want to talk about somewhat is 'say.' What I want generally to propose about 'say' as a pro-verb is that it's a pro-verb for a class of verbs which have been studied in a famous, brilliant series of articles, and the class is called *'performatives.'* There's a wonderful book entitled *How To Do Things With Words* by the British philosopher J. L. Austin, which is about 'performatives.' Also an article in his *Collected Papers*, entitled 'Performatives.' Now 'performatives' are things like 'I promise,' 'I bet,' 'I claim,' 'I doubt,' and things like that. Where what's crucial about them is that in uttering such a phrase you're doing the action it characterizes, reports, or names. By saying "I promise," you can 'promise.' By saying "I bet," you can 'bet.' Our point is that 'I say' is a pro-verbial phrase for such performative phrases.

There are certain very important constraints on performatives, and one is that not any of the forms of the verb or any of the pronouns for that class of verbs that work as performatives, can work as performatives. Only first-person indicative use, and present tense. So, "he promises" is perhaps a report

on somebody's promise, it isn't the doing of a promise, whereas "I promise" is. That holds for the performatives and it also holds for their pro-verbs. 'I say' is quite different from 'I said.' 'I said' may name that a quote is to follow. But 'I say' is not, e.g., a preliminary to quoting what I said to myself and haven't yet uttered. What it's doing is announcing that I'm doing some case of the class 'performatives.' For example, 'asserting,' 'promising,' 'betting.'

Then, the question 'which one?' is a similar problem to the categorial use of pronouns. Recall that somebody can say "They always do it" and a hearer can, with some examination, determine that some categorial is intended. As a pro-verb for performatives, a similar kind of operation is involved for 'say,' And that it's heard as a pro-verb for a performative would be evidenced from the differences in the ways that what's said in combination with it could be attacked. You might say "I said" plus something, and somebody could say "You didn't say that, you said something else," where in the case of 'I say' plus something, the form of the critique turns on determining what's being done, and dealing with that formulation. If, for example, it's heard as 'I assert such-and-such,' then somebody might deal with it critically by saying "That's not true" or various things like that. If it's heard as making a bet, somebody might take you up on it.

One of the key things that's consequential on the use of these pro-verbs, is that if the use is an action of a sort, i.e., an 'assertion,' a 'promise,' etc., then that thing can be saved for later use by others to watch, for example, for a change in mind, backing down, etc. If, for example, "I say" is an 'assertion,' a position in an argument, it can set up the task of getting the one who made it to change their mind. And then you can get various combinations with "I say." So, for example, in our data this fellow Ken has this utterance, "I still say though that if you take a big fancy car out on the road . . ." etc. And with "I still say though . . ." what he can be seen to be doing is reasserting or re-claiming, in the face of some opposition.

Now this is not intended to be worked out here, but my guess is that a combination like "I still say though" can be informative. And in this case it might be informative to the new entrant, in a series of important ways. That is, they were in an automobile discussion and now they get back into it, and what "I still say though" indicates is, first, that such a position as is being asserted now was asserted before, by the same speaker. And, that in between the assertion of it and the current reassertion, somebody else asserted something in contravention to it. So that the very phrase "I still say though" can be informative that they are in the course of an 'argument.' "Still" and "though" can then position the "I say" within some course of talk, and, as modifiers, can then indicate that the person is being 'stubborn,' etc., and asserting this stubbornness via such a formulation. And of course the phrase "I still say though" can be important in various other ways, one of which is, if this is one side of the argument, then it's perhaps possible to figure out what the other side is.

You can look at uses of "I say" by reference to the class 'performatives,' and see whether such utterances are dealt with differently from, e.g., "I said,"

and also differently from other pronominal combinations with 'say' – and, furthermore, to see whether they are dealt with by reference to formulations of what performative is being done with "I say." If some structuring is made available that way, then one can work it out, look for other pro-verbs, etc., and in any event come to see that pronouns are not the only things that are pro-terms.

Lecture 18
Paradoxes

This lecture is not included in this volume. It deals with paradoxes, and an earlier run can be found in this volume, in the Spring 1966 series, lecture 21. A later run can be found in the Fall 1967 series, lecture 9.

Part VI

Fall 1967

General Introduction

I have one suggestion as to what would constitute a helpful background (as compared to no background, which is quite alright), and that is, some book of Goffman's like *Presentation of Self in Everyday Life*. What I do has only the following relation to Goffman's work: He tries to – and with some great success – make sociological points turning on the details of ordinary life, such that when you read a book like *The Presentation of Self*, on pretty much any page you come across something that's news to you, which you hadn't noticed, which you could notice, which you can thereafter more or less see going on. (He tries more than that, he tries to put it all together in some sort of package.)

The sorts of things he's attending and the kinds of points he's making in no way stand in a one-to-one relationship with the sorts of things that I do. But nonetheless, as compared to what it is that's available in sociology, that would be the best thing to have, if one wanted some background. If what I'm doing seems strange, then after a couple of days reading in *Presentation of Self*, you might be in a position to feel at home with some of the things I'll try to do.

What you get from Goffman is that there are a lot of things going on, they're perhaps studyable, and the study of them can be assimilated to, or assimilate to itself, interests that sociologists have had, or might have. And one thing that Goffman does is to make relevant to his interests a literature that is not at all designed for that; e.g., there's a place where he talks about the literature on social stratification. Now what he does with that literature is something that its authors had no intention of having done with it. He also makes available to sociological consideration a wide range of things from biographies, novels, etc. (I won't do that.)

I want to give some background on what I plan to do. While the question 'What are you going to do?' 'What is the course going to be about?' might seem quite straightforward, I want first to try to locate the sort of answer I'd like to give by fooling around with the question a little. In a context like this, it would seem to me, anyway, that one partial analogue of the question 'What are you going to do?' is this sort of thing: Children get asked the question "What are you going to be when you grow up?" Now, there's certain rather interesting features about how an answer would be done. First, an answer would consist of selecting some occupation from a list of occupations that are known, available, existing, used. "What are you going to be when you grow up?" "I'm going to be a so-and-so." What a 'so-and-so' might be is something that anybody might know, or anybody might discover by looking at, say, the census list of occupations.

Now if that's the sort of thing that an answer would be, it's kind of curious. (Let me make a parenthetical remark, and I give it as a piece of advice: Somebody once pointed out that when I say something is kind of curious, what I mean is it's perfectly ordinary but that I intend to make something out of it. So when I say something's kind of curious, then a point is about to follow.) Now, "I'm going to be a fireman" and that sort of answer, is kind of curious in this way: If, for example, it were relevant with respect to what somebody finally does, what they answer to such a question, and if the list of known occupations defined the set of possibilities, one would have the expectation that the list of occupations would be unchanging. And that the task of choosing an occupation would not consist at all in, say, the task of *making* an occupation. On the one hand we would, I suppose, find it strange for someone to answer with the name of an occupation that may only develop in the future, but on the other hand, we wouldn' find it strange that somebody at some point tries to build such an occupation and give it a name.

Now, answers to the question "What are you going to be?" don't, perhaps, control what anybody or everbody turns out to be, but it's more conceivable that how they make out in the conversations in which those questions and the answers occur, might well be terribly relevant to what they turn out to be. If, for example, a kid were asked "What are you going to be?" and he said "I'm going to be an atomic scientist," and the questioner was his father, or a teacher, then there are readily imaginable circumstances where the retort to that might be, "No one like us has ever been that," or ". . . will ever be that," or ". . . will be that in our day," or whatever else. Where, again, being able to get along in such a conversation might well be relevant to the kinds of directions you take, etc.

I mention that sort of thing to pick up one feature of the way I take it students attend their classes or peruse the catalogue, i.e., how they understand what a course is about. And that is that the catalogue is a menu. And the way a course is to be conceived is comparatively to the set of items that constitute the catalogue. In that regard, one would want me to answer the question "What are you going to do," "What is the course going to be about?" by some characterization that could be used to place what I do relative to what anybody else does, where for that purpose, that set of categories are treated as just God given. Whereas the set of names that characterize what sociologists do are, perhaps, victories of certain groups, and are more or less legislated, and quarrelled about, and changed any time, say, there's a major change in the field.

If I were to provide a name, then the set of names would be used, within which the name I gave can be placed. And I don't especially want that to be done, as I couldn't do very much about that set of names in the first place. As the field gets well-developed, the set of names tend to have some coherence to them. People do this sort of thing and that sort of thing, and those things fit together in some fashion.

Let me use another partial analogy. Consider the question "What are you doing?" There are some ways in which it would appear that nothing could be

easier to answer. But with respect, say, to the issue of what is to be made of that answer, then let's note that there's a phenomenon of 'field.' In sociology it might be called the sociology of knowledge, intellectual history, etc., which takes as its pervue formulating for itself, as a technical field, what anybody's doing. Where it's hardly very relevant to it what anybody says that they're doing. It stands in a position, say, parallel to perhaps psychology, perhaps sociology, with respect to *your* answers to what *you're* doing. That is to say, you're no authority. And in that regard, then, I'm no authority either, with respect to what I might propose to be doing intellectually. It's a matter of history. It's a matter of somebody else's business. What I can do is what I do, and I might have some say over that. But it's not my business to say, except as an 'informant,' what I figure I'm doing.

As it turns out, that field – sociology of knowledge – has not yet taken over the world. And people feel quite free to announce what they're doing, and figure they can hold others to it. But when it does, that question may disappear, as, say, the question tends to disappear for people who take psychology courses. That is, when their friends ask them "What are you doing?" they may feel terribly unable to find an answer which satisfies both their scientific interests and what they figure to be the question.

What that sort of suggests is that I can tell you something, but you have to be careful what you make of it. And in any event, if what I do lives to have an epitaph, I won't write it.

The upshot of what I've said is this: I make no commitment to what kind of placing anyone makes of what it is that I do, nor to whatever recommendations anyone might provide me, which turn on such a treatment. Now that will be very hard to accept, except maybe under one condition: If said I was doing maybe poetry, then, that one doesn't want to accept somebody's paraphrase, that one doesn't want to treat the various classifications that are available as locating it, as fully dealing with it and equivalent to it, is acceptable under perfectly conventional views of what poetry does. For example, the French poet-philosopher Paul Valéry, in his book on the art of poetry, gives a characterization of it which roughly is: You have a poem when nothing that's a paraphrase of it is equivalent to it; when you have go to back to the poem to find out what's in it.
